THE BUILDERS'
JOURNAL
AND ARCHITECTURAL RECORD

APPEALING TO THOSE ENGAGED IN

THE ART OF BUILDING

IT is our aim, our ambition, our aspiration even, to build our Journal worthily and well, not for the hour only, but for future years; for the few men in the forefront of an enduring and a laborious Art; for the disciplined ranks of a distinguished Profession; for the young men—Architects to be—and for all who love a clustered column or a flying buttress, a traceried window or a Greek frieze, for the man, too, who honestly plumbs a jamb.

An Architectural Causerie.

One's First Client.

IN due sequence and rotation one has cut one's teeth, fallen down stairs,

endured the mumps and, at different times, no less than three, measles; but none of these experiences were so humiliating in the fact nor provoked such irradicable disgusts in the mind as the experience of one's early clients. This is the more remarkable since while one accepted the above physical vicissitudes with

Profession, and, in one's humble way, one has tried to follow his example in this particular. The only misfortune is that one has failed to preserve one's clients with the same unvarying success with which one has preserved one's dignity. Since the first burst of one's early clients were disposed of, it is a fact that one's affairs have somehow languished. One's self-respect and sense of dignity is, nevertheless, strong and rampant, and all one desires is a client who will respect and appreciate these qualities. So far one has not succeeded; however, one continues to wait expectant. What has always oppressed one is the strange grotesqueness of the spectacle of a young architect assailed by his early clients. He is most like to a sheep engaged in gleaning its scanty livelihood, and several rooks companionable upon its shoulders, cheerfully tearing the wool it has been so long and laboriously accumulating to mend their nests, and doing it with a hollow pretence of benefitting the sheep by scratching its back. Personally, by reason of one's instinctive ingrained antipathy to a client in any form, one has only been victimised upon

and pressed cigars upon him to make up for one's past errors. One's client grew quite pathetic to see. He would regard us with a whistful eye, as he turned over how best he could seduce one to his table. At last, in a plaintive despairing key, he said, "Won't you stay here altogether? Wouldn't it be more convenient to you?" One assured him it would not. The work was completed; one's little account had been rendered; one was going abroad, one wanted cash; one went to lunch with one's client and say good-bye. The obvious occasion had come; it could hardly be avoided. One ate hardly any luncheon and refused wine. One never saw a man more broken in spirit than one's client; he yielded up the ghost of his intended parsimony there and then. One saw the moment of its passing; he was resigned to pay. He retired sighing. Then at one's departure he appeared in the hall. As he helped one on with one's overcoat one noticed a bit of paper in his hand. One recognised a cheque. One was held in a passionate interest for this scrap of paper, and kept a fevered eye covertly upon it.

"THE HOUSING OF THE DRAMA." MUNICIPAL THEATRE, LAIBACH.

an air of resignation and without any effort of resistance, yet one's resentments were always fully armed and all one's prickles out at the proximity of clients. One's prime natal quality is suspicion, and from one's youth onwards one has consistently regarded a possible or prospective client with a special blackness of distrust. It is an intuition—a natural instinct of self preservation. The sentiment first sprang, no doubt, from one's delight in first reading those delicious anecdotes of Pugin. If his greatness were established by no other qualities, it would yet stand unquestioned when we recall his magnificent air with clients. One remembers with highest relish the incident of the great Lord who visited the architect's office and attempted to interview him with his hat on. Pugin called his office boy, requested his hat and put it on. "Now, my Lord," said he, "we can talk." That of the Yorkshire parson is also refreshing. The parson wrote describing in terms of magnificence and splendour the parish church his heart desired, and mentioning the price he wished to pay. "My dear sir," Pugin replied, "Why not add 30s. and have a steeple while you are about it." Pugin did much to uphold the dignity of the

a single occasion, and then one managed to save oneself: one was paid in the end. This first client, before he became it, had passed as a friend. That is the essential of the characteristic early client. He is a friend. Upon a certain occasion this one was very brisk, and cheerful, and pleasant, said, "So you are an architect," and wound up with, "When you come north again on your holiday you shall alter my stables for me." Apparently it was a privilege to do the great creature's stables. One swallowed that, but one rose at the idea of it being a privilege to do them for nothing. By that time the works were commenced. One's suspicions were aroused by a nervous prodigality of one's client's hospitality; it was an economic prodigality but very lavish. "Have a pear?" (The biggest.) "Here, catch." "Cigar?" (A handful.) "Fill your pocket." "Cream?" (All of it) "Run for some more." Luckily one saw the strategy in time; how should one have sent in one's little account after four weeks of this sort of thing. Accordingly one became a total abstainer from the client's board. One declined to lunch, one declined dinner, breakfast, and tea; one sent the client game

The ceremonial *congés* were fearfully protracted. It was clear one's client could not bring himself to the point of actual delivery; he fumbled uneasily with one's cheque. In desperation one pressed a cigar; he refused it; the game was up. One saw the bit of paper surreptitiously hidden away in a waistcoat pocket. One said good-bye; but one's labours had not been in vain. A fortnight later the client wrote asking: "Had he understood that one's commission was 5 per cent. on the contract?" One assured him, "Yes, he had." B. C.

A Side Light on the Building Act. THE Metropolitan Building Act comes in for a good deal of abuse from the London architect. We wonder whether it has ever occurred to the said architect that this Act, besides being a standing nuisance, is also a standing reproach. It does not speak very highly for the standard of professional practice, if the municipal authorities have found it necessary to evolve such a fearful and wonderful com-

pilation to keep the architect from jerry-building. Yet this is what a great deal of this Act really amounts to. It also implies that the architect is not to be relied on to put up a public building with due regard to the public safety, that either he does not know or he does not care; so he is told how to construct an exit stair, and which way a door should swing. As it is well known also that every architect looks after his own interests, without the slightest regard for other people, and in utter contempt for the public health or convenience, clauses must be inserted to tell him how to ventilate a w.c., how much area space he should allow at the back of his building for proper light and inculcation of air, and, in general, how to carry out his duty towards his neighbour. We wonder whether architects ever consider how much of this is their own fault? Here we get an Act, full of minute and complicated information, instructing the architect in all those things on which, by the nature of his training and by the fact of his being an architect, he should be the better judge; giving expert information to the expert; in fact, teaching him his business. If an architect does not know his business, neither an official nor a parliamentary draughtsman can teach him it. Was this Act first compiled because it was notorious that the architects did not know their business? or because they could not be trusted to use their knowledge aright? or was it just an example of official meddling? However it came about, the existence of this Act does seem to carry with it a reproach to the Profession, whether deserved or not. But though an Act of this sort may be necessary, there is no reason why it should be so absurd. A treatise would have to be written, longer than the Act itself—both longer and more intelligible—to do justice to the absurdities it contains from an architectural point of view. It attempts to draw hard and fast lines, and to lay down precise rules, where neither is possible. Would it not be more reasonable and better for everybody if the Public Authorities were to devote their energies to obtaining a class of architect in whom they could trust; to raising the standard of professional knowledge and professional etiquette. As it is, they allow any unqualified person to practise, and then pile absurdity upon absurdity, in a vain attempt to safeguard themselves against his ignorance. If they would take care that no inefficient architect should practice, they would be able to allow the competent architect a proper and reasonable discretion. As it is, he has to submit to vexatious and humiliating restrictions, for the sake of the weaker brethren. It is fast becoming impossible to produce Architecture at all in the districts covered by this Act. It is a question, after all, whether a policy of enforcing such schoolboy rules really pays in the long run. We all know that the more cunningly devised the restriction, the greater is the glory in successfully evading it; and when an architect comes across such an absurd and chuckle-headed regulation as may be met with in the Building Act, is it to be wondered at that he makes it a point of honour to get behind the same?

A. R. J.

"The Gentle Art of Advertising."

It would be idle to deny the ascendancy which Americans have obtained over us in most matters requiring push and prominence; it is, however, doubtful if we should care to adopt the various methods by which they have attained their position. In the current number of "A. A. Notes," a contributor furnishes us with a few examples of advertisements by American architects, which he has culled from a maga-

zine. They all possess that "cheap jack" flavour which is so nauseating to the English palate, but is evidently suited to the taste of our American cousins. It must not be supposed, however, that there is any lack of ingenuity amongst English architects in advertising their qualifications, only they do so in a much more genteel manner. It is impossible, here, to exemplify all the methods of the gentle art of advertising, by which the architect can preserve all the decorum of professional etiquette and may, at the same time, secure a plentiful crop of clients. We must simply content ourselves with giving the uninitiated a few prescriptions of "puff" which have been used by architectural specialists with marked success. The theatre architect is, perhaps, more advertised than most specialists, it being a rule amongst theatrical clients to placard the name of their architect all over the building during its erection. This method of advertisement is so akin to the American that it lacks that subtle refinement which is the characteristic of the "professional architect." A much superior mode of procedure is to acquaint a Sunday paper, in the manner which most readily suggests itself to the mind, that Mr. "Architect Brown" has been commissioned by the famous actor, Mr. So-and-so, to prepare plans for his new theatre. The veracity of this statement is not in the least degree important. In the next issue the Sunday paper might contradict the report concerning "Mr. Architect Brown." Eventually if Mr. "Brown" persists in hauling his name before the public, he must get a theatre to build. He should, however, still keep the Sunday paper posted up with information concerning the building. We should recommend fortnightly insertions of his name during the progress of the work. We now turn to the "Art" architect, who is also an adept in the art of advertising. He generally writes articles in some non-professional magazine on a house he has designed, or hopes to design, illustrated with sketches or photographs. If the literary effort is a little beyond the Art architect he can always get a friend to write the article for him, care being taken that the architect's name appears in, at least, every other paragraph. He will gradually get quite an aristocratic *clientele*, possibly Royalty itself, in which case he should inform every newspaper, magazine, and periodical of the fact; after this he may cease advertising—his fortune is made. There are certain architects who don't know much about designing, yet at the same time have established a reputation as "authorities" on Architecture. This is done by writing a book on well-known buildings; the book being properly illustrated by photographs. Previous to the publication of the work, a paper should be read on the subject before some society; the pupils and office boy of the author attending the meeting in order to take the names of subscribers. An advance copy of the publication should be placed on the table. In concluding these few hints to members of the Profession, we would instil into their minds the desirability of signing their names on any building they may erect. Should they possess any degree, the fact should be recorded after their name: The stone, engraved in this manner, should be built into the wall at a height of about 6ft. from the ground level; it will then be certain to arrest the attention of the man in the street.

H. S. M.

ST. GEORGE'S HALL, Langham Place, was recently offered for sale by public auction. The competition was very slow, the first bid being £2000, advancing by bids of £150 until £2900 was reached, when the auctioneer announced that the property "had not been sold."

THE TRADITIONAL IN ART.

BY SIR W. RICHMOND, R.A.

SIR WILLIAM RICHMOND, R.A., in the course of the second of his series of lectures at the Royal Academy on painting, said: The study of history as it is related to the Fine Arts, was as important to the student of art as to the student of ethics. The past could be ours always. The achievements and failures of nations and of individuals were links of a chain that bound generation to generation. They were children of tradition—made up of it—and could not afford to let drop their hold upon its influences. The wise clung to traditions, and made progress by aid of them; the fool threw them away. The oldest were the best, because they were the roots nearest the seeds. His text, broadly speaking, was "Be constructive, not destructive."

THE ARTS AND CRAFTS

of Egypt, Persia, Babylonia, Greece, and Italy were grafted on ancestor-worship. They became exponents of various religious cults, but they exposed the lives of the people, religious, industrious, or pleasant, and were associated with the various movements of their national life. Finally they grew to be materialised expressions of abstract conception, and their highest expression arose from an abstract conception put into ideal human form. Such were the Zeus of Phidias at Olympia, and the Athena of the Parthenon, the Milo Venus, the Ilissus, the Adam of Michael Angelo, and the Sistine Madonna of Raffaele. Individually, as well as collectively, art had been handed down by various systems, personal or gregarious. Personal tuition implied attendance in the workshop, where apprentices were taught their art, from grinding colours and preparing walls to painting pictures; in the crafts, through guilds. In sculpture and Architecture alike the apprentice worked by rule, adopting his master's style. If he were of pronounced mental activity he added to what he acquired; if he were only a good workman he remained a good workman—and that was a worthy achievement, was it not? It was far from unnatural that artists should be inclined to refer to

THE PAST AS THE TEXT

of what should be; living as they did mainly in an overgrown city, in many parts ugly, always dirty. Yet they were the chosen people to reveal beauty—to satisfy a want in the heart of a population, much of it struggling for bread, most of it fighting for riches, and many gambling away fortunes. If Art were once more to take her place and to throb in the lives of every class, it must express national and colonial life by the scope of its application: prosaic, but poetic also. But while that was being done by what one might term journalistic art—very valuable of its kind—the greater arts of painting, sculpture, even Architecture, were in danger of losing touch with traditions. The lecturer then gave a rapid view of Egyptian, Greek, and Pompeian painting, illustrated by a large collection of photographs arranged upon the walls, dwelling especially upon the portraits recently discovered in Egypt, of which specimens were in the National Gallery. The "Aldobrandini Marriage," of which a copy, made by the lecturer's father in 1837, was also shown, was referred to as having itself formed a school, especially in France, of the neo-classic type. All the great Italians were

PROFOUNDLY INFLUENCED BY CLASSIC ART.

Among them Pinturechio produced, perhaps, the most complete and, in some respects, the most beautiful decorative work of his period—the Camera Borgia, ordered by Alexander VI. He did not know any work of the kind more lovely in design and colour. Portions of the Camera were shown in facsimile in the South Kensington Museum, and he would strongly advise any of them who contemplated decorative art as their profession to make that work their ideal. The works of the Byzantine school, of Cimabue and Giotto, the wall paintings at Subiaco, and the mosaics of the Baptistery of Florence were afterwards referred to.

THE HOUSING OF THE DRAMA.*

WITH SPECIAL REFERENCE TO SUBSCRIPTION AND ENDOWED THEATRES.

By EDWIN O. SACHS,

Author of "Modern Opera Houses and Theatres," &c.

IT is the housing of the Drama of which I wish to speak, neither more nor less, and I may as well at once say that the use of the word "theatre" in the title has been purposely avoided, for when speaking of the theatre we are too ready to associate with it the many forms of entertainment which require an auditorium and a stage—from grand opera to the variety show. Similarly, such terms as "planning" and "construction" have been intentionally omitted. To have included

his client's instructions to the best of his ability without dealing with the purpose or object of the building from ideal points of view, much less trying to influence his client in this respect. At the present time, however, I am glad to say that we have architects like Mr. Aston Webb, who will go so far as to give such prosy themes as a grain warehouse an architectural treatment of the very highest order. Moreover, we have architects who consider that they have a higher mission than the mere welding together of bricks and mortar. They intend to beautify our cities and give dignity and importance to our public institutions, and even if commissions do not fall their way, they do everything in their power to see that we are saved from further eyesores. It is to those to whom I address myself chiefly when I deal with the "Housing of the Drama" not as a question of construction but as a question of policy.

Now, when speaking of the one form of entertainment under consideration—the Drama

private theatres cannot be considered otherwise than as having their basis in commercial enterprise. This commercial spirit is but rarely shaken off, even by a management of the highest order.

The home of the Drama in the Metropolis is sometimes a building owned and managed by the same person, who is a manager or actor by profession, or similarly owned and managed by some combination of persons (a syndicate or company), who undertake the direct control of their house through one or more of their number. More often, however, the owner leases his building for terms varying in length from a few nights to a number of years, and the lessee may be an actor, a manager, or, again, some syndicate or company formed for the presentation of an individual play, or a series of productions. In the first case, that in which the theatre owner conducts his theatre directly, his holding principally resembles that of a theatrical business; in the latter case, where he leases his building, the

"THE HOUSING OF THE DRAMA." SUBSCRIPTION THEATRE, PRAGUE. GENERAL VIEW.

either would have compelled me to deal with the playhouse solely from its architectural or technical aspect. That is not my intention, the less because the Institute has already witnessed several interesting discussions on the building and equipment of the modern theatre at home, on the Continent, and in America. In fact, many questions of detail essential to the construction were then so ably dealt with that I should only be traversing old ground; hence, I have ventured upon a contribution on broader lines. I shall endeavour to treat of some of the aspects under which a playhouse devoted to the production of Drama can be constructed not only as a temple of Art, but also as the pride of the nation or community to which it belongs. These aspects demand the attention of the architectural and allied professions, for without the assistance of the architect of to-day and his co-workers, the successful issue of any movement for a better class of building is almost impossible. I say architect "of to-day" advisedly, for it is not many years back that the architect considered it was his only duty to carry out

—as distinct from the opera or the lighter forms of amusements, it would be well to bear in mind that this includes comedy and tragedy alike—the chamber play as well as the Grand Drama—in fact all such presentations of plays which are given with due regard to art and literature as well as for purposes of education, with the object of dealing with serious problems, or for the recreation of the cultured. I am afraid I must exclude the melodrama, and even the ever-popular modern farce.

I ask, then, how the Drama, in its highest sense, is housed to-day? How is it housed in the Metropolis, how in the provinces, how abroad? And what principles guide the constitution of the home of the Drama? What is the basis on which buildings devoted to the presentation of plays are erected? The answers to these questions are all important when considering whether a playhouse fulfils the function for which it is provided. They are also essential if we wish to know the lines on which a modern playhouse should be built.

To begin with, let us remember that London has no other form of playhouse than what is termed the Private theatre. However high a standard may be reached by productions associated with its individual examples, these

property may be considered an investment, which the lessee can use for his own special purposes. The latter may, if he prefers it, make money by pandering to an inferior scale of public taste, or he may wish to entertain, with due regard to art, to educate his audience, to amuse it, or both. He may conduct the theatre with high ideals, or otherwise. But, with very few exceptions, it is inevitable that the theatre owner and theatre lessee must bear in mind the cost of land and of bricks and mortar. Some owners or lessees may have been granted voluntary support or subsidies as regards special efforts on their part. But, as a rule, whether built for direct management or as an investment, the site, the building, and the equipment of a London playhouse are plain questions of rent-roll and £ s. d. pure and simple. What is more—the London playhouse is but seldom erected by the man who can sail an easy course with a large banking account at his back. With few exceptions, we find a most complicated financial basis, in which questions of option, of mortgage and the like predominate. The same holds good for our provincial centres, with one exception, that of the Memorial Theatre at Stratford-on-Avon, which has a special building fund voluntarily

* A paper read before the Royal Institute of British Architects on Monday night.

"THE HOUSING OF THE DRAMA." COURT THEATRE, VIENNA.

subscribed, with the view of erecting a monument to Shakespeare. The same state of affairs also exists in our colonies, and with one or two exceptions in that other great English-speaking country, the United States.

But on the Continent what do we find? Among Latin countries in the South of Europe we certainly meet with the Private theatre to a considerable extent. We also find the Private theatre in large capitals of the Teutonic countries in Northern Europe. We further have the Private theatre, which is subsidised by the State or otherwise, notably in Paris and Northern Italy. The Private theatre, however, is not the typical home of the Drama for the Continent. Principally the Municipal theatre, the Subscription or Endowed theatre prevail, and also to a certain extent Court and National theatres, though as a rule the Governments or Courts of Europe only possess opera houses or large playhouses intended for the presentation of both opera and drama. Now the purposes of a playhouse, when not conducted as a money-making concern, as is necessarily the case with private theatres, can be (1) for the satisfaction of luxury; (2) for educational purposes; or (3) for recreative purposes, or for the realisation of any two of these intentions, or even all three.

Commencing with the Municipal theatre of the Continent, its object is generally educational and recreative, the low price of admission enabling all classes to witness the performance. Beyond the original outlay on the building, the ratepayers may either allow some annual vote towards maintenance, or they may simply guarantee to meet any deficit, should there be one. It is merely a question of a good stage management and the judicious pricing of admission, for as there are no profits to be made, the plays should practically be presented at cost price. It is not my purpose here to describe on what lines such theatres are managed, but I would impress upon you that the Municipal theatre ranks with the highest of the public institutions of any community, and the building which stands as a local monument generally embodies all that the community can afford to give in art and excellence of workmanship.

Next the Subscription theatre, which differs only from the Municipal theatre as regards origin. It is not the property of the ratepayer, but a gift presented to them, sometimes by one or more of their wealthy citizens, at other times by a large section of the community who voluntarily desire to participate in providing the city with a suitable playhouse, and who contribute from a few pence to some thousand pounds, according to their respective circumstances. It is true that such Subscription theatres are not infrequently managed by the municipality on the same lines as the Municipal theatre, the donors having presented the playhouse to the public authority, and the municipality having undertaken to administer it on the same lines as a municipal establishment. It is thus that we get the so-called "city" theatre, which, though for all practical

purposes a municipal institution, yet differs from it by the manner in which it was brought into existence. On the other hand, we have the bona-fide Subscription theatre, managed by the representatives of the subscribers, or by trustees; the municipality, however, having perhaps, also contributed to the fund in some form or other, such as by a grant of money towards the building, an annual grant towards its maintenance, or even, as is often the case, by the gift of the site. Then, again, we have the institution which is managed by the subscribers themselves, who, however, in some cases hold the actual building in trust, some rich citizen or citizens having built a playhouse, and then having handed it over to a general body of subscribers, who equip it, and undertake to manage the establishment, guaranteeing any deficit in the usual way. Lastly comes the Endowed theatre, for which land and building are presented, together with a sufficient sum put in trust to cover the maintenance of the block, and any reasonable deficit on the productions. It is the bona-fide Endowed theatre of this description that rightly ranks with some of those generous gifts of endowed picture galleries, public libraries, and artisan dwellings for which this country is distinguished.

The most recent form of the Subscription theatre, by-the-by, is the "People's" playhouse, voluntarily subscribed for by every class of the community, and conducted on co-operative lines, while a particular form of the endowed institution is the playhouse which has been provided for on philanthropic lines, for the entertainment and elevation of the working classes in the same way as many of our free libraries are established.

Now each of these—the Municipal theatre, The Subscription theatre, and the Endowed theatre—is essentially a public institution. The standard of its founders is a high one, and where this is the case it follows that the conception and rendering of both interior and exterior—in other words, the architectural lines—ought to attain an equally high standard. The Municipal theatre practically always stands as a monument to the prosperity and culture of a locality, and the Architecture of a Subscription theatre is intended to give a similar impression. A certain spirit of rivalry between different localities also effects the architectural treatment; for the Municipal or Subscription theatre generally becomes the show place of the locality, and it is not infrequently used for purposes of ceremony and hospitality. In many respects it is also the assembly room for all classes. As suitable law courts should emphasise the dignity of justice, and a Government office should indicate the centre of authority, so should the playhouse embody the social status, the culture and prosperity of the community, and this I am glad to say is generally the case on the other side of the Channel.

But let me at once say that not every Subscription or Endowed theatre, nor every Municipal theatre, is erected solely for the

presentation of the Drama, though there are many instances where this is the case, and only recently I have heard that the city of Frankfort, which already has a magnificent subscription opera house, is about to have a municipal home for the Drama as well. Not infrequently such playhouses are also intended for the presentation of opera. A playhouse may be built particularly as the home of the Drama, but it may be arranged so that opera also can be presented. The opposite is often also the case, that is to say, a municipality has its opera house in which Drama is presented, and besides the regular opera company, there is a regular dramatic company. As, however, we are speaking of the "Housing of the Drama," it is not a question of immediate importance whether the building is used for other purposes than that for which it was originally intended, or whether Drama is temporarily produced in what we might term an opera house. The only point we have to bear in mind is that one and the same building is frequently technically unsuited for the two purposes. A building intended for the presentation of the Drama, and well balanced in its proportions, becomes "dwarfed" in feeling, if I may say so, when grand opera is presented in it, whilst *vice versa*, all the beautiful effects in acting a chamber play are lost in a building designed primarily as an opera house. Now this can be the case, and is sometimes the case in the Municipal, Subscription and Endowed theatres, but as a rule, we may take it that this unsuitable combination is one of the characteristics of the National and Court playhouses. Of course, there are also National and Court playhouses identified solely either with the Drama or the opera, for Vienna has its opera house as well as its Court playhouse. The Czar's theatre administration has together seven playhouses, three of which are devoted to the Drama. Berlin has its "Schauspielhaus" as well as its opera house.

But what is a National or a Court theatre? I have said theatres originate either from a commercial object, for the gratification of luxury, for educational purposes, or for recreation. Now, the Court theatre is peculiarly the luxury of royalty, established and maintained at the expense of the reigning monarch, though generally open to the admission of the general public on a certain payment, except when reserved entirely for some Court function. The Court playhouse is generally the pride of a continental monarch. He uses the building for the entertainment of his guests, for public receptions, and the like. Whether the production be an opera, a play, or a ballet, is often quite immaterial as long as the production is of a high standard, and does credit to the culture of the Court. Being the outcome of luxury, the Court playhouse, however, frequently becomes a veritable palace of luxury, for nowhere is the play more sumptuously housed than in these Court establishments. This lavish style of housing is, however, not so much due to any desire to give the play dignified surroundings as to give the

"THE HOUSING OF THE DRAMA," MUNICIPAL THEATRE, ROSTOCK.

Court a suitable place of entertainment. Practically the same description holds good for National and Government theatres, with the exception that the institution then becomes the pride of the nation at large, and a suite of reception-rooms for the Government. The educational objects put forward by Government are, I am afraid, merely an excuse in such cases. As the Court playhouse is a symbol of the power, means, and culture of a reigning monarch, so does the Government theatre indicate the resources of the State, and the architectural pretensions of the building vary according to national influence and wealth, quite independent of any idea of suitable housing dramatic art.

Now, as I have said, the presentation of opera or drama is often combined in the Court or National buildings, many Courts and Governments having only one playhouse, whilst employing two or even more companies for the presentation of the different forms of entertainment. As I have indicated, however, this system does not lend assistance to the proper housing of the Drama, for no art requires so careful and studied an environment. The greatest attention should be given to questions of proportion, even to the extent of the designer weighing the preferences of an audience in favour of grand drama or chamber drama. The same house, which may be suitable for the presentation of a great Shakespearean play, is by no means desirable for some little character sketch with a cast of only four or five individuals. The administration of the Court Theatre at Vienna has recognised this, and, whilst at the present time it controls the most beautiful home for the Drama that exists in the world, it has yet deemed it necessary to consider the advisability of erecting another Court Theatre devoted entirely to chamber plays, leaving the grander house for the presentation of great classical plays. It is too ridiculous to find the *Comédie Française* company playing at Drury Lane, and grand opera at Daly's Theatre. Nothing could be more incongruous. I will even go farther. I will say that whilst Her Majesty's Theatre is by no means too big for the presentation of "Julius Cæsar," I should much prefer to see "The Liars" given at the "Criterion" than at the larger house in the Haymarket. Eight hundred, with a maximum of one thousand, should be the extent of an audience for a chamber play if every individual in that audience is to appreciate the acting. For "Julius Cæsar" there is no reason why the auditorium should not be capable of holding two thousand people. In the same way, I see no reason why the opera house should not hold an audience of three thousand.

(To be continued in our next issue.)

Mr. Bernard Shaw, who opened the discussion, humorously observed that his education in Architecture had been very considerably neglected. I am not, he said, in the habit of going to places where there is much Architecture. Mr. Sachs has spoken of the opera as being something which always requires a very large theatre. That is really no more true of the opera than the drama. That is to say, there are operas which require a small theatre, just as much as certain plays require a small theatre. On the other hand, there are operas which require large theatres. You may have three thousand people at an opera, yet to produce the operas of Mozart—which are admittedly the greatest ever written—in a large theatre simply murders and destroys them. In England we hardly know anything of the operas of Mozart. Then what are the

DIFFICULTIES IN THE WAY

of getting public and endowed theatres in this country? You have to consider you have a condition of public feeling in England which, as far as I know, does not exist on the Continent. The majority of the population in England do not think about these things at all; they do not believe in the theatre as a Temple of Art or a centre of learning, but condemn it as the gate of hell. That is a tremendous difficulty in your way, but when you propose to endow the theatre from rates and taxes, you would immediately get the whole body of ratepayers

against it. To give a practical illustration, I am a member of a local government board in London, and we occasionally receive deputations on various subjects. The other day a deputation came up and consisted of one person. He was a gentleman connected with a theatre, and he wanted to erect a theatre in our parish, and required the power and support of our body. We asked what we could do for him, and he then said the fact was a clergyman was opposing him. The reverend gentleman, he said, had a mission hall next door to where he was going to erect his theatre, and the clergyman had appealed to the Ecclesiastical Commissioners who owned the land upon which the theatre was to be built not to sanction the erection of a theatre on the ground. He was perfectly aware that a recommendation from the Commissioners would have very great weight. No one would dream of remonstrating with the Ecclesiastical Commissioners when they are opposed to having a theatre. I believe that is the feeling against which we should make a very strong objection. No doubt the number of people who get modern ideas from the theatres is very small in comparison to those who get them from the churches, and yet we must not forget that the former is an enormous body. Another

OBSTACLE TO THE ENDOWED THEATRE

is this: Englishmen believe in private enterprise, and that includes taking pretty good care of the theatre. The speaker proceeded to make reference to the competition between the multiplicity of suburban theatres with the great central theatres in London, remarking that the latter had charged large prices for most worthless entertainments, and the people in the suburbs were beginning to find out that they could get good entertainments cheaper and with more comfortable hours. So he believed the central theatres would be enforced to undertake higher skill and a better class of work. The only plays, he continued, for which you really want a sort of endowed theatre are unfortunately those with regard to modern manners, and upon which there is a considerable division of opinion, even amongst the people themselves. As far as Shakespeare is concerned, you will find it very hard to persuade the ordinary enterprise to take care of those plays, but when you give the plays of Ibsen and others of the Modern School, then it is you find the people want to see these again. I am rather afraid, though, that if you go to the London County Council and ask them to supply a theatre for a particular kind of play, you will find some difficulty about it. In conclusion, Mr. Shaw expressed his warm sympathy with Mr. Sachs's paper, and provoked amusement by drawing the attention of architects to the condition of the crossings in London as he had seen them when leaving the theatre.—Mr. William Archer, who had also been invited to take part in the discussion, said we suffer a great deal from the general

ESTIMATION OF THE THEATRICAL ART

in England—that most theatres are disguised gin palaces, or, at any rate, if not disguised as such, then they are sandwiched between two gin palaces. The effect of an architectural rendering of a building which would give people the sense of going to an entertainment which is, I will not say solemn—that is rather too strong a word—not entirely and merely a pastime, would, I have very little doubt, raise the instinctive idea that people have formed of the Drama. I think the manager who wanted a vestibule which would make people cross themselves was not entirely wrong. A Subscription and an Endowed theatre, I should say, are practically the same thing. I agree that we might put aside the city or municipal place of entertainment. I think it is outside practical politics. It is easy to say, Why not have endowed theatres if endowed picture galleries and museums? The reason is plain. A picture gallery and a museum exist and do not require management, "or to be carried on."

A PICTURE GALLERY OR MUSEUM is built, and people go there, or do not go, and it simply exists. But a theatre has to be

managed. Of course, we have the old plays of Shakespeare, Sheridan, and Goldsmith, &c., but no theatre can subsist entirely upon these. If the theatre supplies thoroughly good plays, the outcome of the life of the day, represented by living men, and does not represent living literature, then the theatre is a monument; but if it is not a living institution, I do not think it is worthy of support. Commenting upon the different kind of plays, Mr. Archer took exception to Mr. Shaw's recommendation of Ibsen. We have, he said, all the Ibsen we want. Any national or endowed theatre that made Ibsen the plank in its platform would be giving away its case entirely. I think the idea Mr. Sachs has mooted is in the air, not only in Manchester, but throughout England. I think Mr. Sachs has largely contributed to qualify our views upon the point by the plans of monumental work here. He has shown us that the theatre can be and ought to be a beautiful and worthy building. I cannot help thinking that a greater realisation of what can be done in theatre construction has been brought home to us, and the absolute meanness and

DESPICABLE APPEARANCE OF THE LONDON THEATRE

Architecture, as it at present exists, must kindle the spirit of patriotic enthusiasm in anyone studying Architecture. The great difficulty in London is that we have no local patriotism. London is too big for it, and that is why I think we shall have one such theatre in the provinces before London. But if we have not local patriotism in London we might have Imperial patriotism, and after all it would be a worthy theatre in London to represent that; it would be a political instrument of no small importance, the rallying point for the English-speaking world, but we do not quite realise it. I cannot help thinking that some one of the millionaires of whom we hear so much has here an unique opportunity for founding for himself a monument. I am quite sure that whether such a theatre is the result of subscription or the munificence of a single man, it is looming ahead.—Mr. Alfred Darbyshire, of Manchester, expressed his entire acquiescence with Mr. Sachs. In the matter of theatrical Architecture, he said, we English people are greatly behind the Continent. We have not produced in England a single architectural triumph in theatrical Architecture, so far as I know; and I have arrived at the conclusion that, under present conditions—that is, under private enterprise and speculation—we never shall reach the height of the lovely things we see abroad. It is very sad, but it is very true. When an architect has to design a theatrical façade on a site hemmed in with other buildings, he can do nothing, and, therefore, as long as our

PRESENT CONDITIONS

obtain, we shall never have a chance of producing anything worthy of what we see abroad. Mr. Darbyshire concluded with a tribute to the memory of Mr. Phipps, who, he said, had done the best that could possibly be done under existing conditions when he designed Her Majesty's Theatre in the Haymarket. Mr. Cecil Raleigh assumed the role of comedian in the discussion. After a humorous preface, he asked: What does it matter what a theatre is like outside?—If you are walking along some thoroughfare, and you see a perfect dream in the exterior of a theatre, you remark "Is it not lovely?" "Yes, but have you seen the play inside?" That is the point. It really does not matter what the outside of a theatre is like. The perfect theatre is the house where a play can be produced to the greatest advantage, and if the outside consists only of four square brick walls, it really does not matter a cent. A vote of thanks to the lecturer concluded the discussion.

At the meeting of the R.I.B.A., on Monday, the Chairman (Mr. H. L. Florence) announced that the Council had decided to recommend to Her Majesty the Queen the name of the President (Professor Aitchison, R.A.) for this year's Royal Gold Medal.

THE

Institute Prize Competitions.

CONSIDERING that the Soane Medallion is not awarded this year, with which decision everyone must agree, it might, perhaps, be more useful to make some remarks about the site given for this subject, rather than the designs submitted.

The subject is a concert hall to seat 3000 people. The site is a rectangle at the corner of two streets, with 100ft. frontage and 160ft. depth, with no right of light on the left hand side or the rear. This is as good a site as is likely to be provided for such a building in London; but then, in London, these matters are not understood. In any other capital city, or even in any second rate French or German town, an isolated site would be considered necessary, and, if possible, would be provided for a building of this character and importance. It is surely not exactly in accordance with the dignity of Architecture, that the Institute should take its ideas for the treatment of public buildings from the Corporation or the L.C.C. Its attitude should rather be one of protest against the prevailing mismanagement. It should steadfastly hold up

create monstrosities when we are obliged to do it by the force of circumstances.

It is not that this particular site is a particularly bad one; on the contrary, it is relatively good. The Academy last year, for instance, gave a site for the very same class of building which was even ten times worse; but there is no reason why it should not have been better, even perfect—there is nothing to pay for it. You cannot get a perfect building without a perfect site to stand it on; as far as this site falls short of perfection, so far has the Institute deliberately insured that the designs shall fall short also. Worse sites are often seen; but a protest can be entered against this as well as against a worse, for the principle of the thing is wrong.

The Tite prize this year attracts the greater number of students, perhaps because the Soane is made rather difficult. The subject is, "A Villa and Ornamental Garden in England in the Italian Style," with "a riverside area of two acres, not necessarily level." The competitors may have been in some doubt as to the exact meaning of this title, and the construction to be placed on the words "in England." It suggests neither one thing nor the other. If a villa is in the Italian style, it is, and therefore is, in the nature of things, unfitted for English climate and requirements.

and occasional heavy snowstorms. The top-lighted w.c. in the centre of the building attached to the billiard-room may be Italian, but it certainly is not in accordance with English ideas of sanitation. It looks as if this could have been so easily avoided by placing this lavatory on the other side of the billiard-room, where it would have been against the outer wall. The space it now occupies, forming a sort of arcade in the conservatory, would have been an improvement to that room, and would have made a better suite of the three rooms.

The summer houses, terraces, &c., in the garden are not very Italian, and perhaps the steps and different levels are not particularly well arranged.

In fact, in most of the designs the laying out of the gardens is the weaker part; but considering how little this subject is studied in this country, this is not to be wondered at. It seems a pity that a section, right through the grounds from back to front, was not asked for, it would have explained the levels and the general setting out of the schemes so much better.

A medal of merit goes to Mr. Thomas A. Pole for a design which is more English perhaps in character. The house is spread out over more ground, and is roofed in a way that suits this climate better.

SECTION THROUGH DRAWING ROOM, HALL, DINING ROOM & CONSERVATORY.

an ideal standard. In no way can it help more effectually in securing better arrangements in the future, than by impressing on the rising generation a true conception of what a public building is and of how it should be treated.

A concert hall is for the public use, and is a public monument which should be a complete and independent work of Art, expressing its character in its general setting out. Complete unity of conception and artistic expression, is impossible where the building is jammed against others on two sides.

To gratuitously provide a site like this, on which no building, which entirely covered it, could be anything but a cripple, is to insure failure from the start, and it tends to give the students the idea that this site is all that can be desired. It lowers their ideas of what such a building should be like, and it has the serious effect of weakening and disarming all protests against public mismanagement in the choice of sites for public buildings, for with what heart can we protest while the public can plead the example of the Institute itself, which it considers to be our representative Society. To choose deformed sites for these students' competitions—because they are the sort of thing they will eventually have to deal with in practice—is no better than to insist on the students of sculpture designing cripples, and studying badly-proportioned models, because they will eventually have to erect monuments to battered soldiers and sailors and overfed aldermen. It is time enough to

If alterations are made to suit these—which the inclusion of the words "in England" suggests—the peculiar characteristics of an Italian villa are necessarily destroyed, the building is no longer in the Italian style; for it is just these characteristic arrangements that give it its style, not simply the use of Renaissance columns and mouldings; so that it seems difficult to know how to carry out the programme, and, at the same time, to produce Architecture. To design an Italian villa is a study of great value to the architect, but to distort it to suit other than its natural requirements is to destroy its peculiar charm, and the exercise of this particular form of ingenuity is no help to the student, and its result is—with all respect—not Architecture. From the wording of the programme this is what the student is expected to do, and this is more or less what has been done by all.

The prize has been awarded to Mr. John Stevens Lee for a design, which—taking it as we find it—emphatically deserves this honour. It certainly possesses undoubted merit. The plan is simple and well constructed, and the building is treated with a simplicity and reticence that is distinctly pleasing. But, at the same time, there are arrangements introduced which are suited neither to English climate nor ideas. The central hall is top-lighted at the first floor level; this gives a flat with skylights at the bottom of a central area or well. To drain nearly half the roof area into the centre of the building is good in no country, least of all in England, with its continual rain

Of the remainder, that by "Tiber" strikes one as the best; the plan is straightforward, the elevations are simple and rather pleasing, though they are hardly Italian in character, and are spoilt by the two pavilions on the roof, which do not look well, and which stand on nothing.

The subject for the Grissell gold medal is a small country church, to seat 200 people, constructed entirely of wood. As this prize is given "for the encouragement of the study of construction," it seems a pity that so many of the competitors should have devoted so much time to the production of "artistic" drawings, for it is noticeable that the more "artistic" the drawings, the less has the construction been explained. Several competitors have wasted much time in evolving strange hieroglyphs in the corners of their drawings by way of titles. Is this part of the "artistry"? They are certainly most illegible, if this is any proof of Art, and many of them are passing ugly, which is a convincing proof. The medal has been awarded to Mr. Harbottle Reed, and a medal of merit to Mr. W. Stanley Bates. It is impossible, without going carefully into the calculations, to appreciate all the points for and against these designs; but what strikes one at the first glance is that both these designers introduce wood buttresses like embryonic shores or needles. Is not this rather opposed to the first principles of timber construction? Does not the essence of good artistic construction consist in making use and taking advantage

ELEVATION TO TERRACE

Reproduced from a tracing.

of the peculiar nature of the material, to obtain effects characteristic of that material? Is it not a characteristic property of wood, as distinct from stone, that it is capable of tension? so lending itself naturally to a system of ties. Should not a wood roof truss be framed up in such a way as to throw no thrust on the wall? Would it not be more characteristic of the material? The buttress is a characteristic feature of the stone vault, not of the wooden roof. There is, unfortunately, precedent for the construction of wooden roofs which, not being properly framed up, need buttresses, such as the roof of Westminster Hall; but this sort of roof is not characteristic of timber construction, and there is no obligation to follow a bad precedent. Where the weight of the whole roof is brought down to a few points by the trusses, it is natural, perhaps, to strengthen these points of support; but it should not be done in such a way—the support should not be given such a form—as to suggest a thrust, which, if the roof is properly framed, does not exist.

A. R. J.

A NEW gaol is being erected at Sierra Leone at a cost of £20,000. Waterworks are also to be constructed, and will cost the colony about £30,000.

An enquiry has been held at Falmouth concerning the application of the Corporation for sanction to borrow nearly £4000 for the purpose of street improvements.

THE foundation stone has been laid of an infectious diseases isolation hospital at Sealand which is to be erected at a cost of £14,400. Mr. H. Berwick is the architect, and Mr. W. W. Freeman the contractor.

ALNWICK CASTLE, according to a learned antiquary, owes its origin to the Romans. It is one of the largest Gothic buildings in Britain, containing about five acres of ground within its outer walls, flanked with sixteen towers and turrets.

A UNIONIST CLUB has been opened at Salt-coats. The building is situated in Nineyards Street, and is of two stories, containing commodious reading room and committee rooms on the ground floor, and a billiard room and caretaker's apartments on the first floor.

AN important improvement is being carried out on the front at Clacton-on-Sea, which will add very much to the attractiveness of the town. The scheme includes the construction of a spacious marine promenade, the extension of the much-favoured garden terrace along the cliff, and the erection of commodious and comfortable shelters.

THE Skipton Board of Guardians has decided to adopt provisionally a plan of a new infirmary, based on the design carried out in the Knaresborough Union Infirmary, and has instructed the architect (Mr. J. Hartley, Skipton) to wait upon Mr. Gordon Smith, the Local Government Board's architect, and ascertain what, if any, modifications were necessary.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

February 9th, 1828.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

WE have pleasure in calling our readers' attention this week to the publication of the first number of SPECIFICATION. For a period of twelve months the editorial and managerial staffs have been engaged upon the careful and painstaking production of what the Proprietors hope will prove to be the leading technical authority in matters of construction wherever the British system of building is in vogue.

OWING to the growth of material for the work, and the laborious nature of verification, the Editors have to acknowledge some delay in the issuing of SPECIFICATION; but the delay has had the advantage of enabling the scheme to be the more perfected, and they see the completion of the first number feeling confident of its appeal to architects, surveyors, and engineers when specifying, and, in fact, to all interested or engaged in building matters. The Proprietors desire to place on record their acknowledgment of the exertions of the Editor-in-chief and of the various Sectional Editors of the thirty-seven sections of which SPECIFICATION is composed.

THE Edinburgh District Lunacy Board has invited Scottish architects to submit competitive designs in connection with the establishment of a lunatic asylum which it is proposed to build on the estate of West Bangour, in the parish of Ecclesmachan, Linlithgowshire, about two miles west of Uphall. It is intended,

in the meantime, that accommodation will be provided for 600 patients, though suitable provision will be made for extensions whereby 1000 will be accommodated. Only architects in Scotland who have been in practice on their own account for not less than two years will be permitted to compete. The architect selected by the Board will be employed to carry out the work at the rates of remuneration, and under the conditions contained in the schedule, sanctioned by the Royal Institute of British Architects. If from any cause the buildings are not proceeded with, and no drawings other than the competitive drawings have been prepared, the selected architect shall receive a payment of £500 in full of all claims. In respect of the other competitive designs, four premiums will be paid in the following order: £250 to the author of the design adjudged to be best by the architectural assessor; £200 to the author of the design placed second; £150 to the author of the design placed third; and £100 to the author of the design placed fourth. The Board desire that the buildings should be of the most substantial description, and pleasing in character, but they do not desire that any considerable expense should be incurred on mere ornamentation.

No visitor to Athens but will be glad to know that the date of the erection of the fine little Ionic temple of the Wingless Victory, on the right hand of the entrance to the Acropolis, is now approximately fixed. The date, to be accurate, of its first erection; for it was reconstructed in 1835 out of its ruins by the architect Laurent. Recently, in the excavations on the north-west face of the Acropolis, an inscription has been found mentioning a sanctuary, for which a new door was to be provided, and in which a temple and altar were to be built by Callicrates. That architect, we already know, helped to build the Parthenon. The new temple mentioned can be no other than that of the Wingless Victory. The lettering of the inscription shows that the building must have been begun about the middle of the fifth century; and it is practically certain that, architecturally speaking, it was completed before the Propylæa in 432 B.C. Thus we have the architect and the date of this charming temple. Who carved the splendid reliefs of the balustrade? They seem to be rather later, and it is quite open to us to suppose that they were a subsequent addition.

THE building of the new War Office on the site of Carrington House, opposite the Horse

Guards, is to be commenced immediately. Powers were obtained last Session for acquiring the land and the buildings thereon, and within a week or two the Office of Works will begin to pull down. Among the buildings to be demolished are the old United Service Institution, the offices of the Board of Works itself, and some quaint old buildings in Middle Scotland Yard, now occupied by solicitors and architects. An important departure will probably be taken when the time comes to select a design for the new buildings. The equivocal success obtained by putting the designs up to competition in the case of the Royal Courts of Justice and the new Admiralty buildings has made it probable that the British Institute of Architects will be invited to nominate several names, out of which one will be chosen to make a design in accordance with the requirements of the department.

A SPECIAL commercial section has now been added to the British Fire Prevention Committee, obvious reasons having made it impossible for trade interests to be directly represented on the professional body. The section has been inaugurated, not only with a view of bringing together those commercially interested in the various inventions, systems and appliances which are to have the consideration of the committee, but also with the view of having the assistance and advice of the trade, as to independent fire tests—such as are advocated by Professor Aitchison, R.A., President R.I.B.A. (one of the original members)—and similar important matters. The section will be presided over by an architect or an engineer of standing elected from outside, and he alone will represent the co-operate opinion of the section on the committee; individual preferences will thus be avoided, and the independent position of the section retained. This organisation of the section was the result of protracted consultations between the managers of the leading London firms, and Mr. E. O. Sachs for the executive. Among the firms already represented on the section, the following are primarily interested in questions of materials and constructions:—The Adamant Co. (Birmingham), the Asbestos Co., Bell's Fire-resisting Doors Co., Braby and Co., British Thomson Houston Co., Dawney and Co., Dowson, Taylor, and Co., Edison and Swan Co., Elder and Co. (Glasgow), Ewart and Sons, Expanded Metal Co., Fawcett and Co., General Electric Co., Homan and Rogers, Hydraulic Engineering Co. (Chester), Jones and Co., Lindsay and Co., Owen Stone Co., Potter and Co., Pulham and Son, Pilkington Brothers, Rashleigh, Phipps and Co., Robinson and Co., Strode and Co., Stuarts Granolithic Co., United Kingdom Terra Cotta Co., and Patent Victoria Stone Co.

THE following minute relative to the services of Dr. Rowand Anderson, architect of Edinburgh University New Buildings, including the M'Ewan Hall, prepared by a Committee of Senatus appointed for the purpose, has just been presented to the Senatus:—"On the occasion of their first meeting subsequent to the opening of the M'Ewan Hall, the Senatus Academicus unanimously resolved to place upon record their sense of the value to the University of the services rendered by Dr. Rowand Anderson during a long period of years as architect of the University New Buildings. So far as the structures for academic use are concerned, these buildings may be considered as completed by the M'Ewan Hall, and the occasion thus afforded of looking back over the time elapsed since the first inception of the scheme brings to mind the constant care and thoughtfulness which Dr. Rowand Anderson has shown in providing for the many wants, often of a special kind, of the medical departments. The Senatus recognise, at the same time, the hand of an artist in the architectural treatment of the buildings. While considerations of convenience have not been sacrificed to appearance, the planning of the interior arrangements has resulted in that effective external grouping which has made the New Medical School, as a whole, an acknowledged adornment to a city famous for its architectural monuments. In a building like

the M'Ewan Hall, designed for University ceremonials, Dr. Rowand Anderson had an opportunity of disposing in greater freedom of his means of artistic expression, and the simple dignity of the main effect, both from an exterior and an interior view, together with the taste and reserve shown in the use of carved ornament, represent fittingly this side of academic life. The name of the University will now be connected with one of the conspicuous architectural achievements of the closing years of the century, and the Senatus Academicus recognise that the merits of the design of the Hall entitle the architect to the lasting gratitude of the University."

THE Gloucester Journal states: "We understand that Mr. Robson, the architect, who prepared plans and got out quantities for the abandoned scheme for transforming the Winter Garden into a Kursaal and Municipal Offices, has sent in his account, which amounts to upwards of £3408. We believe it was stated that the preparation of plans did not commit the Council to anything. The ratepayers may perhaps express an adverse opinion if the above figures—which have yet to come before the Town Council—prove to be correct."

BUILDING is now in rapid progress at Greenwich Observatory, and when "Visitation Day" comes round again next June, it is probable that the new edifice, in its completed form, will be open to the inspection of the guests. Last June only the central portion of the new observatory was completed, and there remained to be added the east and west wings now in course of erection. The curious, irregular old buildings which formerly constituted Greenwich Observatory have lost their dignity, and this new structure has assumed the honours of the place, though it has not the distinction of being on the meridian of Greenwich. That, of course, remains where it was, and still runs through the queer old building in which the transit circle is housed. This new edifice, when complete, promises to be strikingly handsome, and with the slopes about its base entirely reformed and re-embellished, will present an appearance somewhat worthy of its world-wide reputation.

BERKELEY STREET is at last being utilised as a residential portion of Mayfair, and the old stabling is fast disappearing. Ashburnham House is nearly down, and the fine residence, with stone frontage, which is being built next to the Bath Club, is now out of the builder's hands. All the front windows overlook the garden of Devonshire House, and the ground floor is raised some feet above the level of the roadway. The magnificent carved mahogany doors, which were so much admired at Ashburnham House, were bought by the owner, and are now in position in their new quarters.

At a recent meeting of the Metropolitan Railway Company the chairman remarked that an improvement in the ventilation of the railway would benefit both the shareholders and the public. As to the use of electricity, the directors for years past had had the subject on the brain. They thought they were now on the way to secure it, but there were great difficulties in the way. Replying to enquiries, he said the whole question of ventilation had been threshed out by the Departmental Committee. Electricity was the solution of the problem. They would require entirely new stock. There was no difficulty about pulling trains of 200, 250, or 300 tons. The question to be solved was having a sufficient reserve of energy on the circle in the event of two, three, four, or more trains wanting to start at the same time, for them to do so. That was the problem exciting the minds of the electricians.

A GOOD deal of interest has been manifested at Cardiff in connection with the extensive excavations that are now taking place in the well-treed knoll that forms the north-eastern extremity of the castle walls. In time past a good deal of controversy has taken place as to the Roman origin of the castle. Writing in his celebrated work upon mediæval military Architecture in 1884, Mr. George Clark expresses his opinion that the castle is of Roman origin, but says that his "opinion is but moderately supported by scanty discoveries of Roman remains." He says "The position of Cardiff Castle, having a river front and rear, and the sea close upon the southern flank, is such as would be selected by a commander skilled in the art of war and enclosed in an enemy's country, and such as with disciplined troops would be impregnable. These conditions, the name of the place and its position upon the well-known *via maritima*, are suggestive of a Roman origin, an opinion indeed but moderately supported by scanty discoveries of Roman remains, but in unison with the form and character of a part of the earthworks which enters into the composition of the present castle. There appears to have been a single lofty bank raised from an exterior ditch, and enclosing much of three sides of a quadrangular space, a practice by no means unusual in Roman or 'quasi' Roman encampments. The banks are about 30ft. high, 90ft. broad at the base, and 12ft. at the summit, along which runs a light embattled wall about 6ft. high and 2ft. thick. At the south-east, north-east, and north-west angles the banks are strengthened, possibly to carry towers, of which, however, no foundations have been discovered."

THE recent discoveries have done much to prove the correctness of Mr. Clark's theory concerning the origin of the castle as a whole, and the supposition that at the north-eastern extremity a tower once existed. An examina-

tion of the excavation, as at present made, shows that at the left-hand side of the mass of masonry now laid bare may be seen portions of the old ashlar facing of the tower. The mass of rubble behind this clearly displays the method of building resorted to by the Romans in erecting walls of great thickness and strength. It was their custom to set layers of stone as facings on the outer and inner sides of the wall, and then in the wide space intervening to heap in rubble, the spaces between the large stones put in being filled by pouring in a species of mortar or cement. There can be small if any doubt that it was originally a Roman camp with rude stone walls to the north, east, and south. Then came the Saxon invaders. It was their custom to build mounds, and doubtless the high mound that was thrown up both inside and out over the top of the old Roman wall was their handiwork. On the top of this they probably erected wooden barriers. In the midst of the protected space they threw up another huge mound called a "burh" or "tump," and on this mound was the residence of the thegn.

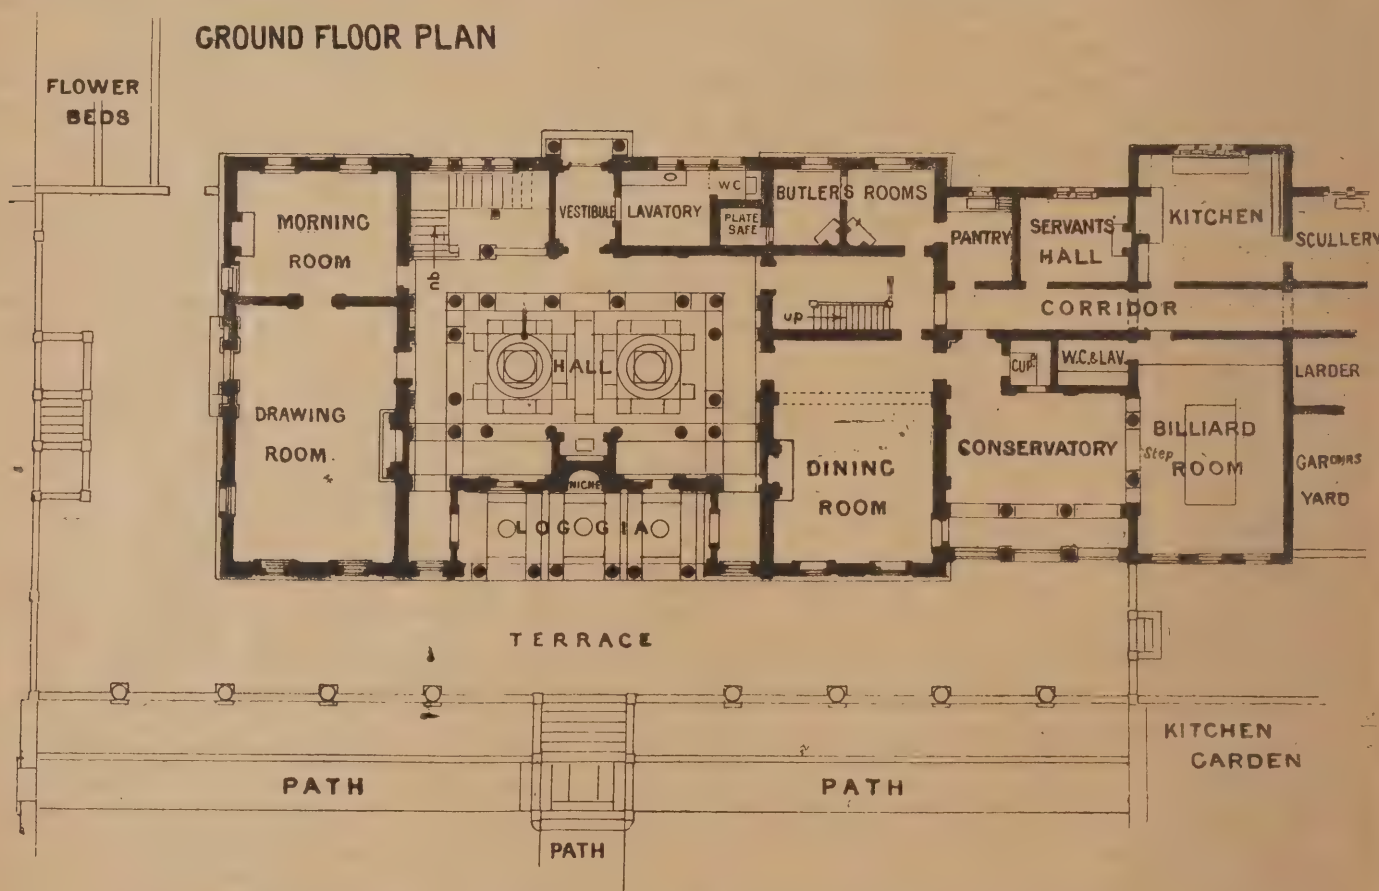

Energy," a naked figure, in the early glory of manhood, reigning in and controlling a fiery steed of classical type, while he—this ideal personification of "Beneficent Force"—looks steadfastly and fearlessly ahead, shading his eyes with one hand from the sun, and seeking—as we are told in a description obtained, no doubt, from the sculptor himself—for "new labours and fresh conquests." Horse and rider, as a group, are manifestly inspired by those incomparable figures of young horsemen riding in the Panathenaic Procession, as we see them in the Parthenon frieze at the British Museum. The conception is none the less Mr. Watts's own, since he has known how to infuse into it his own lofty personality, his own human sympathy and modernity of feeling, giving new life to formulas of art consecrated by the past.

At present the gigantic equestrian group, like many of this artist's loftiest conceptions on canvas, is an aspiring and noble effect rather than a complete work of art in which all technical difficulties have been overcome. If only Mr. Watts's hand could have expressed to

only in material, but in outline, and mass. In France it is the rule that, when a monument or statue of importance is to be set up in the open air, the collaboration of an architect with the sculptor is secured. If this rule had been more generally followed over here, we might have been spared many monstrosities which now disfigure the open places of London.

MR. F. J. HORNIMAN, M.P., is erecting a new museum in the place of the old "Horniman Free Museum" at Forest Hill. The treasures in the present museum will be placed in the new one, together with others, and there are to be pleasure grounds, recreation hall, and other buildings. It is hoped that the new Free Horniman Museum will be opened to the public in the summer of 1899.

It is reported that Government Japanese engineers are preparing plans for the construction of a bridge across the Straits of Shimonoseki, so as to unite the main line of the Kin Sun railway with that of the Sanyo line from Shimonoseki to Hiogo. The straits

AT THE R.I.B.A. DESIGN FOR A VILLA. THE TITE PRIZE DRAWINGS. BY JOHN S. LEE.

Reproduced from a tracing.

But then came the day when the Norman landed. He crowned the tump with a keep, which to-day, in ivy-clad old age, tells us by its architectural style that it was of Norman construction. The Normans must have pulled down the old wooden barriers that the Saxon had placed along the top of the earthworks which covered the original walls, for they supplanted them by a slight stone wall with a foundation only 2ft. in depth into the top of the mound.

COMPLETING his important gifts of paintings to the National Portrait Gallery and the National Gallery of British Art, Mr. G. F. Watts has presented to the nation his colossal equestrian statue, "Energy," or "Force," upon the model of which he has been working for many years past. This constitutes, with the equestrian statue, "Hugh Lupus," done for the Duke of Westminster, and now in the grounds of Eaton Hall, the veteran master's most important contribution to the art of sculpture. The statue represents "Physical

the utmost all that his brain and heart had conceived, we should have had in him the greatest master of this century. No doubt, however, many of the roughnesses and peculiarities of modelling which disturb the eye in the model will be removed before "Physical Energy" is cast. Much, too, can be done towards securing technical perfection by carefully retouching the group after it has been cast. The site chosen to display it is a magnificent one, in the centre of the terrace at the foot of the Serpentine. So magnificent is it, indeed, that it behoves the master and his assistants to see that the work, as realised once for all in imperishable bronze, lacks no pains that might impart to it a higher technical perfection, that might give added finish and beauty of form to a conception so worthy already of the loftiest and truest idealism among our British artists of to-day. Much will depend, too, upon the design and proportions of the pedestal upon which "Physical Energy" is to be placed. This should be simplicity itself, and yet fine, not

at the point referred to, are about one mile in width, and the current through them is very rapid. The bridge must be constructed sufficiently high to enable the largest ocean steamers to pass beneath. It is said that the undertaking, if carried out, will be one of the greatest engineering feats of its kind in the world. It is intended that the work of construction will be undertaken and superintended by Japanese engineers exclusively.

THE Finedon Memorial Tower is perhaps one of the quaintest dwelling houses yet devised. The tower was built a number of years ago in memory of the son of the Squire of Finedon. Curiously enough, the tower was built without mortar, the stones being laid in such a way that one stone binds another. But it was not considered safe, and to prevent the collapse of the tower buildings at the foot were added the whole now being used as a place of residence. Finedon Tower is believed to be the only memorial tower in the United Kingdom that is used as a dwelling house.

FEBRUARY 9TH, 1898.

A NEW METHOD OF SHORING BUILDINGS.*

BY CHAS. GEOGHEGAN.

IN the year 1859 the directors of the Royal Bank, Dublin, invited four architects to compete for comprehensive alterations to their premises in Foster Place, giving the competitors full permission to utilise any portion of the buildings then in their possession, extending from Foster Place to the rear of the houses on the east side of Anglesea Street, in order to secure the most commodious cash office possible; but without interruption to the bank officials or to the occupants of the two upper floors and basement of that portion of the premises situate in immediate connection with the old cash office.

When informed that the directors were disposed to adopt my plan as being most suitable to their requirements, I learned that this conclusion had been come to with the expression of their opinion that it would not be possible to demolish all the portions of the old work, as shown by my plans, and shore up the superstructure without causing the destruction of the entire front premises, and their fears had been confirmed on submitting the project to the inspection of an architect of high position and great experience.

To this communication I replied that I was willing to undertake the work, with all its risk, and felt perfectly confident that all difficulty would be overcome, and that by the use of iron frames in place of timber needles and supports the work could be carried out with much greater safety and less expense. But the great difficulty of finding an enterprising, practical firm disposed to embark in so novel a project almost deterred me from proceeding in the matter. But having laid all the details of the proposed scheme before Mr. W. Anderson, who was then acting as engineer to the firm of Messrs. Courtney, Stephens and Co., I received from him every encouragement, and he kindly volunteered to undertake the entire preparation of all details connected with the shoring and placing the beams *in situ*—a work which required more than ordinary ingenuity and skill to complete, and one which I would have feared to incur had I not been so fortunate as to have had his sound professional advice and experience to reassure me. You will no doubt be glad to hear that my former Mentor is now better known in London as Dr. William Anderson, C.B., D.C.L., Director General of Ordnance Factories. He will be pleased to learn that his name is not forgotten in Dublin, where he first had many opportunities of exhibiting his great intellectual powers.

Exclusive of the danger and unsightliness of settlements, almost sure to result if it were attempted to support masses so rigid and friable as brick walls on elastic pillars of wood, 40ft. high, there was the objection that to get the shores put up the whole of the ground and first floors would have to be removed, and the walls thereby deprived of valuable lateral

support, when they were likely to be unduly strained by unavoidably unequal shoring. The expense also of providing suitable foundations for the shores, increased by the difficulty of getting such long and heavy timber into its place would have been very great. As three of the main beams (A, C, D, Fig. 1) were to be

the shoring frames. Exclusive of bolts, the frame is composed of four pieces—viz., the top and bottom, which act the part of short beams, and the two sides intended to carry the load as pillars. These may be of variable dimensions to suit the depth of beam and thickness of walls or load

"A NEW METHOD OF SHORING BUILDINGS."

in the same level, rigidly connected by means of bolts and nuts, it was very desirable for facility of manipulation to have them all loose in the walls at the same time. Had the system of timber shores been adopted, to attempt this would have been very hazardous, if not impossible, as the multitude of supports would have rendered the lifting and placing of the beams very intricate. To overcome these objections, I proposed to make the lower portions of the walls serve as temporary pillars to support the upper parts, by interposing frames of iron or wood, through which the beams could be passed, and accordingly explained my views to the engineer, and entrusted him with the construction of

to be supported. They are fitted together to make a truly rectangular frame, and held in position by means of bolts. The top and bottom are made cellular, with the outer walls thinner than the inner ones, in order to approximate, as much as possible, to the form of greatest strength. The vertical pieces are composed of plates, stiffened by deep ribs, to obtain rigidity with lightness, and are provided with holes near the bottom, through which a rod may be passed to carry a metal roller for the beam to run on when being pushed into its place. As the frames had to be put up in inconvenient places, it was a great object to keep the several parts as light as possible, in order that three or four men

* A paper, entitled "Method of Shoring by means of iron frames, adopted when building the New Royal Bank, Foster Place, Dublin," read before the Architectural Association of Ireland.

Fig 2

"A NEW METHOD OF SHORING BUILDINGS."

might move them with ease, without having recourse to tackle. There are two principal conditions under which beams may require to be placed under walls:

First—There may be room enough to admit the beam being launched into its place end on.

Second—The wall may be so situated that the beam can only be put in sideways, or there may be a combination of the two cases, where there may be room to launch the beam half way, provided the previous half can be got in sideways. The one case requires a different form of frame from the other, as will now be explained. Beam D (Fig. 1), supporting two heavy chimney stacks, is an illustration of the first case. There being plenty of room in the courtyard to lift the beam to its proper level, clear of all the houses, the following preparations were made:—Two holes were broken through each of the two chimney-stacks, and a good bed having been formed in each at the proper level, four frames were placed in them, and one smaller one was similarly introduced into the intermediate walls. When all the frames had been carefully arranged in line, folding wedges of good dry oak were driven between the tops of the frame and the superincumbent walls, till the weight of the latter was made to rest entirely upon the frames. The portion of the wall and chimney-stacks between the frames was then removed, and the beam, having been hoisted on tall shearlegs in the courtyard to the proper level, was launched safely into its place through the frames.

Beam A (Fig. 1), supporting the back wall, affords an example of the second case. The quoin of the adjoining house would not allow the beam to be hoisted sufficiently far back to pass it through frames similar to those used with beam D, it was therefore hoisted diagonally alongside the wall till its end entered a doorway in the bow projection, which allowed it to go far enough forward to clear the quoin, when raised to a level and placed at the proper height parallel to its permanent position, and in which it was temporarily secured. Two frames (Fig. 2) made to project their own width on one side of the wall, were inserted into holes which had previously been cut in the brickwork, and bolted together so as to include the beam within themselves. The weight of the walls was transferred to the frames, and the masonry between them cut away as before, and the beam moved in—first sideways till fairly under the wall, and then launched forward through two more frames into its permanent position.

Beam C (Fig. 1) was got into the house with great difficulty on account of its length, and was laid on the ground floor alongside the wall it was intended to support, and raised thence to its proper height, where it was temporarily held, while four frames were put round it, and secured in the walls as already described. The intermediate masonry having been cut away, the beam was moved sideways into its place under the wall. At this stage of the proceedings, the three main walls, being completely cut through, were supported only on thirteen frames, in which the beams were lying loose; the latter were carefully fitted to each other and firmly secured by means of bolts and rivets, after which the whole mass of wrought iron—weighing $13\frac{1}{2}$ tons—was adjusted to its exact position vertically and horizontally. Chases were now cut in the lower walls to admit the columns, which, having been erected, the weight of the walls on the frames was transferred to the beams by driving folding wedges between the top pieces of the former, and the upper flange of the latter, to cause the beams to deflect to their full extent previous to underpinning between the frames in brick and cement. When all was ready, the wedges over the frames were cautiously slackened, and the entire weight of the building allowed to come upon the beams and columns. The frames were retained in position for a few days, during which time the behaviour of the columns and foundations was carefully watched; and, as no signs of yielding was detected, the frames were released, the bolts connecting their several parts were withdrawn, they themselves removed in pieces, and the gaps occupied by their upper portions made good in brick and cement. The actual cost of successfully shoring up the eight walls in the manner described was £62. The builders' estimates for the same operation, without any allowance for the great risk run, was from £168 to £180—being a saving of at least £106—in favour of frame system, not counting the gain in time, security, and convenience. The urgent necessity of completing the work as quickly as possible induced the builder to use more frames than were absolutely necessary. Had there been no occasion to shore so many walls simultaneously, the work could have been done for £42, or one fourth the lowest estimate quoted above.

The entire weight of walls, flooring, roofs, &c., amounted to 200 tons, which had to be sustained on No. 13 iron-framed girders, all bedded on the same level—28ft. above the ground floor of the old and present bank in

Foster Place—the longest girder being $4\frac{1}{2}$ tons in weight and 40ft. in length, to which the shorter girders were secured by bolts with nuts and screws.

The larger metal frames cost £3 10s., and the smaller ones £2 10s. each.

In works of less magnitude than those now referred to, the system can be carried out in timber with economy and safety, and I was informed by the late Mr. Michael Meade that he had found it on several occasions the means of saving time and expense with perfect security.

The columns, which were of the unusual length of 26ft., and only 12in. diameter, required extreme care, especially as regarded the precautions adopted to ensure a uniform thickness of metal. The whole of the iron-work had been designed by the engineer, and executed by Messrs. Courtney, Stephens and Co., of Dublin, and tested by them, and great praise was given to Messrs. Crowe and Sons, the contractors, for the work, to whose zeal the success of the operations was in a great measure due.

Surveying and Sanitary Notes.

THE Burgh Commissioners of Bo'ness have accepted the offer of Mr. Thomas Peattie, contractor, to construct a large new reservoir on the estate of Lochcote, situated between Linlithgow and Bathgate. The contract amounts to £11,500. The reservoir will cover about 45 acres of ground, and hold two hundred million gallons of water. Altogether the new works will cost nearly £25,000.

THE Main Drainage Committee of the London County Council reports that during the year ended December 31 last, 46,494 and 33,373 million gallons of crude sewage were treated at the Barking and Crossness outfall works respectively, together making a total quantity of 79,867 million gallons, or an average of nearly 219 million gallons per day. During the same period 1,408,000 and 697,000 tons of sludge were sent to sea from the respective stations.

At a special meeting of the Douglas Town Council the report of Messrs. Stevenson and Burstall, engineers, the authors of the improved scheme of drainage for Douglas adopted by the Council, was considered. Mr. Stevenson explained the causes that had resulted in his original estimate of £29,000 having been increased to over £49,000, and reported upon other matters connected with the scheme. The Highways Committee recommended that Tynwald Court be applied to for further borrowing powers of £20,000, in addition to the £35,000 already sanctioned in connection with the scheme. The recommendation was carried.

MR. EDWARD COUSINS, civil engineer, London, has presented his report to the Penybont Main Joint Sewerage Board, sitting at Bridgend, for dealing with the sewage of the district. He decided against an open outfall or sewage into the sea at low water mark, and submitted two estimates for the board to consider. These were—(1) For the sea outfall, the sewers having self-cleansing gradients and a brick tank sewer for containing the sewage at times when the outfall sewer is tidal locked, including penstock, tidal valves, etc., £13,642; (2) for the septic tank scheme, with filter beds on the sand banks and effluent drains into the river, capable of dealing with a population of 20,000—£18,799. The estimates did not include the purchase of any land for the tanks and filters, nor for any easement along any part of the pipe line where it passed through private property. It was unanimously decided not to take the storm water from the Bridgend and Penybont areas into the scheme, as that would cost an additional £7000.

LONDON has 3000 miles of sewers, 34,000 miles of telegraph wires, 3200 miles of gas-pipes, and 4500 miles of water mains.

THE new breakwater now being constructed by the United States Government, at Buffalo, New York, under the superintendence of Major Symonds, of the Engineer Corps, will, when finished, be the largest of its kind in the world. The first breakwater was begun in 1868; extended operations were arranged for in 1874, and only completed four years ago. The breakwater approaching completion will be 12,500ft. long, making a total length of 20,100ft. from the lighthouse to Strong Point. Next in dimensions is the famous Cherbourg breakwater, which is 12,200ft. long, and took 70 years to build.

A LOCAL GOVERNMENT BOARD INQUIRY has been held at Manchester, into the application of the Council to borrow a sum of £170,000 for purposes of sewerage and sewage disposal. The items specially referred to were £1600 for Cornbrook sewer, £5511 for Audenshaw intercepting sewer, £49,800 for reversing and connecting the old sewers with the new intercepting sewers, £9270 for improvements for flood prevention, £5000 for automatic flushing chambers for cleansing sewers, £13,050 for works at Davyhulme for intercepting the solids and adding chemicals and screening the sewage, £2500 for additional tramways and private roads at outfall works, £850 for chemical shed and steam crane, making with

contingencies and other smaller items a total of £102,370. The inspector said, with some emphasis, that the Local Government Board would not sanction a loan for artificial filter-beds unless a sufficient area of land was provided for passing the sewage over after it had been purified by the artificial filters.

As we cannot all choose our houses according to the subsoil on which they may be built, it is comforting to have in the latest of the "Memoirs of the Geological Survey" an assurance that a good deal of misapprehension exists with regard to the advantages of gravel as a subsoil and of the disadvantages of clay. In certain circumstances, we are told, either may be good, or both may be bad as sites for houses. The object of the new memoir entitled "Soils and Subsoils from a Sanitary Point of View, with especial reference to London and its neighbourhood," is to supply such information as may be needed by those who are compelled to be careful in the choice of their place of residence. Househunters are advised that they would do well to consider the general sanitary conditions connected with proposed sites, and to bear in mind that a healthy habitation depends on several considerations, apart from the nature of the subsoil. There are the elevation of the ground and other local circumstances, and more important still the construction of the house itself, its damp-proof basement, its airy and sunny position, and the system of drainage. Lastly, the water supply is of vital importance.

THE Health Committee of the Halifax Corporation have decided to meet the joint requirements of Halifax and the out districts in the matter of a smallpox hospital. The estimated cost, inclusive of site, is £16,000. The site is near the racecourse.

SIR JOHN HUTTON (the president), delivering a recent address to the members of the Sanitary Inspectors' Association, at Carpenters' Hall, London Wall, said it had long been the wish of those interested in the Association to form a fund from which members could be encouraged in their studies and researches in the interest of the public health. A liberal and practical proposal had now been made by one of their members to found a Chadwick and Richardson memorial fund. This offer was a contribution of 50 guineas, provided that, within nine months, the fund were raised to 500 guineas. The competitions for prizes would be held yearly in such form as might be deemed best, either by having special competitions, or for the best papers read at London or any other of the branch meetings. To promote longevity was an aim and result of the work of the sanitary inspector. In 1660 the rate of mortality in London was 80 per 1000 per annum, but the death-rate in the county of London in 1896 was only 18.9. Many contributory causes must have operated in producing this result, not the least of which he claimed, in recent years, to be the zealous labour of the sanitary inspector.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
ENGINEERING—			
Feb. 14	Leeds—Laundry Machinery	Union Guardians	T. Winn, 90, Albion-street, Leeds.
" 14	Clitheroe, Lancs.—Water Main	Corporation	J. E. Sharpe, Borough Engineer, Clitheroe.
" 14	Glasgow—Construction of Timber Wharfing, &c.	Trustees of Clyde Navigation	Clyde Navigation Chambers, 16, Robertson-street, Glasgow.
" 14	London, E.C.—Supply of Bridge Work	Bengal-Nagpur Railway Company Ltd.	Company's Office, 132, Gresham-house, Old Broad-st., E.C.
" 14	Millom—Timber Piling, &c.	Millom & Askam Hematite Iron Co. Ltd.	Company's Office, Millom, Cumberland.
" 14	Redditch—Electric Lighting Works. (Eight Contracts.)	Urban District Council	J. A. McMullen, Engineer, Hornchurch, Essex.
" 15	Devizes—Supply of Two Boilers	Asylum Visiting Committee	Massey and Allpress, 25, Queen Anne's-gate, Westminster.
" 15	Sheerness—Designs and Tenders for Iron Pier	Urban District Council	C. A. Copland, Council's Surveyor, Trinity-road, Sheerness.
" 15	Widnesbury—Widening Bridge. (Two Contracts.)	Corporation	E. M. Scott, Borough Engineer, Town Hall, Widnesbury.
" 16	Middleton—Supply, &c., of Purifiers	Corporation	T. Duxbury, Gas Engineer, Gasworks, Middleton.
" 17	Birmingham—Construction of Well, &c. (3 Contracts.)	Baths and Parks Committee	Engineer of Baths and Parks Dept., Kent-st., Birmingham.
" 19	Rochdale—Dynamo, Ballancer, and Boosters, &c.	Corporation	Lacey, Clirehugh, and Sillar, 10, Delahay-st., Westminster.
" 19	Portland—Waterworks	Urban District Council	E. J. Elford, Engineer, Council Offices, New-rd., Portland.
" 19	Uppermill—Rebuilding Bridge	West Riding County Council	J. V. Edwards, County Surveyor, Wakefield.
" 21	Bridgnorth—Pipe Laying, &c.	Corporation	J. Taylor, Sons, & Santo Crimp, 27, Gt. George-st., Westminster.
" 22	Plymouth—Construction of Dock Entrance, &c.	Great Western Railway Company	Engineer, G. W. R. Station, Plymouth.
" 23	Martley, near Worcester—Water Supply Works	Rural District Council	A. W. Knott, Clerk, 14, Foregate-street, Worcester.
" 26	Denbigh—Provision of Cooking Apparatus, &c.	Asylum Guardians	C. O. Ellison and Son, Sir Thomas-street, Liverpool.
March 2	Middlesbrough—Extension of Dock	North-Eastern Railway Company	Sir J. W. Barry, 21, Delahay-street, Westminster.
" 2	Pallion, near Sunderland—Construction of Bridge, &c.	North-Eastern Railway Company	C. A. Harrison, Central Station, Newcastle-on-Tyne.
" 12	Dorstone, Hereford—Carriage Bridge	County Council	H. T. Wakelam, County Surveyor, Shire Hall, Hereford.
" 17	Sophia, Bulgaria—Electric Lighting Town	Secretary of State for War	The Mayor, Sophia, Bulgaria.
April 27	London, S.W.—Electric Search Light Apparatus	Hygienic Commission	A. Major, Director of Army Contracts, War Office, Pall Mall.
July 31	Tangier—Water Supply	Corporation	Commercial Department, Foreign Office, London, S.W.
No date.	Margate—Sinking Borehole	Northampton Rural District Council	A. Latham, 15, Cecil-square, Margate.
"	Kislingbury—Reservoir	Parish Council	W. Hall, 12, St. Giles-street, Northampton.
"	Whittlesea—Kilns, Machine Sheds, &c.	Parish Council	F. H. Cooke, Surveyor, Peterborough.
"	Weedon—Laying Out Grounds, &c.	Parish Council	J. B. Williams, Surveyor, Moot Hall, Daventry.
IRON AND STEEL—			
Feb. 12	Blackburn—Supply of Street Picks, &c. (21 Contracts)	Corporation	W. Stubbs, Borough Engineer, Municipal Offices, Blackburn.
" 12	Ilkley—Supply of Cast-iron Socket Pipes	Urban District Council	W. B. Woodhead, 18, Exchange, Bradford.
" 12	Belfast—Various Stores	Belfast and County Down Rly. Co.	T. J. Brittain, Secretary, Queen's Quay Terminus, Belfast.
" 14	London, E.C.—Supply of Iron Piping, &c.	Burma Railways Co. Ltd.	Company's Office, 76, Gresham House, Old Broad-st., E.C.
" 15	Croydon—Cast Iron Pipes	County Borough	Borough Engineer, Town Hall, Croydon.
" 16	Birkenhead—Supply of Stores and Materials	Corporation	C. Brownridge, Borough Engineer, Town Hall, Birkenhead.
" 21	London, S.W.—Supply of Steel Rails and Fishplates	Corporation	Agent-General for Victoria, 15, Victoria-street, S.W.
PAINTING AND PLUMBING—			
Feb. 14	Blackburn—Painting, &c., at Hospital	Health Committee	W. Stubbs, Borough Engineer, Municipal Offices, Blackburn.
" 14	Prestwich, Lancs.—Painting Asylum	Committee of Visitors	Superintendent, County Asylum, Prestwich.
No date.	Nottingham—Chapel Cleaning and Decoration	Committee of Visitors	A. Marshall, Architect, King-street, Nottingham.
ROADS—			
Feb. 12	Richmond, Surrey—Supply of Road Materials, &c. (Eight Contracts)	Town Council	F. B. Senior, Town Clerk, Town Hall, Richmond.
" 12	Lancaster—Kerbing, Paving, &c., Road	Streets Committee	Borough Surveyor, Town Hall, Lancaster.
" 12	Peterborough—Cartage of Materials	Gas Company	J. Barlow, Manager, Gasworks, Peterborough.
" 12	Spilsby—Supply of Broken Granite and Slag	Rural District Council	F. J. Dixon, District Surveyor of Highways, Spilsby.
" 12	Nottingham—Formation of Road	Public Parks Committee	A. Brown, City Engineer, Guildhall, Nottingham.
" 12	Oundle—Cartage, &c., of Granite, &c. (Two Contracts)	Rural District Council	N. E. Dixon, Council's Surveyor, Oundle.
" 12	Hendon, N.W.—Granite, Limestone, Slag, &c.	Urban District Council	S. S. Grimley, Public Offices, Hendon, N.W.
" 12	Rugby—Granite	Rural District Council	J. W. Pender, Union Workhouse, Rugby.
" 14	Islington, N.—Wood Paving	Vestry of St. Mary	J. P. Barber, Vestry Hall, Islington, N.
" 14	London, N.W.—Supply of Broken Granite, &c. (Fourteen Contracts)	Hendon Urban District Council	S. S. Grimley, Council's Engineer, Public Offices, Hendon, N.W.
" 14	Banbury—Supply of Stones, &c.	Rural District Council	E. L. Fisher, Clerk, Horse Fair, Banbury.
" 14	Chesterfield—Supply of Slag and Limestone	Rural District Council	T. A. Busbridge, Surveyor, Eckington.
" 14	Chesterfield—Team Labour	Rural District Council	T. A. Busbridge, Surveyor, Eckington.
" 14	East Retford—Supply of Granite	Lambeth Vestry	J. D. Kennedy, Borough Surveyor, East Retford.
" 14	London, S.E.—Supply of Granite, &c.	Rural District Council	J. P. Norington, Vestry Hall, Kennington-green, S.E.
" 14	Macclesfield—Supply of Roadstone, &c.	Shoreditch Vestry	Assistant Clerk, Union Offices, Macclesfield.
" 15	London, E.C.—Wood Paving Carriageway	Urban District Council	J. E. Dixon, Surveyor, Town Hall, Old-street, E.C.
" 15	Tottenham—Works and Materials	Vestry of St. Mary	E. Crowne, 712, High-road, Tottenham.
" 16	Westminster, S.W.—Works and Repairs, Ballast, &c.	Corporation	G. E. W. Wheeler, Town Hall, Caxton-street, S.W.
" 16	Birkenhead—Horses, &c., for Street Watering, &c.	Corporation	C. Brownridge, Borough Engineer, Town Hall, Birkenhead.
" 16	Birkenhead—Supply of Flags, Granite, &c.	Corporation	C. Brownridge, Borough Engineer, Town Hall, Birkenhead.
" 16	London, N.W.—Broken Granite, Ragstone, &c. (Twenty Contracts)	Vestry of St. John, Hampstead	Surveyor, Vestry Hall, Hampstead, N.W.
" 16	Sevenoaks—Rural Extension	Rural District Council	W. S. Fox and Taylor, Surveyors, Edenbridge, Kent.
" 16	London, E.C.—Paving, Wood Blocks, &c.	St. Luke's, Middlesex Vestry	G. W. Preston, Clerk, Vestry Hall, City-road, E.C.
" 16	London—Supply of Broken Granite, &c.	Hammersmith Vestry	Surveyor, Town Hall, Broadway, Hammersmith.
" 16	Greenwich—Paving	Board of Works	141, Greenwich-road, S.E.
" 17	West Bridgford, Notts.—Paving Footpaths, &c.	Urban District Council	W. Pare, Surveyor's Office, Bridge-grove, West Bridgford.
" 17	London, W.—Asphalt Paving	St. James's Vestry, Westminster	T. H. Munsey, Vestry Clerk, Vestry Hall, Piccadilly, W.
" 19	Bedford—Broken Granite, Slags, Flints, Gravel (Four Contracts)	County Council	County Surveyor, Shire Hall, Bedford.
Feb. 21	Headington—Supply of Flints, &c.	Rural District Council	L. Turner, Hartfield Cottage, New Headington, Oxon.
" 21	London, N.—Supply of Granite, Ballast, &c. (19 Contracts.)	Vestry of St. Mary, Islington	W. F. Dewey, Clerk, Vestry Hall, Upper-st., Islington, N.
" 24	Kingston-on-Hull—Hardwood Paving, Flagging, &c.	Corporation	A. E. White, Town Hall, Hull.
" 28	Manchester—Supply of Horses, &c.	Watch Committee	Deputy Chief Constable, Town Hall, Manchester.
March 9	Belper—Road Materials	Rural District Council	R. C. Cordon, Surveyor, Hazelwood, Derby.
No date.	Anstey—Road	Corporation	A. F. M. Downie, Alton, Hants.
"	Harrogate—Leveling, Paving, &c.	Urban District Council	S. Stead, Borough Surveyor, Municipal Offices, Harrogate.
"	Brierfield—Sewering, Paving, &c. (Two Contracts.)	Urban District Council	J. T. Landless, C.E., Station Buildings, Nelson.
SANITARY—			
Feb. 14	Birkenhead—Removal of Night Soil	Corporation	Chief Inspector of Nuisances, Town Hall, Birkenhead.
" 14	Tipperary—Construction of Sanitary Works	Workhouse Guardians	J. Gubbins, Clerk, Workhouse, Tipperary.
" 16	Burnley—Pipe Sewers, Manholes, &c.	Rural District Council	S. Edmondson, 18, Nicholas-street, Burnley.
" 16	Sevenoaks—Drainage Works, &c.	Rural District Council	Fox and Taylor, Surveyors, Edenbridge, Kent.
" 16	Cheadle, Staffs.—Sewer and Six Manholes	Rural District Council	F. T. Inskip, Surveyor, Brook House, Cheadle.
" 16	Hove—Stoneware Pipes, Traps, &c.	Urban District Council	H. H. Scott, Town Hall, Hove.
" 17	Aston Manor, Birmingham—Construction of Pipe Sewer	Urban District Council	H. Richardson, Engineer, Council House, Aston Manor.
" 17	Cork—Construction of Sewers	Union Guardians	J. Cotter, Clerk, Board-room, Cork Workhouse.
" 18	Uxbridge—Construction of Pipe Sewers, &c.	Rural District Council	J. Anstie, 17, Victoria-street, Westminster.
" 19	Lutterworth—Construction of Main Sewer	Rural District Council	J. C. Coates, Council's Surveyor, Bitteswell, nr. Lutterworth.
Mar. 2	Oldham—Concrete Sewer	Surveyor's Committee	S. A. Pickering, Borough Surveyor, Oldham.

"	Lewisham, S.E.—Designs for Clock Tower	Local Committee.

HAMPTON COURT PALACE.*

By JOHN BELCHER.

THE public buildings of this country receive scanty recognition as works of architectural merit. As a nation we have little respect for anything outside our commercial interests, and it is not surprising that there is indifference to, or ignorance of, Architecture, seeing that it is regarded by the many as a mere decorative or advertising medium. Where any historical interest envelops a public building it is visited and admired, though its Architecture *per se* may fail to delight or stir emotion. In speaking of a building like Hampton Court, I shall consider it from the architectural standpoint, and not be biased by any sentimental regard for its ancient charms. The glamour of mediævalism is apt to tempt some to invest any ancient building with a superior architectural value. Without undue reverence for the past, we may safely allow our admiration and affections to go out to every part of Hampton Court, and we can make use of its archaeological facts, to trace the architectural developments made necessary to meet advanced requirements. Most palaces come under the category of "Public Buildings," but Hampton Court has the further distinction of being

A COMBINATION OF DOMESTIC AND PUBLIC BUILDING.

It is not only a building for State purposes and ceremonies, containing a series of reception rooms, with a few Royal living rooms, also, of more or less public character, but it is a palace which exemplifies both the stately magnificence which appertains to Royalty, and the domestic life peculiar to and fostered by this country. Its beginnings may have imparted to it the homely character it still retains. Before it became a Royal palace, there was a country mansion on the site, and to this Wolsey probably added his palace. We find it spoken of as a small "Manor House on the bank of the Thames, standing in about 2000 acres of land." It belonged after the conquest to the De St. Valery family, who in 1217 handed it over to the Knights of St. John of Jerusalem. About three hundred years later this estate, with the Manor House, which has always been known as "Hampton Court," was leased for ninety-nine years to Cardinal Wolsey, at a rent of £50 a year. From this time, its history as a palace commences, and building operations on an extensive and commendable scale were proceeded with. Our sympathies at once go out to

THE FORTUNATE ARCHITECT.

But it is not very clear whether there was any architect, for such works were most frequently carried out by a combination of artists who worked together on traditional lines in perfect harmony—the architect, the master mason, the master carpenter, and all the several artificers keeping within the limitations of their respective crafts and thoroughly understanding the needs of each. Probably the men were accustomed to work together without drawings, much as the Hungarian gipsy bands discourse their wild music without knowing anything of musical notation. No doubt there was a leader or supervisor, whether called surveyor of works, or clerk of works, or (later) architect. He was "first amongst equals." Seventeen years later, when the work was carried on by Henry VIII., there are two names mentioned in the Hampton Court bills—Henry Williams, a priest, "Surveyor of Works" at Hampton Court, who would appear to have supervised all the details, and Eustace Mascall, who was "Clerk of Accounts." The latter is sometimes spoken of as the "Clerk of the Works," and was also clerk of the works under the Cardinal for his College at Oxford, where the details are similar to those at Hampton Court. It is interesting to note that these titles are still kept up at Hampton Court—there is still the

"Clerk of the Works," the "Master Mason," the "Master Carpenter," and so on. These and

THE TRADITIONAL METHODS

have been passed down from the sixteenth century without any break. Mr. Law, the able historian of Hampton Court, to whom I am indebted for so many details which his patient research has brought to light, remarks that, after an examination of the carefully preserved accounts for the several works during the reign of Henry VIII., he finds that the workmen were all Englishmen. He says "Even the most delicate carvings and paintings of the roof of the Hall, which are sometimes stated to have been the work of Italians and other foreigners, are proved to have been entirely executed by men so palpably Anglo-Saxon as Michael Joiner, Richard Ridge, of London, John Wright, of South Mimms, John White, of Winchester, John Hobbs, Henry Blankston, John Hathe, Reginald Ward, of Dudley, John Spencer, of Hampton, John Reynolds, of East Moulsey, &c." This, of course, is highly satisfactory. Still, we know that both Wolsey and Henry VIII. had part in bringing about that development of Architecture which we know as the Renaissance, for they both imported Italian workmen, and they both employed them at Hampton Court on decorative work. These foreigners were not builders, but only carvers and decorators, and we can trace their influence in the work of the Englishmen.

THE WELL-KNOWN TERRA-COTTA ROUNDELS

on the gateway turrets were made by an Italian, Giovanni de Majano (£2 6s. 8d. each). They were similar to the terra-cotta busts used by Holbein in the gateway at Whitehall, and like them were fixed in the turrets. This use of terra-cotta is fair and legitimate. It is obviously not a constructive material, and the early instincts of the honest builder kept it in its proper place. Another example is in the plaque containing Wolsey's arms—also in terra-cotta. These and the roundels have well-developed Renaissance details, which were evidently not regarded as in any way incongruous by Wolsey or Henry VIII. The ceiling and frieze in "Wolsey's closet" is, like other plaster work of the period, no doubt the work of Italians. On the other hand, the great pendants of the hammer-beam roof of the Great Hall, which are Italian in character and feeling, were the work of a Londoner, Richard Ridge, who had come under the refining influence of the Renaissance. We will now pass through the buildings erected by these workmen

UNDER WOLSEY AND HENRY VIII.

It is not improbable that the old Manor House, which he found on the site, was incorporated by Wolsey in his new building. This would seem the more likely, as, about a year after the commencement of the work, he received the King and Queen there. And in some old prints there is represented what might be the old manor in the centre of the east front. No trace of this is left, so that the matter is one of more interest to the archaeologist than the architect. Wolsey was a man of large ideas and sumptuous taste, and the magnificence of his palace filled his countrymen and foreigners with envy. The King himself evidently coveted it, and rather prematurely took possession of it. It was evidently a palace quite up to date in its arrangements and appointments. It was natural that the plan should partake of the collegiate quadrangular form. Yet on the west front there is a new departure to be noted, for at the western entrance two projecting wings form a three-sided court, each wing, however, containing smaller internal courts. It is difficult to determine exactly how much was included in Wolsey's palace, or how it was developed by Henry VIII., but I think Wolsey may have credit for the largest share in the scheme.

THE REGULARITY OF THE PLAN,

and especially of the entrance and first courts, proves this. It is true that the south and east fronts are represented on old plans and prints as very irregular, but existing buildings or

other needs may account for this. Hampton Court soon became a Royal palace, and from Henry VIII. to George IV. alterations and additions were in frequent progress. Those made by Henry VIII. considerably added to its attractiveness and importance. His work consisted largely in decorating and beautifying the existing structure, and in remodelling certain parts to make these suitable to the Royal requirements. He affixed the Royal arms, and added badges and heraldic devices, such as the rose, the portcullis, the fleur de lys, and crown on the buildings. Parapets and pinnacles were added, and the whole building "restored" quite in the modern manner. It is this treatment which increases the enjoyment of the archaeologists, who are apt to look coldly upon the

SUBSEQUENT ADDITIONS BY SIR C. WREN

about which no mistake can be made, and where there is nothing to argue about on the score of date. Who was responsible for the several buildings it is fortunately not necessary for me to determine—though the facts are interesting, it is rather the result which concerns us. It is impossible for me to do more than point out those parts and effects of the buildings which have struck me as worthy of attention, and I may perhaps be forgiven if I dwell rather longer and more lovingly upon the later Renaissance work than upon any other part. But before addressing myself to this congenial part of my subject I must direct attention to all that is good and excellent in the earlier work of the Tudor period. Perhaps the first thing that strikes us is the beautiful colour effects, partly due to age and atmosphere, but partly also to deliberate design. No doubt it was convenient—but it is thus proved to be a right principle—to use local materials as far as practicable. The bricks, we are told, came from Brouxham, Taplow, and other adjacent localities. Some of the stone came from quarries in Reigate, Barrington, and similar places, but Caen stone was also used where these were unsuitable. The oak was brought in large quantities from Dorking, Holmwood, Leatherhead, Banstead, Bere-wood, and St. John's Wood.

WITH REGARD TO THE EXTERNAL EFFECTS.

the beautiful texture was obtained by the inequality of the bricks, and the use of vitrified bricks in squares and lozenges. It is this which imparts to the whole that purple tone which is so admired. I do not believe that this was done from a dislike to plain surface—that is a modern complaint—because there is no great regularity in the position of the hatching, but it is touched in, much as an architectural draughtsman might resort to a little cross hatching to suggest colour to the surface. This treatment of the surface has been carried a little further in the first court, where there is a frieze or band of lozenges regularly placed and repeated. I draw attention to it as it occurs again in the Hall and Clock Court. This does not prove that the Hall was not the original one built by Wolsey, thought it was not then the habit to reproduce and copy the original work on making additions. I am inclined to believe that Henry VIII. did not rebuild

WOLSEY'S HALL,

as has been thought, but that he merely put on a new roof or otherwise finished it. The Hall is by no means larger than many noblemen's halls which were in existence when Wolsey commenced his. Penshurst had been built in 1520 and New Hall in 1524, and Wolsey was not a man to submit to be outdone by others. Originally there had been an open lantern in the roof to let out the smoke from the wood or the fire-dogs in the centre of the floor, as seen in the older hall at Penshurst; but there is no sign of there ever having been one in the present roof. The use of chimneys, especially of shafts or terminals, was recent, and attention was drawn to this aristocratic novelty by the elaborate and varied treatment of the shafts. It is this frank treatment of a new feature or requirement which we do well to note. Instead of hiding it, or endeavouring

* A paper read before the Architectural Association on Friday, February 4th.

to represent something else of an earlier date, advantage is taken of it in the design. Its purpose is recognised, while it is used as a decorative feature. Most, if not all, of these cut brick chimney terminals have had to be rebuilt, and pipes have been introduced to make them more operative. It should be remembered that they were more or less an experiment. As a picturesque feature they are so successful that they have been imitated, though not rivalled, during the Gothic revival, whereas the men of the "Later Renaissance," such as Wren, still following true principles, discarded the separated shafts for the practical reason that by grouping or combining several flues in a square mass they gained in effectiveness. It is obvious that if the flue exposed to the external air is of thin brickwork (and that cut) it will be cold and the smoke will not pass easily; whereas if the flues are grouped together and have good outside enclosing walls, like the large chimney stacks of the later work by Wren, they will be serviceable. Again, those

CHIMNEY BREASTS AND STACKS,

especially on the west front, illustrate how the spirit of the Renaissance was already at work in the feeling after uniformity and balance of parts. Indeed this west front becomes a "façade" by its dignified regularity, and is a new departure in domestic building. Its form is the prototype of many mansions of a later date. We must not linger outside, but return to the "Clock Court." Here are the entrances to the Royal apartments. Opposite to the Clock Tower is the entrance to the Queen's Great Staircase. This has been disfigured by some Gothic revivalist in the reign of George II. who has somewhat needlessly affixed the date 1732 to his work. It is injurious to look at, and fortunately there is something else which instantly commands our attention. On the south side is the entrance to the King's Great Staircase, and now the wider we open our eyes the better. Here is something essentially masculine. Here we have our first taste of

THE LATER RENAISSANCE WORK.

The magnificence of that colonnade in scale and proportion impresses us at once. Even Mr. Law, whose archaeological sympathies are centred upon the Tudor work, and who cannot forgive Wren for removing or hiding any of it, admits that this colonnade is most creditable. It is in itself, he says, very handsome, "though out of place amidst Tudor surroundings." For my part I cannot imagine anything finer for the purpose. It tells its tale quite plainly; and without pretending to belong to the original building, it takes its proper place in its history, and brings it up to the date. I find myself speechless before it. What is it which gives it such impressive charm? We know it is 89ft. 4in. in length; that it is 20ft. 6in. in the clear inside, and the height to the top of the parapet is 27ft. 9in.; but these dimensions are nothing extraordinary. It is the exquisite proportion, the subtle setting out of the spaces which entrances the beholder. That trick of coupling the columns, which Wren learnt from Bernini in Paris, and which he employed at Chelsea and Greenwich Hospitals, is effectively made use of here. But instead of what is known as "Wren's favourite Doric," just look at those Ionic caps! You must go and sketch them carefully to appreciate them. The carving of these and of the vases with ornamental trophies under them which mark the centre, is all excellent.

THE COLONNADE

faces the north; yet you never seem to want the sun to brighten it up, so admirably is it lighted and so well do the internal reflections dispel all gloom. The irregular setting out of the ceiling is the only thing I have never quite liked. I feel the same at Greenwich, where the ceiling under the regular colonnade is broken up. The continuous coffer would, I should imagine, have improved the perspective. But Wren did nothing without a purpose, or without consideration, and I should much like to know his mind upon it. I should

like also to keep you longer at this colonnade, but I have other interesting works to inspect with you. This entrance, while it does not in any way clash with the surrounding buildings in this court, is the legitimate outcome of the Renaissance initiated by Wolsey and Henry VIII. Standing in this court you can take in the condition and progress of Architecture from Wolsey's time in 1514 to George II.'s in 1732. It was not the influence of William III. which brought about this result, for we know that before his accession in 1698

SOME OF THE FINEST WORKS OF THE RENAISSANCE

had already been carried out. In 1619 Inigo Jones had made his wonderful design for a Palace at Whitehall, and the small sample of his intended work was built. In 1678 the library of Trinity College was built by Wren. St. Paul's was commenced 1675, Chelsea Hospital in 1682, Winchester Palace (intended to rival Versailles) in 1683, and Kensington Palace in 1689, so that many notable buildings were built or in hand, and Architecture was developing rapidly. If at Hampton Court the transition may seem sudden, we have to remember that no structural additions of any importance were made from Henry VIII's time until William and Mary's reign—i.e., 1530 to 1690. Only in the internal fittings and decorations is there any indication of the early Renaissance. Little was done in Elizabeth's reign, except in the garden; only a few rain-water beads have her initials on them, and these, like those of Henry VIII., are decidedly Renaissance in character. In James I.'s reign Inigo Jones was appointed surveyor in 1615, but I cannot discover any work of his in existence. His time was probably taken up in arranging the masques in the Great Hall for the Queen, and his imagination was exercised in wonderful architectural vistas and scenic effects. Mr. Law tells us in his interesting book that the players were a company entitled the "King's Company of Comedians," who had been incorporated by a warrant of King James a few months before, and that the second name on the roll is that of William Shakespeare, who was no doubt present in the palace. Even in Elizabeth's time

THE SCENERY

was of a most realistic character, so that in spite of the general idea to the contrary, stage scenery is by no means modern, though it may be more perfectly adapted now. It was fortunate for William and Mary that with the occasion for additions, there was the man at hand. The King was delighted with the place and its capacities, and determined to bring it up to date, as he considered it wanting, as no doubt it was, in many of the conveniences of a modern palace. Mr. Law suggests that William was captivated by the long straight canal fringed with avenues of lime trees—such as met his eye at Haarlem and the Hague. I admire the King's taste; and the canal is a most effective feature. But I must not digress. Wren was set to work, and fortunately for him there was no society for the preservation of ancient buildings in his time, and not being a sentimental person, and having no great sympathy for Tudor work, or for that part of it which was irregular and broken up, he did away with the irregular and inconvenient south and east fronts. If we examine

WREN'S PLAN

we can readily see that it was determined by the aforesaid long canal on the east side. A centre line drawn from this to a point cutting the lines of the converging avenues would, to the mathematically-minded Wren, give the centre and building line of the new front, and this front would be at right angles with the centre line. From the centre to the south corner the length covers the old buildings, and, of course, the length from the centre to the north corner is just equal to it. The total length of this front is 300ft. Again, the south front is at right angle with the east, and is 315ft. long, a length which was fixed also by the buildings existing in the rear. Behind

these fronts was an old court, called "Cloyster Green Court." The position of this court could not be altered by Wren in his reconstruction, and he therefore built on the old lines the new court known as Fountain Court, without reference to the centres of the new south and east fronts. The court is 116ft. 10in. on the north and south sides. The east side is 110ft. lin., but the west is 1ft. lin. shorter. This arises, as we may gather from the plans, in effecting a junction with the old and irregular walls. These works, commenced in 1689, were left unfinished at the death of Queen Mary in 1694, and little further was done until 1698, when the destruction of the palace at Whitehall by fire determined the King to complete his palace at Hampton Court.

(To be continued.)

KEYSTONES.

THE final audit of the account for the restoration of the fabric of Gloucester Cathedral states that the total sum raised is £9789.

THE new club house of the Lytham and St. Anne's Golf Club cost over £10,000, and is on the new links between Lytham and St. Anne's.

THE foundation-stone has been laid of new premises for the Mosely Social Club, to be erected at a cost of £675. Mr. J. Brewin Holmes is the architect.

SIR JOSEPH CROSLAND has made a gift of £1000 to a fund for the erection of a church in the parish of St. Barnabas's, Crosland Moor, Huddersfield.

THE Manx Tynwald Court has insisted upon an inquiry into the causes of the proposed additional £20,000 expenditure on Douglas drainage, the total now being £55,000.

AN enquiry has been held at Birmingham in reference to the application of the City Council for sanction to borrow £10,000 for the site of a new lunatic asylum, and £12,510 for the erection of a refuse destructor.

A WESLEYAN CHURCH has been erected at Acrefair—a mining village midway between Llangollen and Ruabon—at a cost of £1000. Mr. J. W. Jones, Brooklea, Acrefair, was the architect.

THE Trowbridge committee having charge of the arrangements for technical and secondary education are taking steps to erect central and commodious premises on the recently acquired site at the top of Castle Street. The scheme is estimated to cost fully £10,000.

THE old Horse and Groom, at the corner of Leather Lane, Holborn, which is to be demolished, is said to date back at least 300 years. It was not, in old times, a public house, unless it has changed its sign, for Strype, although he mentions three inns—the White Hart, the Nag's Head, and the King's Head—does not refer to a Horse and Groom.

A LOCAL GOVERNMENT BOARD enquiry has been held at Newcastle-on-Tyne into the application of the City Council for sanction to borrow £3723 for alterations and improvements to the Town Hall and the Guildhall, £1000 for the provision of an underground lavatory, &c., in Shakespeare Street, and £1000 for alterations at the Northumberland Baths.

ISLINGTON having some time ago acquired of the City Corporation two open spaces beside the Caledonian Road Cattle Market, the local vestry surveyor estimated that £10,500 would be needed to lay the grounds out in an attractive manner. His plans included a museum for "natural objects," designed for the instruction of youth. The vestry has cut down the estimates to £8000. The majority of the vestry were opposed to the museum as unnecessary.

THE M'Ewan Hall having been opened, the contractors for the Edinburgh University Extension Scheme entertained the clerk of works, Mr. Allan E. L. Clark, to dinner in the Royal Hotel a few evenings ago, and presented him with a handsome silver replica of the Warwick Vase and a tachometer, in recognition of his labours and unfailing courtesy during the twenty years in which he has been engaged superintending the progress of the University buildings.

L.C.C. WORKS DEPARTMENT.

LOSSES AND GAINS.

THE adjourned report of the Finance Committee, submitting half-yearly statements of works executed by the Works Department for the half-years ended March, 1897, and September, 1897, was considered at the meeting of the London County Council recently. The "losses" on ordinary works up to the latter date showed them to amount to £24,485 8s. 9d. On "jobbing works" up to the same date a total profit of £4,683 7s. 1d. was shown. In his report upon the losses, Mr. Adams, manager of the Department, stated that some of the works, although only recently reported, were executed during 1896, previous to his having control of the Department, and others were so far advanced that it was not possible to effect any improvement before they were completed. On the other hand, there had been errors of judgment and defects in the organisation, which must have been accountable for some portion of the losses in two or three instances. He had endeavoured to remedy this, and had largely reorganised the general working of the Department. Work which formerly it had been customary for the Department to put out to tender was now done by their own men at a large saving. They could not hope that they would be as successful in every work any more than a contractor would be, but there was no doubt that they would reap a large benefit during the coming year from the improvements which had been carried out.—The Finance Committee also presented a "statement of the whole of the estimated works commenced, completed, and certified since the change in management in December, 1896." This was as follows:—

Name of Work.	Estimate.	Cost.	Saving.
	£ s. d.	£ s. d.	£ s. d.
Boundary Street—Churchyard wall	1,149 8 7	1,026 12 5	122 16 2
Boundary Street—Paving Central Avenue	143 12 0	109 19 10	33 12 2
Westminster Fire Brigade Station—Painting	98 19 7	82 5 2	16 14 5
Waterloo Fire Brigade Station—Painting	176 3 4	154 17 0	21 6 4
Battersea Park—Painting	1,942 8 0	1,897 9 5	44 18 7
Mill Lane—Paving	7,749 17 2	4,754 10 6	2,995 6 8
Boundary St.—Temporary roads	119 16 0	112 9 1	7 6 11
Deptford Fire Brigade Station—Alterations	658 8 5	489 13 0	168 15 5
Rotherhithe Fire Brigade Station—Repairs	71 9 8	67 10 0	3 19 8
Wandsworth Common—Escape Standing	942 12 5	897 3 4	45 9 1
Wood Lane—Paving	130 0 0	122 1 3	7 18 9
St. George's Road—Drainage	237 15 0	233 14 6	5 0 6
Central Works—Making good foundations of old workshops	232 12 1	204 12 4	27 19 9
Scotland Yard Fire Brigade Station—Sanitary work	694 2 0	529 16 1	164 5 11
Lincoln's Inn—Painting and repairing railings			
Lincoln's Inn—Painting shelter			
Totals	14,347 4 3	10,681 13 11	3,665 10 4

This shows a saving at the rate of 25½ per cent. The Committee also gave a table of the jobbing works certified since the change in management, of which the total schedule value figures at £25,308 10s. 7d., and the total actual cost at £23,150 7s. 3d., showing a saving of £2158 3s. 4d., or 8½ per cent. Putting estimated and jobbing works together, the estimate comes out at £39,655 14s. 10d., and cost at £33,832 1s. 2d., showing a total saving of £5823 13s. 8d., or 14½ per cent.—After considerable discussion the reports were adopted by the Council.

PUBLIC WORKS.

Upon the recommendation of the Finance Committee, it was agreed to lend the Hamstead Vestry £5900 for paving works, and additions to the vestry hall; the Lewisham District Board £18,225 for sewage and other works, coroner's court, &c.; the Wandsworth District Board £4000 for paving works; the Guardians of the Holborn Union £8400 towards the cost of the erection of a laundry, and for alterations and additions at the Mitcham Schools; and the Poplar Guardians £15,560 to purchase schools.

Professional Items.

ABERTILLERY.—A new school for the Abertillery Intermediate School district, which comprises the area from Nantyglo to Crumlin, in the Western Valleys of Monmouthshire, has been erected. Messrs. Swash and Bain, of Newport, were the architects, and Mr. David Lewis, of Llanhilleth, was intrusted with the contract. The school, which is of two stories, provides class-room accommodation on the first floor for forty girls. There are also a class-room for cookery, provided with rising tiers of seats and the usual apparatus, and a commodious assembly hall, centrally placed, in conjunction with which, by an arrangement of revolving shutters, an adjoining class-room can be used. The hall, class-rooms, and corridors are finished throughout with stained and varnished wood dadoes, and the internal roof has open timber with carved and moulded brackets. The boys' department occupies the ground floor, provision being made in the respective class-rooms to accommodate sixty boys. There is a chemical laboratory, with up-to-date fittings, &c. Private rooms are provided for the master and mistress on the first and second floors respectively, as well as store-rooms and cloak-room accommodation. The floors are sound-proof and fire-proof. The external walls are built with hammer-poled local stone, the dressings being of Bath stone and Ebbw Vale buff brick. The contract amounts, together with the cost of retaining walls, to £2430.

AYR.—A new church is to be erected in Ayr on a site at the angle of Midton and Carrick Park Roads. The church has been designed by Mr. John B. Wilson, Glasgow. Gothic of

a limited area, a wide nave and aisles have been adopted, occupying an area of 80ft. by 60ft. Above the aisles are spacious galleries, supported on cast-metal columns, which also carry arcading, on which rest the main roof timbers. The main front faces York Road, and is flanked on the south side by a massive tower with octagonal turrets, above which rises a stone spire, with gilt copper vane 125ft. high. Double light traceried openings are placed in the tower, which also contains a staircase to the gallery. On the opposite angle a second staircase affords additional accommodation. A five-light, richly-cusped, and mulioned window forms the central feature of the façade, which is surmounted by a lofty gable, with stone finial. Access to the vestibule is gained through two wide moulded doorways, having engaged shafts, with moulded and carved caps, from which spring Tudor arches. An ornamental cornice adds richness to this portion of the front. The side walls have boldly projecting buttresses with recesses between them, each pierced by a lofty, pointed window. Paterae are placed in the eave cornices, and on the sides of the main gable. As far as possible the interior has been designed to harmonise with the style selected. The windows are filled with cathedral glass having varied tints and borders. The pulpit has mouldings and columns of American walnut. A special feature has been made of the ceiling, which is divided into a series of panels, moulded and sheeted. Mr. Thomas McMillan, Ormeau Avenue, was the contractor, and Messrs. Young and Mackenzie the architects. The heating has been executed by Messrs. Musgrave and Co., Limited, and the ornamental gasfittings by Mr. G. Jones, Great George's Street.

BRISTOL.—The design for the new reredos to be placed in Bristol Cathedral, as a memorial to Bishop Ellicott, is an elaborate structure in stone of a size and importance proportionate to the cathedral. It is upwards of 17ft. wide, and rises to a total height of 27ft. from the floor of the sanctuary. The lower part behind and above the altar is plain, with a tall centre panel to inclose the altar cross; on either side of the upper half of this panel is an enriched arcade of four divisions. Above this lower part the centre portion (which takes the width of the altar and is about 10ft. wide) is corbelled boldly forward, and to the right and left of this there are enrichments from the floor upwards of traceried panelling, surmounted by niches, with figures of Old Testament Saints on the left, and New Testament Saints on the right. Above the level of the top of the corbelling, before mentioned, the whole of the reredos has one general treatment of wide niches in one, two, and three tiers, with elaborate canopies and pinnacles, separated by narrower features, also enriched with niches and sculpture. The Crucifixion, with SS. Mary and John occupies the centre niche. Other niches contain figures of saints and angels, with their emblems. The lower part of the back, or eastern side of the reredos, is also richly panelled up to a height of 14ft., and above this it is divided up by buttresses with a series of niches. The centre one contains a representation of the Presentation in the Temple, and on either side of this St. Mary and the Archangel Gabriel (representing the Annunciation). There are other niches containing figures of saints and angels. A panelled and traceried screen 11ft. high, with buttresses and pinnacles, separates the eastern bay of the choir from its eastern chapel, flanking the reredos on either side.

CARDIFF.—Plans have been prepared by Mr. Frame, architect for the Marquess of Bute, for a suite of state apartments to be added to Cardiff Castle. The contract has been let to Messrs. W. Thomas and Co., contractors, Cardiff, by whom the foundations are now being put in. The new wing, as it is termed, will be inside, and parallel with the southern wall of the Castle, commencing near the clock tower. It will be, of course, connected with the main portion of the building.

BELFAST.—Castleton Church, recently erected at York Road, has just been opened. The style of architecture is Tudor Gothic, as the materials were red brick, with stone from Aspatria sparingly introduced. As a large congregation required to be accommodated in

DUNDEE.—The Salaries Committee of Dundee School Board have had under consideration the salary of the architect. It appeared that Mr. Langlands was paid for general superintendence and attention to the repairs of the schools at an annual salary of £30. When that remuneration was fixed, however, he was from time to time in receipt of commissions on the work of erecting new schools and adding to existing buildings, these commissions forming a very considerable addition to his salary. For some years this source of revenue has disappeared, and the consequence is that Mr. Langlands now receives £30. The committee were generally of opinion that the salary was inadequate for the labour, trouble, and responsibility attaching to the office. At the same time several members thought it would be desirable, before any augmentation took place, to have before them a return for the last ten years of the total emoluments of Mr. Langlands, and a resolution was moved to that effect, but the motion was defeated. A suggestion was made that the committee should consider whether it would not be better to have the offices of architect and clerk of works conjoined, and upon that point a long conversation ensued. In the course of the talk several members thought that the doubling of Mr. Langland's salary—thus raising it from £30 to £60—would be a very fair increase, having regard to the many advantages he had received in the past at the hands of the Board. Ultimately it was decided, by 5 to 2, to recommend that Mr. Langland's salary be advanced from £30 to £100.

EDINBURGH.—A new pulpit of marble and alabaster has just been erected in St. Cuthbert's Church, Edinburgh. It stands on four columns of the choice red marble of St. Ambrosia, Verona, with bases and carved capitals of Italian alabaster. The front panel bears a representation of the Angel of the Everlasting Gospel. The other panels of the pulpit and balustrade are inlaid with Verde Antico marble from the ancient Thessalian quarries, which have not been worked since the time of Justinian till the blocks were taken out a few months ago from which the panels were cut. The work has been executed by Messrs. Farmer and Brindley, London.

GLASGOW.—The People's Palace and Winter Garden situated in Glasgow Green, which has just been opened, has a northward frontage to Monteith Row, and is in appearance, as well as in purpose, of a composite character. The front part of the building, constructed of Dumfries red stone, is utilised as a museum and picture gallery, and has direct communication with the adjacent winter garden, which is constructed of iron and glass, and is of such spacious dimensions as will make it conveniently available for assemblages of the citizens for musical performances and other purposes. The front building has been designed in the style of the late French Renaissance.

KING'S HEATH.—A new Wesleyan chapel has been erected at the junction of School Road and Valentine Road, King's Heath. It is 80ft. long by 49ft. wide internally, and 42ft. high to the top of the ridge. It is divided into nave and aisles by three wide arches on each side, supported by quatrefoil-shaped polished red Aberdeen granite piers, having doulting stone caps and bases. The chancel floor is laid with encaustic tiles, and a high dado of ornamental glazed tiles covers the lower parts of the walls. The east wall of the chancel has a fine five-light window, with a twelve-light "wheel" in its upper part. The gallery extends over the lobbies and the central vestibule, and its entrance and staircase are marked in the design by a tower and spire, the top being 120ft. above the ground. The architect is Mr. William Hale, of Colmore Row, who has based his design on the Early English period of Gothic Architecture, adapting it to the red terra-cotta and brick used generally in the exterior, and also in the interior dressings of windows, arches, and doorways. The cost

of carrying out the works, inclusive of school alterations, will be somewhat less than £6000.

KIRRIEMUIR.—A new baptismal font has been placed in the parish church, Kirriemuir. It has been erected in Caen stone from a design by Mr. Alexander Johnston, architect, Dundee. The design is in the Early English style, and shows a deeply-moulded octagonal base with centre column and four smaller shafts of Victoria red marble grouped at right angles, supporting a foliated carved capital, on which rests the bowl, which is circular in form, and has a richly-carved leaf ornament on the face. The bowl is finished on the top with a silver-plated basin to hold the water. The font has been erected by Mr. Alexander Neilson, sculptor, Dundee.

LEEDS.—About £14,000 is being spent on the rebuilding of Oxford Place Wesleyan Chapel and Sunday School. The front and one side of the old chapel have been taken down and replaced by more attractive elevations. The old Sunday school has been demolished, and the new school will be ready for occupation about May. After the opening of the school, the chapel will be closed for interior alterations. Mr. G. F. Danby, of Great George Street, and Mr. W. H. Thorpe, of Albion Street, are the joint architects. In the course of a year or two it is intended to build a Synod Hall adjoining the chapel. The architects have already prepared plans for such a building, their design showing a handsome tower. This scheme is estimated at £5000. A new chapel connected with the Woodhouse Moor Circuit is being built in Cardigan Lane, Burley. The estimated cost is £5500. The architect is Mr. G. F. Danby. From designs by the same architect, another chapel is being erected in Ladypit Lane, Helbeck. The cost will be about £1100.

MIDDLESBOROUGH.—The new Sunday Schools and Assembly Hall adjoining the Trinity Presbyterian Church stands at the corner of Corporation Road and Elm Street. The entrance hall is 26ft. by 8ft., and from it runs a cement concrete staircase to the first floor. On the ground floor, which is 15ft. high, there is a large room 55ft. by 26ft., which can be divided into three class-rooms by sliding partitions, two of the class-rooms being 26ft. by 18ft., and the third 31ft. by 18ft. From Elm Street access is given to a room 31ft. by 17ft., and then to a second room about 18ft. square. A staircase leads from this room to the retiring room behind the hall, and there is also a cloak-room 11ft. by 8ft., and ample lavatory accommodation. The splendid hall is 55ft. by 27ft., with platform at the end measuring 22ft. by 18ft. The hall has an open timber roof and is 14ft. high at eaves and 24ft. high to ceiling. The retiring rooms behind the hall are 31ft. 6in. by 18ft., with open fireplaces. The ground floor rooms have a wood dado 5ft. high, and the first floor 4ft. 3in. The whole of the wood-work throughout the building has been painted and varnished. The rooms and the hall are all well lighted by lofty windows, some glazed with cathedral tinted leaded lights. Viewed from Corporation Road the exterior of the building is faced with Normanby first quality red bricks, relieved with stone dressings, whilst in Elm Street, Linthorpe pressed bricks have been used with Normanby brick arches and stone dressings. Throughout the building the upper portion of the windows open for ventilation, and two large Boyles self-acting ventilators have been fixed to the ridge of the roof with shafts to same from ornamental pierced ventilators in the ceiling. Mr. Walter G. Roberts is the architect, and the whole of the work has been carried out under his supervision by Messrs. Perks and Son, Stockton, who have had the full contract.

WESTON-SUPER-MARE.—In a limited competition, for a new Wesleyan chapel, to be built at Weston-super-Mare, the design of Mr. W. J. Morley, F.R.I.B.A., of Bradford, was accepted. The building is designed in the decorative Gothic style, with tower and spire, and will cost about £5000.

Under Discussion.

THE WINTER SESSION.

ELECTRIC LIGHT.

Before the Glasgow Architectural Association—the president, Mr. W. T. Conner, in the chair—Mr. Wm. Brooks Sayers delivered a lecture, entitled "Electric Light, Heat, and Power—their Efficient Installation and Cost." The lecturer opened his subject by drawing a picture of what electricity could do to lighten the burden of existence. With electric light, heat, and power we would have no smoke, filth, or suffocating fogs, thus leaving everything fresh and clean without and within; we could pave our streets with asphalt, over which the rubber-tired motor vehicles would skim noiselessly. A descent, however, to the practical showed that much progress had yet to be made, which Mr. Sayers demonstrated in a clear and simple manner by tables and figures, comparing the cost of electricity, gas, and water, supplemented by a description of the different systems and apparatus for electric lighting, illustrated by examples.

COMPETITIONS AT EDINBURGH.

The first meeting of the session in connection with the Edinburgh Architectural Society was held on the evening of Wednesday, Feb. 2. Mr. W. N. Cumming, the president, occupied the chair. After the usual business had been transacted, the awards in the various prize competitions held during the past session were announced. These were as follows:—Hon. president's prizes for "a design for a branch free library, museum and picture gallery"—first, Mr. W. A. Mellon; second, Mr. W. Fairbairn; president's prize "for six sheets of measured work," Mr. J. H. Rutherford; vice-president's prize for "design for reredos and altar frontal for a country church," Mr. P. E. Nobbs. Mr. Cumming announced that Mr. John Kinross had consented to accept the hon. presidency, and then proceeded to sketch briefly the work proposed to be undertaken by the Society during the session upon which it had entered.

DETERIORATION OF ENGLISH ARCHITECTURE.

The annual dinner of the York Architectural Society was held recently, Mr. George Benson, president, in the chair.—Mr. George Corson, president of the Leeds Society, proposed "The York Architectural Society." He said provincial societies had been the product of the last twenty years, and he thought that it was a very good move to introduce them. They had no doubt followed the example of the engineers and the working men in forming unions up and down the country, and it was well that they should look after their own interests from a pecuniary point of view.—The President, in response, said that Society was instituted sixteen years ago. It was their privilege to live in a city where the spirit of the ecclesiastical, civil, military, and domestic life of the past found material expression in the buildings around them. Each of those buildings showed that the men of the past were able to produce some very good work. Their picturesqueness, peculiar outlines, the use of the timber in the natural form, all combined to make a picture in the streets for every passer-by to gaze upon and to think about. He regretted that it was felt necessary to sacrifice the old gateway at the entrance of College Street for public improvements, for it was the only remaining gateway of the walled-in Minster close.—Mr. A. Pollard proposed "The Royal Institute of British Architects." He said that they did not expect that the Royal Institute would become an educational institute, but from its close contact with similar societies in London they might be able to introduce or bring forward a scheme whereby the prominent members of the Institute might be induced to come into the provinces to give them the benefit of their experience.

—Mr. W. Emerson, hon. sec., responded. It had never been the idea of the Institute to become an educational body. That was more than they could possibly entertain. Their object was to attend first to the professional interest of their Profession at large. Their action in matters of that sort was strengthened by the alliance of the provincial societies, but the Institute had always the idea of becoming an examining body, and that during the past year had been fairly well accomplished, and the examinations were now held regularly. He went on to say that he had been much struck lately with the deterioration in English Architecture. Why was this deterioration, and why was the difference between the buildings erected and the drawings shown? Was it because they were anxious to make pretty drawings to win competitions and please their clients, or was there a decay of good taste? If so, why was it? Was it because of the decadence of the nation? It had set him thinking that in ancient Greece, in its later years, it arrived at the Corinthian style, and made its buildings very elaborate, but exceedingly beautiful. This only happened when the nation was going in for a course of luxury, and shortly after the nation was wiped out. The Roman nation began with severe but beautiful buildings. Towards the later period, when they came to the composite order of Architecture, with its elaborate decoration and workmanship, they were in the most luxurious and vicious state of society the world had seen. From that period he supposed that they could say with truth they began to decline and fall. The Mahomedan Architecture culminated in the Alhambra, a gorgeous piece of work, but not to be compared with the early work in Egypt and North Africa, and shortly after that time they gradually wasted away in power. After the time of Henry VII. the English nation went through the fiery trial of the Reformation, and since then we had certainly a simpler style of Architecture, but during the last twenty or thirty years we seemed to be falling away, we seemed to be coming vicious, and Architecture had gone mad. Was it that the nation was on its wane and the taste was becoming vulgar? Did it mean that we had to become purged by the great war they heard of? He had great faith in the British nation, and if they did have a great war would they come out purified as a nation, and purified in taste with regard to Architecture?

REFUSE DESTRUCTION BY FIRE.

At a recent meeting of the members of the Yorkshire Branch of the Sanitary Inspectors' Association, held at Leeds, Mr. George Darley, superintendent of the Leeds Scavenging Department, read a paper on "The Destruction of Towns' Refuse by Fire." Destructors, he remarked, had been in use at Leeds for twenty years. There were at the present time four, capable of consuming 80,000 tons of refuse per annum. The temperature obtained was from 1200 to 1500 degrees Fahr. Mr. Darley affirmed that it would not be at all satisfactory to work a destructor without some means of obtaining the highest possible temperature, either by steam jets or fans. He also added that the cost of dealing with a ton of refuse in Leeds was about 1s. 6d.—During the discussion, Mr. Drake said that a large amount of the Huddersfield refuse was disposed of by means of tips, and, as greater care was now taken in regard to the tipping, there were fewer complaints than had previously been the case.—Mr. Denham expressed the hope that small destructors, costing £30 or £40, would be made, so that in colliery villages the refuse from the pits might be got rid of.—Mr. Travis (Halifax) said that Halifax was very well situated in regard to tipping places. His experience was that even those authorities which had destructors tipped their ashes when they had the chance to do so, in order to save the shilling a ton which it cost to burn the refuse.—The Hon. Secretary expressed the opinion that all tipping of refuse ought to be severely condemned, as a source of great danger to present generations and those which were yet to come.

Enquiry Department.

NOTICE.

Readers manifest a desire from time to time to assist those who avail themselves of the Enquiry Department instituted in this Journal, and many supplementary replies answering points raised in the Enquiry Department have been received from all quarters. The Editors, therefore, have decided, in order that Enquirers may benefit also by these kind offices, to publish the supplementary answers, in addition to the answers supplied by the technical experts associated with the staff of the Enquiry Department. The more widespread the information, the more effectually will the purposes of the Enquiry Department be served, and the Editors invite replies from any to whom the questions appeal, as they appear. Such answers must be to hand not later than Saturday morning for the forthcoming Wednesday's issue.

THE ROYAL ACADEMY SCHOOLS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Can you, or any of your readers, give me some information as to the steps to be taken to gain admittance to the Royal Academy Schools as an architectural student; and is there an age limit?—Yours faithfully,

STUDENT.

The best thing is to write to the secretary of the Royal Academy at Burlington House, who will supply you with a pamphlet giving you all the information you require. The age limit is twenty-three.

SUBSTITUTE FOR SAND IN MORTAR.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Through the medium of your columns in the BUILDERS' JOURNAL, I should esteem the favour of information on the following matter, viz.:—Would it be detrimental, or otherwise, for the making of good mortar (milled) to utilize the chippings and dust of Bath stone, as accumulated from stonemason's shed, as a part substitute for clean sharp sand, the proportion being $1\frac{1}{2}$ of sand, 1 of stone dust and chippings, and 1 of ground lias lime? Thanking you in anticipation of a reply, I am, Sir, yours faithfully,

"KENTISH RAG."

The chippings of Bath stone may be used with considerable advantage as a substitute for sharp sand, to the ultimate strength of the mortar, if they are carefully milled previously, but the dust, if very fine, should be sparingly introduced, or it will prevent the setting.

CONVERSION AND SEASONING OF TIMBER.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Some oaks, for the supply of the timber for the construction of a roof, are to be felled. What is the best way to form a fairly accurate estimate of the number of trees that would be required? There are seven large tie-beams for which the trees would have to be specially selected. Would it be necessary to cut down one or two extra trees for contingencies? How long will the timber take to become thoroughly seasoned?—Yours faithfully,

F. E.

It is very difficult to determine without experience obtained on the particular plantation how much serviceable timber may be expected from a standing tree. To approximate it take the smallest dimension with callipers, describe a circle of that diameter, within it

draw two transverse diameters, set off upon them points, 2in. within the circle, as allowance for sapwood, &c.; lines joining these points will give the sides of the largest baulk to be obtained. Select the largest and straightest trees for the tie beams, and cut on each side of the heart tangential to the annual rings, the slabs will convert into rafters, &c. It will be advisable to cut a few extra, as faults may be discovered during conversion. It is almost too late to fell this winter. October to December is the best time, there is then much less sap to get rid of. To become thoroughly seasoned two to three years will be required, but it will be fairly dry for roofing purposes, in twelve months if barked immediately on felling and stacked in open order well clear of the ground and protected from the sun and rain.

HALF-TIMBERED WORK.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I should be glad if any of your readers can inform me as to the best method to treat the oak timbers in a half-timbered building. Some I have seen are painted a dark colour, while others are either slightly stained, or oiled, and show the grain of the oak. I shall be much obliged by some particulars on the subject of this latter method of treatment. Also, is the effect of keeping back the cement $\frac{1}{2}$ in. from the face of the timbers considered to be better than, say, that of $\frac{1}{2}$ in.?—Yours faithfully,

CONSTANT READER.

Pine and larch timbers are usually painted; oak and teak more often left plain, varnished, or oiled, and sometimes covered with two coats of Carbolineum Avenarius, this turns it a light brown and acts as a preservative, but dries dull. If oiling is preferred use boiled linseed oil applied with a brush, stained, if desired, with burnt umber—experiment upon a piece for the right tint—or the wood may be previously stained with spirits of ammonia (fuming). The deeper sinking of the cement panelling referred to would doubtless be the more effective in appearance, but would tend to earlier decay. Odd work will be found almost invariably flush. If the cement is kept back the exposed upper edges of the timbers should be weathered.

DRAINING BASEMENTS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—It is proposed to deepen a basement, lowering the present floor about 2ft. 6in. The drain is only about 6in. below the present floor line, and the water is standing in the soil at the level of the drain. I should be glad to have suggestions from persons who have had experience in similar work as to the best method of procedure in order to insure a thoroughly dry basement. It is not possible to alter the level of the drainage.—Yours, &c.,

ENQUIRER.

If it is not possible to alter level of present drain, the most economical method of draining the site will be to sink a sump pit at the lowest part and several feet below the intended floor, to collect the ground water, to be removed by pumping. Cover the ground with a 12in. layer of concrete, and build the walls in cement. This has proved successful in several instances in London.

A STAINED-GLASS window has been placed at the east end of Silk Willoughby Church, near Sleaford. It has been designed and executed by Mr. C. Whall at a cost of £300.

An enquiry has been held at the Burnley Town Hall relative to an application by the Corporation to borrow £25,000 for electric lighting, and £1700 for police stations.

The Secretary of State for Foreign Affairs has been informed by Her Majesty's Ambassador at Rome that tenders are invited by the Italian Government for the erection of certain public works in the harbour of Brindisi. Particulars as to the terms and notice for tenders may be inspected at the Commercial Department of the Foreign Office any day, between the hours of eleven and five.

IMPORTANT NOTICE

TO

Subscribers and Advertisers.

ADDITIONAL PUBLISHERS.

In order to cope with the widely-increasing circulations of "The Builders' Journal," and of "The Architectural Review," and

"The Field," and "The Law Times," will act as additional Publishers to "The Builders' Journal," "The Architectural Review," and "Specification."

Therefore the three publications will henceforth be issued from Effingham House, Arundel Street, Strand, as heretofore, and from the Offices of "The Queen," "The Field," and "The Law Times," Bream's Buildings, Chancery Lane, London, E.C.

The wide publishing connection of the firm of Mr. Horace Cox will enable New Subscribers throughout the country to receive their copies of the three publications with the utmost rapidity.

teets who have been more than usually successful. One hesitates, however, to make this last statement without a little qualification. It would be absurd, for instance, to expect a very successful competition architect to advise his younger brethren to go and do likewise. He would add as a rider that it was a terribly anxious and trying time, instead—as the young man generally finds—a most fascinating, if tantalising, one. The young architect—that is, he who is young in years—will nearly always find something to say in favour of competitions, except upon those two or three days—recurring from time to time—after his unsuccessful ventures, which is but a very natural reaction from nights spent in hopeful anticipation of success. It is possible to forgive the hard words he will then use against competitions, assessor's committees, and conditions; it is a passing spasm—a sudden rage that seizes him against the things life offers. He asks for a golden apple, and is presented instead with a curt and cold letter, stating that the committee regret, etc., etc. All this is exasperating to hopeful youth, who, previous to the

"THE HOUSING OF THE DRAMA." THEATRE DE L'OPERA, PARIS.

in view also of the extraordinarily large demand for "Specification" (quarterly), now published, the Proprietors of "The Builders' Journal," "The Architectural Review," and "Specification" beg to announce that they have entered into arrangements whereby their Printers will undertake joint publication.

In future the firm of Mr. Horace Cox, who are the Proprietors of "The Queen,"

Competitions and Competitors.

MUCH has been written upon the evils which accompany public architectural competitions—in other words, the choosing of the architect or architects to whom some proposed building shall be entrusted for its proper carrying out. A literature upon the subject awaits the disinterested inquirer who can bring himself to the arduous task of sifting the evidence for and against competitions. The valuable evidence in favour of competitions would probably come from the youthful portion of the architectural community, and possibly some might be forthcoming from the archi-

result of the competition, had been working down the avenue of life in a flood of sunshine; it has not as yet occurred to him that there is possibly a maggot in the golden apple he asks for. It is well that it hasn't, or the building papers would be strewn even more than they are at the present day with letters from "A Disappointed Competitor," "An Impartial Outsider," "One who Knows," and "One who Intended to Compete." Young hopeful, however, is fairly sane; he seldom indulges like his envious elders in that interesting occupation of endeavouring to explain why the first premiated should be disqualified, nor does he complain of the committee, the assessors and the conditions but in that

general and abusive way already mentioned. It is unfortunately those who have won two or three competitions who write to the building papers under curious nom de plumes—success seems to give them a distorted idea of their abilities. To win once, twice, or even thrice, works them up into an unenviable condition of mind, a frame of mind that argues that there must be a screw loose in the settlement of the award when a competitor who has already won thrice is entirely ignored. He may find that the spirit rather than the letter of the conditions has been adhered to by the winning set of drawings. Then follows, alas! a letter from "One Not Interested." It is appalling, when anyone thinks it over, the number of individuals who write to the building papers having not any interest in the award. It may be laid down as a general rule that, whatever may be the result of a competition disinterested philanthropists are on the increase at these times.

G. LL. M.

Saved from the Despoiler.

So the Crystal Palace is to be preserved. The very real danger—amounting almost to certainty, we were told—which existed a few weeks ago, that unless the Palace was either purchased or subsidised it would be razed to the ground, and the site whereon it stands inherited by the suburban builder, has now been removed. Negotiations for the purchase of the Palace have been carried so far that the safety of the great structure, with the beautiful grounds is definitely announced. The well-known schools of engineering, Art, and music, which since the foundation of the Palace have formed not the least important and successful features of the institution, will, we are told, be maintained, and the abundant facilities of tuition they have afforded, be extended. The Art treasures at the Crystal Palace will, of course, remain, and though the demolition of the huge building could scarcely be mourned as the loss of a great triumph in Architecture, it is eminently satisfactory that it has escaped its threatened doom. Whatever the Crystal Palace is not, architecturally, it still is a monument of engineering skill, not without grandeur, an important art centre, and withal a useful and convenient building. "Nowhere in England is there such a fine collection of casts from foreign antiques, many of them the only casts ever taken, and of curious mediæval monuments, artistic and architectural. Some of these, spread about the dim and seldom visited side courts, would repay an artist for weeks of study." Thus writes the author of "John Halifax, Gentleman." And it would be a matter of deepest regret if the collection were distributed. On the other hand, may we not hope now that these casts from the antique will be improved and increased, that among other improvements which are to take place, the Palace may be more fully developed as an art centre? The grounds in which the Crystal Palace stands, too, are not to be lightly sacrificed. The situation is one of the finest around London—in fact, only Hampstead Heath is comparable with it. From the grounds of the Palace, spacious and beautiful in themselves, a long vista of fair Surrey opens up, with its blue hills rising away in the background. The suburban builder has of late been viewing the scene prosaically, gleefully anticipating the day when he should hold high revel in putting up rows of "all those desirable and leasehold tenements,"—semi-detached villas. All around the Palace one notices new encroachments by the builder, and it is a relief to know that such a magnificent open space as the Crystal Palace grounds is not yet to be given over to dull and drab suburbanism.

AN ARCHITECT'S EXPERIENCES :

PROFESSIONAL, ARTISTIC, AND THEATRICAL.

By ALFRED DARBYSHIRE, F.S.A., F.R.I.B.A.

IT is rarely that architects give their reminiscences to the world in book form; and when they are moved to do so, it is generally in posthumously published works, and for the vindication of their life work that they are led to become authors. Thus, Sir Gilbert Scott closed his career by such a book, which reads in parts like an apology for the things he did to our cathedrals in an unexampled professional practice in restoration works. But Mr. Darbyshire, who has been in architectural practice in Manchester since 1862, has written a work of more than professional interest. He has known many people in his time whose names are now public property, and his pages contain interesting gossip about them, in between a racy *résumé* of his own career. Mr. Darbyshire comes of a Quaker family. He was born at Salford, by Manchester, in 1839, and was early articled to a firm of Manchester architects, whose two constituent partners, Mr. P. B. Ally and Mr. Richard Lane, provided the somewhat humorous style of *Lane and Ally* to the business undertaking. In 1862 he set up for himself, and early-secured commissions, his first being works at Lyme Hall, near Stockport, in Cheshire. He then entered into a competition for an intended Town Hall at Pendleton, and, although an enthusiastic lover of Gothic, prepared, under the advice of friends, two sets of drawings, one in the style of his choice and another in a Classic style. The result was something of a disappointment from the artistic standpoint, although from the purely professional or commercial point of view it left little to be desired. In point of fact, the Gothic design was rejected, and the Classical one secured the commission. Since that eminently satisfactory result of his first competition, he has won many more, early following up his initial success with the striking achievement, for

A YOUNG PROFESSIONAL MAN,

of securing the first premium in the Municipal Abattoirs' Competition organised by the Corporation of Manchester. That was in 1870, and he not only had the satisfaction of erecting those, among the first public abattoirs in the country, but that also of having his design copied extensively on the Continent and at Cardiff. It is true that only in the latter instance did he receive any fee for the copying of his Manchester design; but there are many professional brethren who have had their works pirated without even one little fee resulting, and so when Mr. Darbyshire laments the lot of the architect, we may take it that here is a successful professional man lamenting the lot, not of himself, but of the weaker brethren.

Mr. Darbyshire early became acquainted with the late Mr. Calvert, of the Prince's Theatre, Manchester, and the acquaintance, which was formed at an amateur performance, resulted eventually in a long series of architectural and decorative works being carried out for that manager, and incidentally to a wide acquaintance being formed with theatrical folk. This extensive acquaintance includes Sir Henry Irving, who, years ago, was a member of the stock company of the T.R., Manchester. Indeed, Sir Henry is one of Mr. Darbyshire's most intimate friends. When the actor opened his management at the Lyceum Theatre, in London, in the beginning of 1879, it was Mr. Darbyshire who redecorated the house for him. He has a diverting anecdote on page 237 of a manager's

"An Architect's Experiences: Professional, Artistic and Theatrical." By Alfred Darbyshire, F.S.A., F.R.I.B.A. Published by J. E. Cornish, Manchester.

difficulties, in connection with Sir Henry Irving's production of "Faust."

Indeed, the theatrical experiences of this versatile architect are many and varied. Prominent in his professional practice are the re-casting of the Prince's Theatre, Manchester, the building of the Comedy Theatre in the same city, and the building of a new theatre at Exeter, to take the place of the one burned down with so fearful a loss of life some twelve years since. This last he planned in consultation with Sir Henry Irving, on what was known as the "Irving-Darbyshire Safety Plan."

Fired as a boy with a love of Art, by a visit to the Great Exhibition of 1851, and by the Art Treasures Exhibition of 1857 at Manchester, Mr. Darbyshire has always treasured a love for the beautiful, and has known more or less intimately the leading artists of the mid-Victorian era. He has an interesting story to tell of G. D. Leslie, Fred Walker, J. P. Hodgson, and H. Stacey Marks, who were staying at Sir William Agnew's house, "Summer Hill," Pendleton.

In the Manchester Exhibition of 1887 Mr. Darbyshire executed in

THE WELL-REMEMBERED REPLICA

of "Old Manchester and Salford" which contributed to the success of that show so very greatly, nearly £1500 having been taken in coppers from the visitors for the privilege of ascending the reproduction of the old parish church tower of Manchester. Exhibitions are not invariably commercial successes, and although they may be visited by huge crowds, the immense sums incurred in management soon take away profits, as guarantees know to their cost. Although the Great Exhibition of 1851 was visited by over six million persons, the net profits only reached £186,000. The gross receipts were £515,000, the expenses £332,000. The succeeding Exhibition of 1862 was visited by more than 6,100,000 persons, but the expenses were so enormous that no available surplus remained; while at the end of 1874 it was discovered that while the visitors in the four years amounted to 2,750,000, the net loss was £14,000. In view of these figures for London, Manchester did very well with a "handsome surplus."

With this we must leave a book which brightly reflects the catholic sympathies of a cheery architect and man of the world.

C. G. H.

NEW ROYAL ACADEMICIANS.

AT the Royal Academy on Wednesday week Mr. Benjamin Williams Leader and Mr. John Seymour Lucas were selected as Academicians, and Mr. Charles Napier Hemy as Associate. The many admirers of Mr. B. W. Leader's pictures will rejoice in the honour that has been conferred upon him. The new R.A., who will shortly enter his 67th year, is essentially a popular painter of popular subjects. His first picture—"Cottage Children Blowing Bubbles"—was exhibited so long ago as 1854, and brought him £50. He was elected an A.R.A. in 1883, and his honours include a gold medal from the Paris Exhibition of 1889, and the decoration of a Chevalier of the Legion of Honour. The other new Royal Academician—Mr. J. S. Lucas—has not yet completed his 50th year. Just as Mr. Leader has given most attention to mountain scenery and rural subjects, so Mr. Lucas has sought his studies in the domain of history. Probably his most notable achievements are his pictures portraying the "Surrender of Don Pedro de Valdez to Drake on board the 'Revenge,'" "Peter the Great at Deptford," and "The Call to Arms." Mr. Lucas became an Associate in 1886. His works have won him considerable popularity abroad. Mr. C. Napier Henry, the new Associate, has long been recognised as a distinguished marine painter, and "Pilchards," his picture at the last Academy Exhibition, was considered of sufficient merit to secure the distinction now conferred upon him.

THE HOUSING OF THE DRAMA.*

WITH SPECIAL REFERENCE TO SUBSCRIPTION AND ENDOWED THEATRES.

BY EDWIN O. SACHS.

Author of "Modern Opera Houses and Theatres," &c.

(Continued from page 6.)

HAVING indicated what spirit prevails for the original conception of Municipal and Subscription and Endowed theatres on the one hand, and Court and Government theatres on the other, let me briefly recapitulate and say that the Municipal theatre is intended to provide such suitable housing for the Drama as can be afforded by the community; the Subscription or Endowed theatres to the extent of the provision which can be offered by its donors; while Court and Government theatres

footsteps were often little else than mere imitators, void of the true intelligent feeling which is the characteristic of their master. To narrate an anecdote which illustrates how the true feeling for the suitable "Housing of the Drama" can also be misinterpreted. A certain actor-manager, so the late Mr. Phipps told me, going to the extreme, wished his vestibule to have a sacred appearance. "We should feel inclined to fall on our knees when we approach this shrine of the Drama," so said that manager. It is true that this actor-manager changed his mind afterwards, and wished to have his vestibule majestic. "Plenty of red, gold, and marble," he said; "we should be inspired by the awe of the Drama and its majestic power." Well, he changed his mind again, he thought of the Drama in its homeliest spirit, as the friend of the tired mortal, and that vestibule was to entice the wanderer into homely surroundings. So you see how this actor-manager successively misinterpreted the requirements of a theatre, though well-intentioned, and, as architects, you will, I am sure, pity the *confrère* who was instructed to

also a genuine interest in architectural work, with the result that the play finds a worthy home amid appropriate and dignified surroundings.

Now I have frequently said that the London playhouse is generally placed in the hands of architects who are merely good planners, good constructors, and business men, with a qualification of being able to provide for a maximum audience at a minimum outlay. With but few exceptions, it is of little importance if the so-called theatrical architect has the true feeling of Art, if he can only secure the latest trick of the plaster manufacturer to catch popular taste. What counts more than any repute for architectural design is that the architect should have the talents and facilities of a financial agent, and be able to find money for the enterprise. Why, the late Mr. Phipps told me (and I had a great admiration for Mr. Phipps' powers of designing) that he would have frightened away his clients if he spoke of Architecture with a big "A." They would have thought him expensive, a faddist, or anything else but what they wanted. He purposely

"THE HOUSING OF THE DRAMA." SUBSCRIPTION THEATRE AT STRATFORD-ON-AVON.

are erected in a manner commensurate with the larger financial resources of the individual Government or monarch, irrespective of what is due to dramatic art. With the private theatre, I would here remind you that we found the "Housing of the Drama" to be simply a question of £ s. d. In the private theatre we have only a problem of economy to solve, and the only regard that has to be given to the architectural rendering is whether the individual holder or lessee considers that his audience requires a little more York stone, Art in its best meaning, a semblance of Art, or the gaudy treatment of an advertisement. I am glad to say that we have a few actors and managers who, though risking their money, have thought of the suitable "Housing of the Drama," independently of the absolute restrictions of £ s. d. Take Mr. Darbyshire's charming record of his architectural experiences, and we very soon recognise the spirit in which Sir Henry Irving first put the old Lyceum in order in 1878. But Sir Henry Irving has been the exception, and those who followed in his

solve the three problems in turn, and then a combination of all three. I may as well say that the architect did not solve the problem. And if you wish to enjoy the beautiful plays which are presented at the theatre I am referring to, mind you go in by the pit door, or the stage door, or a window if no door is available, but do not venture through that sacred, majestic, and homely vestibule, otherwise it will spoil your evening. But it is not often that we have such an employer as Sir Henry Irving, nor even the species of actor-manager whose vestibule I have just referred to. As a rule, we have to deal with men to whom the appearance of the playhouse is a matter of minor importance as long as there is the customary supply of velvet and gilding in the auditorium. And they are quite right, for with few exceptions the London manager and his provincial colleague have only to cater for the pleasure of a sensation-seeker practically devoid of any feeling for Architecture, and with little reverence for dramatic art. The British public cares very little for Architecture, and the Drama is merely classed as an entertainment. It is otherwise outside our isles. With a genuine reverence for dramatic art, there is

avoided trying even to make his façades or decorations presentable for fear of, being thought an Art architect and losing his theatrical *clientèle*. Of the many private playhouses that he designed, and I think I know them all, Her Majesty's Theatre is the only one where there has been any serious attempt made at Architecture, and this is mainly due to Mr. Tree having indicated that he wished to have something above the commonplace. Of private theatres by other so-called "theatrical architects," I regret that I do not know of any that can boast of architectural pretensions. At present, the only theatre that deserves serious attention on account of its rendering is quite a small one at Cambridge, which, in spite of most unsuitable surroundings, has a charming interior. This is the work of Mr. Rüntz, who does not figure as a "distinguished theatrical architect," but who, among other important commissions, holds several for playhouses. His new playhouse at Peckham promises to show an architectural rendering of a higher order. He is bold enough to risk losing his theatrical client by giving us a building of some importance. Mr. Darbyshire, by-the-bye, has

* A paper read before the Royal Institute of British Architects on February 7th.

"THE HOUSING OF THE DRAMA." MUNICIPAL THEATRE, ODESSA.

conceived some excellent plans on true Art lines in connection with the Variety Theatre, which we must not, however, refer to when speaking of the Drama; Messrs. Colcutt, D'Oyly Carte and Holloway, similarly did excellent work at what is now the Palace Theatres of Varieties. But as far as the Drama is concerned, the architectural rendering, as a rule, is quite nondescript.

Now abroad the architect of a playhouse has to be an architect in the very highest sense of the term, and very rightly so, too. Where a municipal monument, the gift of a subscriber, or a Court or Government theatre has to be dealt with on the lines indicated, it is only natural that every effort should be made to obtain a good building; and even in the private theatre, as will be seen from the "New" Theatre at Berlin, the necessity for catering for people who take interest in Architecture and respect the Drama compels the architect to be something more than a mere constructor. Why the building of a suitable home for the Drama is one of the most difficult tasks that an architect can undertake, and calls for a man endowed with a pure and true spirit of the architectural vocation. His work demands the largest share of real beauty, and the most careful blending of Architecture, sculpture, and painting, whilst the complicated practical requirements are at the same time hostile to all his efforts at perfection in design. There is, in fact, no class of architectural work which puts forward more numerous, complex, and essentially technical demands, and requires at the same time that the rendering shall not fall below the highest standard of taste than that of the theatre.

But now let us look at examples of playhouses erected under the different circumstances I have indicated. We will commence with the private theatre. But let us simply pass over the eyesores which have been erected in such numbers, and only take the very pick of what we have in private theatres in the Metropolis. Now there is no doubt that, speaking of the West End, the most recent playhouse, Her Majesty's, in the Haymarket, just referred to, is far and away the best example of recent theatre Architecture, both in plan and in architectural rendering; and this is due, as I have said, to a great extent, to the liberal spirit of the lessee, and also to the peculiar facilities of the site. In Her Majesty's Theatre, the late Mr. Phipps surpassed all his former efforts, and furnished London with a playhouse so admirable in the arrangement that it will long be considered a model of its kind. And yet, no one who does not recognise the posters and the lighting would point out this building as a home of the Drama. Its exterior, excepting for its many doors, would be just as suitable for a suite of modern flats or a hotel. And in the interior,

features, but few are characteristic of a playhouse; nor does the decoration show breadth of design. All that the practical planner could have done has been done in this building to fulfil the requirements of the management, with due regard to economy; but that is the greatest praise we can give it, and in that respect alone it is a model. To a certain extent you could almost say the same of Daly's Theatre in Cranbourne Street, which has many advantages of plan, construction, and equipment; but again, it can surely not be considered as a suitable home for a revered Art. Her Majesty's Theatre stands head and shoulders above the other West End playhouses. Daly's comes next, then follow a certain number of playhouses which are somewhat above the average, like the Duke of York's Theatre, the Shaftesbury, and the Lyric; but surely none of these can in any way be confused with what we would term a suitable home for the Drama. If we glance round the suburban theatres, we find a similar state of affairs. No doubt we have many theatres practically planned, but one building alone is likely to stand out among its contemporaries, and that one, which, as I have already indicated, is yet in course of construction, is the Peckham Theatre, designed by Mr. Runtz. It is, as I have pointed out, a theatre by the same architect which stands out far above the average provincial playhouse. I am speaking of the small example at Cambridge, known as the New Theatre. The Wolverhampton Theatre of the late Mr. Phipps comes next, and though of broad conception in plan, I am afraid his architectural rendering makes it a bad second.

After these examples of our private theatres, let us turn to the Continental playhouses, which are built under almost identical conditions, i.e., those of a financial enterprise, with the one exception that the general public demand that the play should be suitably housed with some regard for Architecture. No doubt financial reasons here also compel the architect to limit his expenditure in the architectural rendering; but in conception, in outline, and in planning some of these buildings take a very high position, and even in their architectural treatment merit considerable attention. The New Theatre at Berlin, which only seats an audience of 800, is a good instance of a playhouse which has been placed on an awkward site, and yet in every way accords with the requirements of the Drama. The Lessing Theatre, in the same city, is another instance, and so is the New Theatre at Munich. Other instances can be cited, but as I have only selected the best examples of metropolitan and provincial theatres in England, so do I limit myself to naming a few examples of the first order from the Continent. Everywhere, however, both in England, where we have no demand for good

Architecture, and no reverence for the Drama, and on the Continent, where both demand and reverence exist, it is evident in the case of the private institution that the architect is cramped, and this even where the excellence of his intentions is obvious. In the rendering of a private theatre it seems impossible to give the building the full dignity it deserves with the limited funds of private enterprise.

Let us now turn to examples of Municipal, Subscription and Endowed theatres, irrespective of their actual origin by gift, the subscription of ratepayers, or otherwise, and independent, also, of the fact that the theatre may or may not be used sometimes for the presentation of opera and other forms of entertainment. To begin with, we have at Stratford-on-Avon what I will term a "Subscription" theatre, which in every way accords with the special requirements of being a monument to a great poet, and a home for the Drama with which he was associated. It is true that even here the funds were not lavish, but there were none of the cares of a private enterprise, and none of the usual difficulties of site. The £20,000 spent on this memorial may seem a small figure, but it amply sufficed to cover the requirements, and give accommodation to the small audience for which it is intended. A visit to this theatre is most pleasant, both for the admirers of the Drama and for the architect, and for once we find that every possible care has been taken to invest a building with due dignity, and with due regard to its association. Now on the same basis we find many interesting playhouses abroad. There has been no question of cramping the site and the design to suit the exigencies of commercial enterprise. The endeavour has been to provide the locality with a suitable home for the Drama, and at the same time to erect a monument which shall become the pride of the community to which it belongs. Take Heinrich Seeling's three Municipal theatres at Hallé, Bromberg, and Rostock — towns with small populations. Consider the sites and the general conception. Then look at the small Municipal theatres of Salzburg in Austria, erected by Messrs. Fellner and Helmer; or their Municipal theatre at Zurich, or any other of the Municipal, Subscription, or Endowed theatres. Remember, too, the beautiful monuments, such as the Amsterdam Subscription Theatre, with regard to which I should, however, emphasise that it is devoted alike to opera and drama; the Prague Theatre, and among others, going as far south as Palermo in Italy, or as far east as Nishni-Novgorod and Tiflis in Russia, or stepping over the boundary and going to that "barbarous" country of Siberia, we find that even Irkutsk has also its beautiful municipal establishment, which in every way accords with the dignity of the Drama.

(To be continued.)

London Street Architecture.

By H. W. BREWER.

SOME of the inhabitants of Stratford Place, and all those who are interested in the street architecture of London, must regret to hear, writes Mr. H. W. Brewer in the *Daily Graphic*, that there is a proposal to break through the classical outlines of the place by heightening one of the houses, an operation which will destroy, it is said, its symmetrical treatment, and will establish a precedent which will completely abolish its architectural character.

STRATFORD PLACE

consists of a short street which runs out of Oxford Street northward, and terminates in a square court, the north side of which is occupied by a mansion, which certainly presents one of the handsomest classical façades in London. The whole was erected at the expense of Edward Stratford, second Lord Aldborough, in the year 1775, from the design of the celebrated Adam Brothers. What is very remarkable about it is this—that the street, square, and mansion at the end of it are all incorporated in one design in such a way that the façade of the mansion forms a centre of the composition, and the sides of the street wings at right angles to it: connecting the façade with its wings are colonnades. The sides of the houses which abut upon Oxford Street are adorned with pilasters, and two square projections, like gate-posts, are terminated with stone statues of lions. As originally built, there were probably iron gates and screens at this point, and there was a monument in the centre of the square. When the whole was complete, as it came from the hands of its talented architects, it must certainly have been extremely handsome, and even at the present time it is

ONE OF THE BEST EXAMPLES OF STREET ARCHITECTURE

in the Metropolis. Unfortunately, however, some alterations have been made at various times which have robbed it of a good deal of its character. The monument in the centre of the square was removed in 1802, and the south-east portion of the composition, which faces Oxford Street, has been rebuilt upon a different design, so that the whole symmetry of the Oxford Street approach is lost. The ground-floor stories have been altered; those which were of brick originally have been plastered over, and some which were of stone have been painted. Why on earth, in London,

cannot people be persuaded to follow some general scheme in the colouring of their houses? Why will one man paint his house a bilious butter colour, while his next-door neighbour paints his in imitation of damson jam, and next door but one a sickly green? Although in Stratford Place we do not find all those varieties, yet there is enough and to spare, and they have done a great deal towards breaking up the dignified symmetry of the design. Paint, however, can be scraped off, but the addition of a story to a house which forms a portion of a classical composition is a far more serious matter. The house (or houses) proposed to be heightened form a portion of the side wings, and we leave readers to imagine what the result of such an alteration would be. Of course, "picturesque irregularity" in a street may be interesting and striking.

THE THREE MOST MAGNIFICENT STREETS

in Europe—the Maximilian's Strasse at Augsburg, the great street at Landshut, and the High Street at Oxford—are all thoroughly irregular, but the buildings which border them are of almost colossal dimensions. At Augsburg and Landshut, for instance, there are great towers 360ft. and 420ft. high, and in the former street there are immense fountains with basins 60ft. in diameter. At Oxford, the fronts of the colleges are long enough to give grand architectural character to the thoroughfare which they border, but scarcely any of our London streets are dignified enough to stand an irregular treatment without looking shabby or ill-arranged. Moreover, if the buildings of a street are from the first designed in a symmetrical manner, any additions which do not follow the original scheme are certain to produce a patchwork effect. We see this in Regent Street, which was the best planned thoroughfare in London, but which from carelessly designed additions has lost its regular horizontal sky-line, and is now neither one thing nor the other; in fact, it is rapidly becoming a mere patchwork jumble! As Stratford Place is about the only symmetrically arranged street in London, it is certainly advisable to retain it in its present condition, although individuals may suffer some inconvenience.

THE tower and nave of Acton Church, Nantwich, have just been completely restored at a cost of nearly £5000. The chancel of the church is being restored by Lord Tollemache, and Mr. H. J. Tollemache, M.P., has undertaken to erect an organ-loft at a cost of £600.

WESTMINSTER IMPROVEMENT SCHEME.

FEW residents in this neighbourhood (says Mr. C. W. Furze, writing to the *Times* from 1, Abbey Garden, Westminster,) can have taken interest in the surroundings of the Houses of Parliament and the Abbey without foreseeing great structural improvements. A good beginning has been made, but more must follow. Already one side of Parliament Street is in the hands of the destroyer. A terrible eyesore has been removed from Palace Yard, and Henry VII.'s Chapel and the beautiful Chapter House have been opened out with the happiest effect. The eye moves onward to the south. Speaking for myself, I have for several years predicted the abolition of the present houses in Abingdon Street and the substitution of finer buildings, withdrawn further westward, and more nearly approaching the old fourteenth century wall which incloses the Abbey garden, or, as Old Westminsters still call it, the College garden. This change would give a wider and nobler street running in front of the House of Lords, and a site obviously appropriate for Government or other public offices, such as the County Council may not improbably require. Next in importance to Abingdon Street is Millbank Street. That the patience of Londoners, who value their river, has borne so long this obvious interruption of the Victoria Embankment, the finest improvement in London during the last fifty years, is simply a marvel. But how do the promoters of the new scheme propose to deal with these two streets? Abingdon Street is clearly a site upon which Parliament has the first and, I venture to say, the exclusive claim. Its splendid position, its contiguity to the House of Lords and the Victoria Tower, the opportunity it gives for the creation, not only of dignified and beautiful buildings worthy of their august surroundings, but of offices of paramount importance in satisfying national requirements, seems to me an invincible argument for preventing its sliding into the hands of an irresponsible syndicate. Again, a few years ago, a scheme was put forward by a member of the late Government for building an annexe to the cloisters of the Abbey for the purpose of giving ampler space for the graves and monuments of great men. So far as I know the mind of my colleagues in the Chapter, we have no wish to make any addition to the Abbey, although some of us might wish to transfer to an appropriate spot some questionable masses of marble which now

"THE HOUSING OF THE DRAMA." MUNICIPAL THEATRE, AMSTERDAM.

cumber the ground. But, whatever individuals may desire or deprecate, we are not so short-sighted as to believe that the project is dead. The question, I believe, is only suspended. Mr. Shaw Lefevre's plan of making the extension on the south-east side, in the direction of the Jewell Tower and the north corner of Abingdon Street, is thought by many to be the likeliest, if not the only possible, line such a building could take. Now, is Parliament likely to part with a site, available for such national uses as the two I have indicated, to a number of private gentlemen, however honourable, who must in the nature of things see to dividends and rents in order to recoup themselves and other investors for the expenditure of millions in their speculation? Not only would the nation disfranchise itself of its just prerogative, but, in spite of any stringent conditions, Parliament could not guarantee to London a security from another high and narrow Victoria Street, or another Carlton Hotel and theatre, or a block of vulgar residential flats. Then, passing to Millbank Street, it needs no trained artistic eye to see the certain effect of extending the Victoria Embankment from the south end of the

viduals with the grant of compulsory powers of destruction and construction. The national and metropolitan value of these sites vindicates the unique claim of a responsible Parliament to deal with them. Patriotism and business may be combined; but we may not forget the reasonable distinction drawn by an acute observer of Republican Rome—

*Privatus illis census erat brevis,
Commune magnum.*

Nor is Mr. Justin McCarthy's criticism in his last volume without point in an age of financial speculation, where he says of the "adventurers" who associated themselves with Sir Walter Raleigh:—"There was a good deal of practical genius in some of Raleigh's compatriots and colleagues, and, eager as they were to extend the Empire and the glory of England, they were not unwilling at the same time to make money out of the enterprise."

THE recently-opened Beech Grove Congregational Church at Newcastle-on-Tyne has been built by Mr. G. H. Mauchlen, contractor, from designs by Mr. Stephen Piper, architect, Newcastle.

ARCHITECT'S FEES.

AN INTERESTING LAW CASE.

A DECISION of some importance to architects and surveyors has recently been given by Mr. Charles Barry, of Westminster, in the action of Keats v. Boger and others. The plaintiff, an architect at Plymouth, had acted since 1871 as architect and surveyor of certain estates of very considerable extent in Plymouth, belonging to the trustees of the will of Thomas Bewes, deceased. He also acted in a similar capacity for Admiral Sir Michael Seymour, owner of another large estate in the same town. These estates were intended to be gradually developed and sold for building purposes, and the plaintiff accordingly surveyed, laid out, and sold one portion after another of the estates as the time appeared fitting. Up to 1884, at the suggestion of Sir Michael Seymour and Mr. C. T. Bewes (the then solicitor to both estates), the plaintiff's remuneration was altered to a commission of £5 per cent. on the purchase money of all land sold, such commission covering not only

"THE HOUSING OF THE DRAMA." PRIVATE THEATRE, BERLIN.

Victoria Garden (so generously given to the public by the late patriotic Mr. W. H. Smith) till it meets the Embankment in Grosvenor Road. With a clear, unimpeded frontage to the river and a broad street on its left bank, the view from a new Lambeth Bridge, looking down the Thames, with the Houses of Parliament on the left and Lambeth Palace on the right, would be a noble prospect, second only, if second at all, to Waterloo Bridge and Somerset House. But what does the scheme of these gentlemen propose? Not any real extension of the Victoria Embankment, as we have hitherto understood the Embankment to mean, open to the roadway, but a new block of buildings to be erected between the embanked river and the roadway on the west. We are not in love with Millbank Street as it is, but it does not block the riverside more than this proposed erection will do. Messrs. Mowlem and Burl's granite wharf, and the red sails of the lighters, and the barges unloading their not unpicturesque burdens of hay and straw, which now fascinate the æsthetic artist's eye, would be preferable to such modern dwelling-houses as the syndicate have coloured in their plan. My contention is that Abingdon Street and Millbank Street should not be intrusted to any set of private indi-

viduals with the grant of compulsory powers of destruction and construction. The national and metropolitan value of these sites vindicates the unique claim of a responsible Parliament to deal with them. Patriotism and business may be combined; but we may not forget the reasonable distinction drawn by an acute observer of Republican Rome—

THE demolition of some buildings in Church Street, Sheffield, has brought to light an interesting old ceiling. It was concealed by a false roof. It appears to represent a firmament, the stars of gold being spangled upon blue sky. Unfortunately, as it was in plaster, it was impossible entirely to preserve it.

IN addition to an undertaking on the part of the Office of Woods to make several sections of roads in the Forest of Dean, at a cost of about £10,000, comes a further proposal, also from the Crown officer, for making a main road from Lydbrook to Lydney, which would take a course right through the heart of the forest, and which, it is estimated, will cost another £10,000. The distance is about ten miles.

IN the Kettering, Wellingborough, and Rushden district the Midland Railway Company is about to make considerable alterations. At the first-named town the enlargement and improvement of the station is fast approaching completion, and now the Company has turned attention to Rushden. The sum of £7000 is to be spent on enlarging the accommodation, and workmen are now engaged in making the station double its present size. There is to be an up and down platform, additional sidings, &c. At Wellingborough the Company have had plans prepared for a new station,

plaintiff's services in the actual sale of the land, but also all his preliminary work of surveying, laying out, road-making, and other work necessary to fit the land for the market. In 1885 this commission system was adopted by defendants, the trustees of the Bewes Estate, also, and until 1891 the new arrangement was acted upon by both estates. In the latter year, however, plaintiff and the then solicitors of the Bewes Estate did not agree as to the course to be pursued as to the sale of a piece of land to the Plymouth and Devonport Railway Company, and, after some rather unfriendly correspondence, the solicitors acting on behalf of the defendants gave the plaintiff notice that his services would be no longer required for the Bewes Estate. At this time he had done a quantity of the necessary preliminary work for preparing large portions of the estates for sale; but, as the sale of these portions was not yet effected, he had received no remuneration in any shape for this work. Plaintiff, after sending in a claim, which was repudiated by the defendants, and after considerable fruitless correspondence, commenced an action, claiming as damages for improper dismissal the commission of £5 per cent. upon the whole estates, which he could in due course have sold, less an allowance for the

further work he would have had to do to effect the sales and for the time it would have taken to dispose of all the estates. The action came on for trial in London last

heard, plaintiff proved that within a few months of his dismissal defendants had sold large portions of the estates, and that other portions were now in the market, and

with plaintiff at any moment, and that the latter could claim no damages, and was only entitled to be paid for any work actually done by him on lands not yet sold. The arbitrator

"THE HOUSING OF THE DRAMA." PEOPLE'S THEATRE, VIENNA.

November, before Justice Lawrence and a special jury, but, after being opened, it was by consent referred to the arbitration of Mr. Charles Barry. When the case was fully

that defendants were reaping the benefit of his services, while he had received no remuneration.—Defendants contended that they were at liberty to put an end to the arrangement

has now given his award in favour of plaintiff, assessing the amount due to him at £1472 1s. and directing judgment to be entered for this sum.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
February 16th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

A CORRESPONDENT sends us the following translation of a paragraph appearing in 'La Stampa':—"In the Church of Ognissanti in Florence a fresco has been discovered representing the entombment. The fresco is divided into two parts, in the lower of which is a representation of the Picta with the Blessed Virgin and other saints at the moment of the deposition in the tomb. In the upper part is represented the Virgin with several members of the Vespucci family, the youngest of these, according to the opinion of competent critics, is Amerigo Vespucci, who gave his name to America. The fresco is by Ghirlandajo, and is one of those which have been described by Vasari."

THE dates for sending in works for the summer exhibition of the Royal Academy have been fixed. The days upon which paintings and drawings will be received at Burlington House are March 25, 26, and 28, and the receiving day for sculpture is March 29. Nothing, however, has yet transpired concerning the possible reduction of the number of works outsiders have up to now been permitted to submit, and for information on this subject exhibitors will probably have to wait until the printed forms and labels for the exhibition are issued on March 1.

In a limited competition for a new Wesleyan chapel, and Sunday school at South Kirkby, near Pontefract, the designs by Mr. Geo. F. Pennington, of Central Chambers, Castleford, have been accepted. The building is to be built of local brick and stone in a free Gothic treatment. The accommodation in the church is for 350, and 200 in the schoolroom. Choir and preacher's vestries are also provided. The cost will be about £1500.

THE new ladies' entrance to the terrace of the House of Commons is a very small affair—a door scarcely half the size of the main entrance to this fashionable summer promenade. Moreover, it is approached from the octagon or outer hall by a very narrow and precipitous staircase, which would assuredly be condemned by a County Council Inspector, if any such officer had authority or jurisdiction in the new Palace of Westminster.

THE report of the fifteenth annual general meeting of the Egypt Exploration Fund (Kegan Paul) may serve, among other things, to remind architects of the good work that is being done by the Society in Egypt. The sensational discovery of papyri at Oxyrhynchus

has somewhat thrown into the shade the services of archaeology performed by the fund in clearing and working out the plan of the buildings on the magnificent site of Deir el Bahari. A part of the temple (the north-west "Hall of Offerings") is now vaulted over; the bas reliefs are being copied; loose blocks are being, when possible, restored to their proper places. Next year the work of preservation is to be continued and crowned by rebuilding the retaining wall to keep off the debris which continually threatens the buildings from the mountain slopes behind. Those who wish to see what has been done will find it in the publication of the Fund "Deir el Bahari," the number of plates in which already exceeds seventy, and there are more to come.

THE painting by Mr. Seymour Lucas, R.A., representing William the Conqueror granting a charter to the Corporation of London has been delivered at the Royal Exchange, and a niche is being prepared for its reception on the north wall. Mr. Ernest's Croft's "Queen Elizabeth opening the Royal Exchange" is being placed in a niche on the south wall, close to "Charles I. demanding the five members," by Mr. S. J. Solomon, A.R.A., which was recently fixed close to the south doors. Five niches are now provided for, but no fewer than eighteen remain to be taken in hand.

A NEW style of workmen's dwelling is being put up in some of the London suburbs, with a view of combining the best features of the flat system with those of the separate dwellings. The houses in question are built with a ground floor and an upper floor, each absolutely self-contained, and each with three rooms and a kitchen. The special feature is the entirely separate access to the upper floor, so that it is quite a distinct dwelling. Houses of this kind have been built before, but the separate access was obtained by an outside staircase, both inconvenient and ugly, and in the present plan the separate access is indoors. The houses are neat-looking and built substantially, but so cheaply that they can be let at 13s. 4d. a week. It is understood that the tenant-in-chief letting the upper part for 8s. compensates himself for his risk by obtaining his own floor for 5s. 4d.

THE fine new home which the Institute of Mechanical Engineers are building for themselves near the Storey Gate of St. James's Park is rapidly approaching completion. The scaffolding is all down, and, as far as the exterior is concerned, little remains to be done beyond putting a few finishing touches to the roof. In many respects the structure out-rides the beautiful headquarters which the Institute of Civil Engineers recently built for themselves hard by in Great George Street. It has a grand sweep of frontage on the park, and contains many spacious rooms, from the windows of which a magnificent view will be obtainable of the ornamental lake and the shrubberies which go to make St. James's the prettiest of all the royal parks.

In no part of London are building operations proceeding with more activity than in Holborn, and this thoroughfare bids fair to present an almost transformed aspect in the course of the next few months. Starting from the Oxford Street end is the handsome pile of red brick buildings now approaching completion for the district post-office for West Central London. The main entrance is on the south side of Holborn, but the premises extend along the little cutting known as Hyde Street into Museum Street, and are 208ft. long by 116ft. wide. The sum of £36,000 is estimated as the cost, in addition to the £30,000 which is said to have been paid to the Duke of Bedford for the site, and the move is necessary, as the former office at the corner of Southampton Row was not only cramped and inconvenient for the requirements of this crowded and busy district, but is itself to be sacrificed in the course of further improvements, signs of which, in hoardings and excavations, are

already beginning around it. Enormous sorting-rooms and all kinds of labour-saving appliances will render this one of the best-equipped adjuncts of St. Martin's-le-Grand. Then, at Holborn Bars, the west side of Furnival's Inn will be absorbed by the extensions of the Prudential Assurance Company, but as the Inn buildings date only from 1818, no antiquarian susceptibilities are wounded.

THE Corporation of London has recently sanctioned a scheme for the extension of the Art Gallery at the Guildhall at an estimated cost of £1600. The plan, which has been prepared by Mr. A. Murray, the City architect, shows the absorption of the ground-floor offices of the Land Tax Commissioners and the Mayor's Court in Guildhall Yard. The newly-acquired space will consist of three rooms connected with each other and lighted with separate skylights, a connection with the existing galleries being made. The total floor area of the additional rooms is about 1700ft. superficial. Accommodation has been arranged for the Mayor's Court officials by utilising the space now occupied by the Land Tax Commission. It has, however, been decided that no steps shall be taken to carry the scheme into effect until equivalent accommodation at the existing rent has been provided in or about the Guildhall for the Tax Commissioners, whom the proposal would displace.

In the City of London Lord Mayor's Court, recently, before Sir Chas. Hall, Q.C., M.P. (Recorder), and a special jury, the case of Hoffman v. Halley was disposed of. It was a claim made by the plaintiff, an architect, to recover £400 odd from the defendant, also an architect, in respect of professional services rendered in connection with certain property at Barnes.—Counsel, in opening the plaintiff's case, said that in October, 1896, the defendant was desirous of erecting six blocks of mansions at Castlenau Estate, Barnes. For this purpose the plaintiff was instructed to prepare plans. At the end of 1896 or the beginning of 1897 plans were prepared, and in respect of that item the plaintiff claimed 2½ per cent. on the estimated cost of the buildings to be erected (£3500). The defendant expressed satisfaction with the plans, and requested the plaintiff to introduce a builder to carry out the work. A builder was introduced, and for that introduction the plaintiff claimed £150. The defendant afterwards saw the plaintiff, and said that he was very sorry, but he had altered his mind as to the class of property he proposed to erect upon the site at Barnes. The plaintiff afterwards prepared fresh plans in respect of the defendant's altered scheme, and, as the builder whom the plaintiff had already introduced refused to take up the matter, the plaintiff was asked to introduce another builder. That he did, and for that service he claimed £240, making altogether the amount claimed in the action £477 10s. The defendant ultimately refused to carry out the transaction, and had not paid the plaintiff for his services.—During counsel's opening the learned judge said that he thought a little temperate advice might be of use in putting an end to the dispute between brother professional men.—A consultation took place between the parties, and Mr. Cock, Q.C., for the defendant, said the suggestion of the learned judge had been accepted by his client. The defendant denied liability, but had agreed to give the plaintiff a certain sum. There would be a verdict for the plaintiff for £100.—The Recorder, in giving judgment, said he was sure the defendant had been well advised.

A VERY important proposal for improving the Marine Promenade has been discussed by the Dover Town Council. Negotiations with the owners and occupiers of a large block of property, a portion of which is in front of the Hotel Burlington, have been completed, and it was suggested that it would be a good opportunity for making a fine town improvement by the Council purchasing part of the site. It is proposed to lay out winter gardens and build bungalows and shops on the remainder. The Improvement Committee of the Council will deal with the matter.

At 133, Oxford Street, there has just been opened a permanent exhibition of Spanish Art, which includes pictures, bronzes, fans, and china. To this Louis Alvarez, director of the National Gallery at Madrid, contributes many delightful works. It includes a masterpiece of Sorolla, which was exhibited last year in the Royal Academy—a Segovian family. The specimens of pottery and china afford a good education in what Spain has produced. The modern bronzes of Spain are faithfully modelled from the crabs, lizards, or lobsters the artist desires to represent. Some of the figures are of great merit.

PASSERS along the Strand may observe that the houses in front of the Hotel Cecil are now in course of demolition. These houses are in a line with the general Strand frontage all along. They stand immediately in front of the hotel, with a narrow roadway at each end of them leading into the large court. An opening has been cleared in the centre of the row and a permanent roadway is to be laid down here giving access to the hotel behind. When this has been done the two narrow roads referred to will be closed, the demolitions completed, and rebuilding commenced. The new structure will complete the quadrangle of the hotel, with a line of shops on the ground level fronting the Strand. The new erection, however, will not occupy the site of the disappearing shops, but will be set 16ft. back, thus constituting another step in the process of the widening of the Strand that has already begun with the setting back of the frontage at the corner of Wellington Street.

For some months past the question of lighting the Victoria Embankment and Westminster and Waterloo Bridges with electric light has been under the consideration of the Highways Committee of the London County Council. In July last they prepared a scheme, which received the approval of the Council, but when they asked for the necessary authority to invite tenders for the work the Bridges Committee brought up a report stating that the Charing Cross and Strand Electricity Supply Corporation had asked permission to lay its mains over Waterloo Bridge, and the Council acceded to the request, "provided that the Corporation do supply light to the lamps on the bridge and maintain them free of cost." The part of the scheme which related to Waterloo Bridge was thus rendered unnecessary, and the whole matter was referred back to the committee for further consideration. The committee have now prepared and presented to the Council a revised scheme, which, in view of the arrangement as to Waterloo Bridge, makes no provision for the lighting of that bridge. They have, however, made provision for the electric lighting of the parapet lamps of the Embankment, for which no provision was made in the scheme previously submitted. Thus, the saving effected by the elimination from the scheme of provision for lighting Waterloo Bridge will be more than counterbalanced by the addition of provision for the parapet lamps. By the revised scheme it is proposed that 144 arc lamps shall be provided. The capital expenditure for the installation will probably be about £25,300, of which over £20,000 would be for the building and equipment of the generating station and the laying of the mains. The revised scheme has been approved by the County Council.

The chief engineer to the London County Council has issued a final certificate of the completion of the Blackwall Tunnel works carried out by Messrs. S. Pearson and Son. The tender from the contractors, as accepted by the Council on Nov. 3, 1891, amounted to £871,000. To this was subsequently added the amount of their contract for forming the raised approach roads, £8952; making the total contract price £879,952. The total sum included £50,000 provision money to be used as might be necessary in providing for extras incidental to the work included in the contract, such as engine and boiler houses for electric lighting, staircases in shafts, electric lighting plant, &c. All these items have been carried

out as well as certain extra works which were not contemplated at the time the contract was let, and which have been ordered or sanctioned during the progress of the work. The final measurement, when all provisions are made for extras and deductions on what may be called the measured bills of quantities, amounts to £830,294, or only £341 above the cost of the contract work as originally contemplated.

THE value of the work for which the provision money was intended under the original contract was £20,277, and the value of the extra works not contemplated under the original contract, but which have been sanctioned by the Council during the progress of the works, was £18,905, making a total expenditure of £869,476. There is, therefore, a balance of £10,476 available for electric plant, wiring, &c., to the credit of the Council on the total contract sum. The engineer has not been able at present to issue a final certificate to the electric lighting contractors, but the sum of £18,000 voted by the Council for the purpose will not, the Bridges Committee state, be exceeded under these contracts and the smaller ones in connection with the work. Adding this £18,000 to the £869,476, the value of the work done by Messrs. Pearson and Son, there is a grand total for all works connected with the construction of the tunnel of £887,476. This, it will be seen, exceeds only by a little over £7520, or by less than 1 per cent, the gross amount of the original contract, and the Council has obtained, in addition to the works contemplated when the contract was let, the extra works as before mentioned.

RECENTLY the Goldsmiths' Institute Building and Architectural Society paid a visit to the public baths and washhouses being erected in New Cross Road for the parish of Deptford. The baths are erected from the designs of Mr. Dinwiddy, F.S.I., of Greenwich and 5, Whitehall, S.W., and form a handsome addition to the buildings of Deptford. The elevation is carried out in red brick and Portland stone of tasteful design, though, being in a narrow road, much of its effect is lost. The grand feature of the building is the first class bath, with a water area of 110ft. by 35ft., and surrounded with a spacious gallery to accommodate spectators to the various entertainments proposed to be held there. There is a second class swimming bath which is 80ft. long by 27ft. wide. Each bath is provided with an arrangement by which the scum that floats on top of the water, can be washed into a scum trough and into the drains, so that the water can be kept free from floating matter. There are over sixty slipper baths in four departments divided into first and second class for men and women. A public washhouse and laundry, containing twenty-three separate washing cubicles and drying horses, together with a smaller establishment laundry, are planned at the rear. The walls throughout are faced with glazed bricks, a blue colour being used to relieve the white for cornices and arches over the openings. The joinery in the baths is of polished pitch pine, the woodwork in the entrance vestibule being executed in teak. The buildings throughout show much careful planning and compactness, both baths having several exits in the case of emergency. An electric light installation has been laid down for lighting the buildings, while the water supply is obtained from a well that has been sunk in the building to the depth of 250ft., the estimated yield of which is 40,000 gallons per hour. The work has been carried out by Mr. Holloway, of Deptford, and the total cost, including the engines, electric lighting, and well plant, amounted to over £37,000. The afternoon's visit terminated by passing a vote of thanks to Mr. Dinwiddy, who conducted the party.

SIR WYKE BATES, President of the Royal Society of British Artists, speaking at the distribution of prizes to the successful students of the Croydon School of Art, said the bogey of the studio assailed the artist on both the spiritual side and the material side. In the one case it dwelt unduly on the motive, and

in the other on the method. Let them not be ashamed of working for a reward. The friezes done on the Parthenon by Phidias were "pot boilers," and the great painters of the Renaissance worked for money. If their work was fine Art it would live, even though they had done their duty to those who depended on them by boiling their pot. The only weapon with which to combat the bogey was sincerity. In defence of English Art he said it was not the rôle of England to play second fiddle, and England had shown itself as strong in poetry and art as in arms and statesmanship and adventure. The two special developments of modern art, landscape and water-colours, had come absolutely from the English school.

At a meeting of the executive committee, held at Whitby, Canon Rawnsley presented the design for the cross to be erected in the churchyard of St. Mary's, which had been prepared by Mr. Hodges, of Hexham. The design is based in scale and treatment upon the four finest specimens of Anglian crosses remaining from Caedmon's time. The design, with the estimate of the stone carvers, Messrs. Beall, of Newcastle, was provisionally accepted.

OLD Etonians will hear with mingled feelings of the decision that has been made to demolish entirely the Sun Inn, which for three centuries has formed a picturesque feature in the Architecture of the High Street. The inn is the property of Eton College, which, however, is not primarily responsible for the demolition; and there are some interesting relics of a past age, some of which it will not be possible to preserve. At a small table, almost outworn with age, George III. used often to dine when he went to college. The old pump bore the date 1742; and on the front wall there was, oddly enough, a plate affixed in the last century by the Sun Insurance Company in the early days of fire-plates. The house possessed some fine arched oaken beams, and the laths were perpendicular and fastened with willow twigs. The new structure, with its mahogany and painted glass, may be a more comfortable hostelry; but it will have lost the old-time associations by which the Sun holds a cherished place in Etonian memories.

It is announced that a determined effort is about to be made to restore the whole of the venerable and historic building of Paisley Abbey. In 1862 the nave, which, though in a somewhat dilapidated state, had been used as a place of worship by the parishioners, was, after considerable expense, repaired and beautified. It is a stately church, and presents architectural features not to be found in other ecclesiastical buildings in Scotland. The transept and choir are partly ruinous. They are roofless with only their walls standing. Shortly before the Reformation the central tower, which had been built by the last Abbot of Paisley, also the last Archbishop of the old church, fell from being insufficiently founded, and crushed in the choir and transept in its fall. The Reformation, when it came, found the monks singing mass in the nave. The present movement to build up the ruinous part of the church has been promoted, in the first instance, by the congregation worshipping in the western portion, who have offered to subscribe £10,000 towards the scheme of restoration. Dr. Rowand Anderson will be the architect.

SIGNOR MARUCCI, the disciple and successor of the great Christian archaeologist, Giovanni Battista de Rossi, has made a very important discovery on the Palatine Hill, Rome. He has found on the wall of a chamber in the palace of Tiberius a "graffito," or rough drawing, with an inscription representing the scene of the Crucifixion of Jesus Christ. There is the cross, surrounded by soldiers, and under each soldier is inscribed his name in Latin. It would appear as if the picture had been the work of a soldier who had been present at the Crucifixion. This discovery recalls the fact that there exist, in the Valley of the Bar, some eight miles north of Grasse, a series of rock carvings reputed to be of even more remote date. They

consist of inscriptions and rude drawings on the rocks, and extend for several miles. They are known as the Maraviglie, and are said to have been executed by the soldiers of Hannibal on their way across the Lower Alps. They represent chiefly figures of men and beasts and implements of war. So great is their number that the stones of which the adjacent village church and houses of Salagrifon are built are covered with them. Some twenty-five years ago they formed the subject of a pamphlet by Dr. Muggeridge—but they are little known even to French archaeologists and travellers, while probably not one person in a thousand of those who visit the Riviera has ever heard of them.

A SMALL but important improvement is in progress in St. James's Park. At the point opposite Buckingham Palace, where the Mall joins the roadway of Constitution Hill, there is an extremely sharp angle, which, with the increase of carriage traffic, has of late years grown more and more dangerous. Concurrently with the repair of the roadway, this angle is now being cut off, and anon an easy curve will take its place. The alteration involves the sacrifice of a corner of the Green Park and the setting back of the railing thereof, but the loss is small, while the gain is very great.

At the eighty-fifth annual meeting of the Newcastle Society of Antiquaries attention was drawn to the wild and romantic ruins of Dunstanburgh Castle, which are in great need of measures being taken for their preservation. Mr. George Reavell, jun., exhibited photographs of the castle, which has probably suffered less in the way of restoration than any other similar edifice in the county. Conversely, it has suffered from neglect and dilapidation in an unusual degree. All through its recorded history it appears to have lain in picturesque ruins, for, though it does not, as far as history goes, receive any mention till the beginning of the fourteenth century, when it belonged to Thomas, Earl of Lancaster, grandson of Henry III., General of the Confederate army which opposed Edward III., and owner also of Pontefract Castle, where he was taken by the King's troops, and beheaded as a traitor, yet in the next century, in 1462, the castle of Dunstanburgh was destroyed by Edward IV. and dismantled, and seems to have remained a noble, if decaying, ruin ever since.

THE latest additions to the Birmingham Corporation Art Gallery include Mr. Onslow Ford's statue of the late Dr. Dale; Mr. J. J. Shannon's portrait of Birmingham's first lord mayor (Sir James Smith); a characteristic example of the well-known French painter, M. Bouguereau, called "Charity;" John Linnell's "The Sheep Drove;" and an early water-colour by Turner, entitled "Salisbury Cathedral." Birmingham is now enjoying an opportunity of studying the Art of Japan, Mr. Michael Tomkinson, of Kidderminster, having lent his beautiful and comprehensive collection to the city for a short time.

RAPID progress is being made with the extension of the City and Southwark electric railway, though whether it will be ready for use by the end of this year, as it was expected to be when begun, may be considered doubtful. About the most awkward work in connection with it is that going on underneath the Church of St. Mary Woolnoth. The tunnelling underneath the river east of London Bridge has not yet been commenced. So self-confident have our engineering moles now become in this subaqueous burrowing that a task which not many years ago would have been regarded as a most venturesome one, is now considered to present no serious difficulty.

THE report presented at the annual meeting of the Yorkshire Archaeological Society, held recently, stated that excavations were carried out at Mount Grace during last summer, under the supervision of Mr. W. H. St. John Hope. A commencement was made at the west-end of the church, where the foundations of the frater were laid bare, and farther to the

south, near the kitchen, part of the monastic bakehouse was discovered. This last was a building of considerable size, 12ft. in diameter. At the east end of the church a cell, forming part of the lesser cloister, was partially excavated. In addition to the excavations, the outer cloister has been thoroughly drained, which adds very much to the comfort of visitors. If there are sufficient subscriptions, excavations will be resumed next summer, when it will be possible to make a complete ground-plan of this ruin, which is unique as being the only Carthusian monastery in this country where the ruins are at all perfect.

THE sole executor of the will of the late Mr. John Loughborough Pearson, Royal Academician, is his son, Mr. Frank Loughborough Pearson, who duly proved the will on Jan. 17 last. The testator, who died on Dec. 11, bequeathed to his "valued and faithful assistant," John Codd, £300, and expressed the hope that his son would retain the services of the said John Codd in his business as an architect. The testator further directs that within six months of his death his son shall purchase two annuities of £60 each for the testator's sister, Sarah (who, a postscript to the will states, has since died), and one for his sister-in-law, Sarah Christian. To his son the testator bequeaths the residue of his estate absolutely. The amount of personalty has been returned at £51,943 10s. 9d.

THE work of Mr. J. MacWhirter, R.A., in its kind, is among the most sought after of any seen at the annual summer exhibitions of Burlington House. This fact alone would render interesting the assemblage of drawings by him, which has just been opened at the Fine Art Society's Gallery, Bond Street. Here we can study drawings which extend over a period of at least ten years, probably longer, thus making it possible to discover whither Mr. MacWhirter is tending. In subject, too, the collection is many-sided. We have presentments of flower-fields, luxuriantly growing on the valley slopes of the Swiss and the Tyrolean Alps—the anemone and the gentian, the corn cockle and the pink, remote wayside chapels in the hill fastnesses of Italy, peeps of Sicily, of Greece, of Constantinople, and of distant Salt Lake City, to say nothing of many vicors in the artist's native land, Scotland. Above all, we here have an opportunity to study the more or less direct impressions of this fine draughtsman; if not his actual sketches, yet the drawings on which many of his widely-known pictures have been founded.

It is more than 60 years since Mr. William Charles Dobson, R.A., whose death at Ventnor is just announced, began his career as an artist. He was born in 1817, studied at the British Museum when he was 14 years of age, entered the Royal Academy School in 1836, and seven years later was appointed to the headmastership of the Government School of Design at Birmingham, a position which he held for only two years. Thenceforward he turned his attention to figure studies, exhibiting regularly at the Royal Academy. Elected an Associate in 1860, he became an Academician 12 years later. Since he had been an honorary retired Academician for some years, there will be no election.

So long ago as 1866 the late Earl of Devon proposed that the fine rood screen at All Saints Church, Kenton, should be restored to something like its ancient beauty, and that the progress of visible decay should be, if possible, checked. The apathy of many of those in residence, however, led to nothing being done, until recently the Right Hon. Lord Courtenay has taken the matter in hand. Mr. Blight Bond, architect, practising in Bristol, has been consulted in the matter, and he obtained an estimate for £316 to carry out the proposed work, by replacing the exquisite groining of the central compartment. More recently, however, Messrs. Hems and Sons have made the offer to the vicar and Lord Courtenay to do precisely the same work for £195.

DURING a great storm the Catholic Church at Minyip, Australia, was canted over to an alarming extent. Heavy props were placed in position to save it collapsing completely, these being forced into the ground by great spikes. A day or two afterwards a great whirlwind came and blew the building in position again. It is now as plump as the day it was built, the spikes holding the props to the ground being drawn by the building righting itself.

BUILDERS and others in Southport are much exercised at the present time on account of the largely enhanced prices asked for leasehold building land in the borough. For many years the rate has been a penny a yard on new leases, but, probably because there is no comparatively little building land available within the borough, the price has recently been advanced to twopence for land beyond the new infirmary, and fourpence even has been demanded for some land belonging to the same estate, but outside the borough boundary. The advances are even more marked in the cases of renewals, eightpence and more being asked in a street well removed from the business centre of the town. In one case the price works out to close upon sixteen pence a yard, and as a consequence the rebuilding of the existing premises will not take place. Sixty years ago land was leased in Lord Street at prices which did not come more than a farthing a yard, that being its full value at the time. Consequently attention is being turned to the question of unearned increment, while at the same time it is feared that the new policy will have a very detrimental effect on the growth of the town.

STATUES with heads that do not rightly belong to them are evidently commoner than it is thought. A correspondent draws attention to another, in the parish church of Yarmouth, Isle of Wight. It is of Sir Richard Holmes, who fought under Prince Rupert, and was Governor of the Isle of Wight from 1666 to 1692. This has the body of Louis XIV. and the head of Sir Richard. The statue was seized from a ship on its way to France, and the sculptor, who was on board, was compelled by Holmes to replace the head of the great Louis by his own.

At the monthly meeting of the Littlehampton School Board last week, the Clerk stated that he had received a letter from Mr. M. Stokes, of London, agreeing to act as assessor for the sum of 30 guineas, in the competition which the Board proposed to hold for the erection of a new boys' school. It was decided subject to the approval of the Education Department of the site and to Mr. Stokes' terms being inclusive, that he be appointed to act as assessor.

THE death is announced of Mr. Benjamin Stuart, for many years a managing director of Messrs. Maw and Co., Ltd. During the past ten years Mr. Stuart had resided at Broseley, where he was respected and admired for his business ability and esteemed for the many attributes of his Christian character. A warm tribute is paid to the memory of Mr. Stuart as an indefatigable worker in the cause of Methodism in The Methodist Recorder. The account given here of the interment shows how greatly Mr. Stuart had endeared himself to the people among whom he lived and worked. "Soon after five o'clock the townspeople had begun to assemble in the streets, many of them carrying lanterns. The principals of the works with which our late friend was connected, employing over 400 people, had closed until nine o'clock, and many of the employed followed in the procession, being preceded by twenty-four representatives of the church and of the business, each carrying a wreath. These had been sent by the rector of Broseley, the members of the Methodist Church, the principals of the firm, the workpeople, and many others. . . . Many of the co-workers of earlier years at Stratford gathered around the open grave at Ilford Cemetery."

FEBRUARY 16TH, 1898.

Practical Carpentry and Joinery.*

By GEO. ELLIS.

(Continued from Vol. VI., page xli.)

PARTITIONS are wood frames used to divide the interior of buildings, vertically, into rooms, &c., similarly as the floors divide them horizontally; but, as from their position the weight is necessarily concentrated upon comparatively small surfaces, their construction approximates rather to the roof than to the floor. They are used in preference to walling, in consequence of their lightness, small space they occupy, economy of construction, and facility with which they may be placed in any desired position, irrespective of the division of the rooms beneath them. They are not considered so fireproof as brick or stone walls, using the term in a colloquial sense, as of course it is utterly impossible to render any building stored with combustible materials absolutely fireproof; but I think that they might be rendered equally so if care were taken to select the more incombustible woods for their construction, such as poplar, larch, elm, or alder, and fill the interstices between the timbers with slagwool, kept in position by stout wire netting, to which the plaster covering could also be secured. There are two kinds of framed partition, the quarter, and the truss, the former so called because it is constructed of quartering—i.e., stuff of rectangular section, $4\frac{1}{2}$ in. by 2 in. or 3 in., has to be carried by the floor upon which it rests, or upon a wall brought up from the basement, the latter made self-supporting by trussing or reducing its rectangular shape to triangles by braces,

&c., as in a roof truss, thus rendering its shape unalterable, and directing its strains to the boundary walls. A quarter partition is shown in Fig. 70, and consists of a head, H, sill, S, door-post, D, studs or quarters, Q. One half of this Fig. is shown as a brick-nogged partition, the other half as lathed and plastered. For this purpose the studs are placed from 1 ft. to 2 ft. apart, according to the length of the laths to be used, these being usually cut in lengths of 3 ft. and 4 ft. for brick-nogging—i.e., when the interstices are filled with bricks set in mortar, the studs are spaced some multiple of a brick apart, as 27 in. or 36 in., and about every eight courses in height a row of nogging pieces, N, are inserted to tie in the bricks, which of course have no cross bond. These pieces must be the same in width as the thickness of the frame, but should not exceed 1 in. in thickness, or their shrinkage will destroy their hold on the bricks. They should be grooved into the studs $\frac{1}{2}$ in. at each end, and inserted as the brickwork is built up, and lightly nailed. A much better tie, however, is formed with lengths of hoop iron, turned up at the ends, and nailed to the studs as the work proceeds. (See A, Fig. 70.) Quarter partitions are sometimes filled in with a concrete composed of coke breeze and cement, four to one, the studs, with the exception of those

bounding the openings, being replaced by $\frac{1}{2}$ in. iron bolts, as shown by dotted lines in Fig. 70. These partitions must be placed directly over a joist, and not between them, unless resting on a wall below. There is no necessity to

FIG. 70. QUARTER PARTITIONS.

build the head and sill into the walls, and as a matter of fact it is better not to do so, as in the case of any settlement of the supporting floor, the ends of the horizontal timbers being secured, they would be unable to follow, with the result that the plastering would crack in all directions. It might be argued that throwing the whole weight on the floor would hasten or cause a settlement, but if that result were feared the partition should be made self-supporting by trussing, when the entire weight would be thrown upon the walls, and the settlement would be uniform. No braces are required in these frames, the stiffening of the studs being accomplished by the horizontal nogging pieces. The studs are fixed either by notching them over 1 in. by 1 in. fillets nailed to the head and sill, or by stub tenons in mortises $\frac{1}{2}$ in. deep, and one quarter of the thickness of the framing. Plastered partitions can be of any thickness to suit requirements, but brick-nogged must be either $4\frac{1}{2}$ in. or 3 in., the latter size, with the bricks set on edge, being only used for inferior work. If any of the stuff used exceeds 2 in. in width on the face, it should be chamfered to reduce it to that width, or otherwise the break in the continuity of the key of the plaster will cause it to crack. When the width of the timbers renders this course impracticable, counter-lathing or brandering must be resorted to. A self-supporting trussed partition is shown in Fig. 71. This partition runs in the same direction as the joists, and it does not support the floor. There is a single opening for a door; the head and sill are 6 in. by $4\frac{1}{2}$ in.; the doorposts $4\frac{1}{2}$ in. by $4\frac{1}{2}$ in.; braces, B, 3 in. by

FIG. 71. A SELF-SUPPORTING PARTITION.

* All rights reserved by the Author.

FIG. 72. A TRUSSED PARTITION CARRYING A FLOOR.

4½ in.; studs, 2 in. by 4½ in.; doorhead, 3 in. by 4½ in.; nogging pieces, 1½ in. by 4½ in. The posts should be joggled, as shown, both to reduce weight and scantling, and to form abutments for the braces; they should also be cut ½ in. short, to counteract settlement when set up. The central post is secured with wrought iron straps, 18 in. by 2 in. by ½ in.; the feet of the braces are bridle-jointed to the sill, as shown in Fig. 74. The nogging pieces and the studs are halved together, and the latter stub tenoned to the head and sill, and cut to the braces, as shown in Fig. 76.

Fig. 72 shows a strong trussed partition supporting a floor in addition to its own weight, as this frame runs at right angles to the floor joists. The sill is interrupted at the doorways, and a fresh member is introduced above the doorheads to act as a tie beam to the upper part. This is called the intertie, I, and it should always be continuous from wall to wall, as it practically carries the whole weight of the framing, that of the lower portion being first brought to the foot of the king-post, K, from whence it is carried to the head (this part being rendered practically continuous by the iron strap), and then transferred to the walls at the ends of the intertie. The intertie should rest upon and be secured to wood or stone templates, and thus act as a tie to the walls; pieces of elm or teak, about 3 ft. long and 4½ in. by 3 in., answer the purpose excellently. The head and sill should not be allowed to take a bearing at the ends at first, a clearance of half-an-inch above and below being made for the settlement of the walls. The same precautions as advised for roof trusses will apply to these frames, and suitable scantlings for a truss of this description would be: head, 6 in. by 4½ in.; intertie, 7 in. by 4½ in.; sill, 3 in. by 4½ in.; king-post, 3½ in. by 4½ in.; braces, 5 in. by 4½ in.; door-posts, 3½ in. by 4½ in.; heads, 3 in. by 4½ in.; studs, 2 in. by 4½ in.; nogging pieces, 1½ in. by 4½ in.

Fig. 75 shows a large double-framed partition for two stories, self-supporting, and carrying three floors, &c., with two small doorways above and one large one below; also an opening for a passage. Such a large framing as this would have to be built up in position, being first fitted up on a platform or floor, and the various parts marked for identification. It consists of two queen-post trusses connected by straps; the upper one, having the lower suspended from it, is made of heavier timber. The feet of the principal braces are secured by bolts, the joints being similar to Fig. 74; the diagonal braces in the upper truss are notch-halved together and screwed, the doorheads are bevel shouldered, as shown in Fig. 75, to avoid weakening the top of the posts, and the passage post should be stepped as shown to withstand the thrust of the lower brace; the nogging pieces are halved to the struts and housed to the posts, where possible, in con-

tinuous rows to stiffen the studding; the floor-joists are trimmed into the sills, which act as binders. The scantlings of the upper truss are: head, 8 in. by 6 in.; intertie, 9 in. by 6 in.; sill, 10 in. by 6 in.; top queen and braces, 6 in. by 6 in.; straining head, 6 in. by 3 in.; lower queen and braces, 4½ in. by 6 in.; door-posts, 3½ in. by 6 in. Bottom truss: intertie, 8 in. by 6 in.; sill, 11 in. by 6 in.; queens, 4½ in. by 6 in.; braces, 5 in. by 6 in.; doorhead and straining head, 3 in. by 6 in.; studding, 2 in. by 6 in.; nogging, 2 in. by 6 in. The spaces for the doorways should always be formed rather larger than the fittings actually require, to give the joiner opportunity to fix the casings square and plumb, as frequently the framing will settle out of square. These frames should be set up as early as possible in a building, so that they may settle down to their bearings, and have a chance of shrinking before the plaster is applied. Of course, in basements, all partition walls should be of brick entirely, and it is also considered advisable by many to use them also on ground floors, but if a damp-course is laid beneath the sill, no danger need be apprehended. Partitions are sometimes filled with sawdust after they are plastered to deaden sound, a few laths being left off at the top for the purpose.

Powdered sulphur, or some other insecticide, should be mixed with the sawdust before filling in. The Metropolitan Building Act requires that the interstices of a partition between floor and ceiling shall be filled with concrete pugging or some incombustible material. The weight of a square of framed partition varies from 1500 lb. to 2000 lb., the weight of a square of single flooring averaging 1600 lb., and of framed flooring 3000 lb.

Moveable partitions are used in public buildings, &c., to temporarily divide large rooms into smaller ones, they are either made in leaves about 2 ft. wide of 2 in. framing, the upper part glazed, and with ball castors at the bottom, so that they will run in any direction, the leaves hinged with steel ball-bearing

butts, or of narrow iron slips hinged together, and winding on to a drum let into a recess in the wall, the drum being actuated by geared wheels and a winch handle. This form requires guides, usually of iron, let into the floor and ceiling, for the sheets to slide in.

(To be continued.)

Surveying and Sanitary Notes.

MR. HERBERT H. LAW, an inspector of the Local Government Board, has held an inquiry at the Rhymney Urban District Council Offices into an application made by the District Council for power to borrow a sum of £10,000 for the purpose of carrying out a system of sewerage and sewage works for the district. Mr. Ilywarch Reynolds gave evidence of the receipt of an order from the Joint Sanitary Committee of Glamorgan and Monmouth to discontinue the pollution of the Rumney river by emptying the sewage of the town into it. He further detailed the results of visits paid by a deputation, consisting of some of the members of the Council and its surveyor and medical officer, to several places to inspect sewage works, with a view of choosing the best possible system, and the minutes were produced authorising the borrowing of £10,000 for the purpose of carrying out the work. Mr. W. Frazer, surveyor to the Llandaff and Dinas Powis District Council, who is engineer for the proposed works, explained the plans, &c. Mr. G. Rudd Thompson, county analyst, spoke to the analysis of the samples of effluent water submitted to him. Mr. W. Kaye Parry and Professor Hartley, and Dr. G. Revington and Mr. T. A. Shegog all spoke to the efficiency of the oxygen process.

THE City Commission of Sewers, which has had an existence of over 230 years, is now no more. The authority is merged into the City Corporation under the title of the "Public Health Department." The name of the Commission, which was originally established by the Act of 1667 for rebuilding the City after the Great Fire which occurred on September 2nd in the previous year, has long since ceased to fully describe its work. Besides being the Sanitary Authority and Burial Board for the City, it carried out some duties which in other

FIG. 73. A DOUBLE FRAMED PARTITION.

parts of London are under the County Council. As is well known, it was responsible for the improvement and cleansing of the streets, the paving, and the lighting. The Commission has always prided itself on the high standard of its administration, and so far back as 1867 it decided to carry out the street cleaning and dust removal itself, so as to be absolutely sure

FIG. 76. SKETCH OF JOINT FOR STUDS IN BRACES.

that the work was efficiently and promptly done. There was a staff of about 700 employed in the cleansing department, and every year upwards of 70,000 tons of refuse and street sweepings have been removed to Lett's Wharf, where they were partly burned and partly sifted. The Commission maintained workshops for the manufacture of its vans and appliances. During the past fifty years the Commission has spent something like £3,000,000 on street improvements, and within that period has widened or improved more or less every

thoroughfare in the City. Among the other institutions which the Commission maintained is a cemetery at Ilford which was laid out at a cost of £82,000, and is carried on as a commercial enterprise. Last year there was a revenue of over £6000, which more than met the expenditure. While entitled to raise a consolidated rate of 1s. 6d. in the pound and a sewer rate of 4d., the Commission has always kept well within that maximum, its total rate being latterly but 1s. 4d. in the pound. Its debt is being annually reduced; four years ago it stood at £1,716,000, and is now £1,405,000. The Commission has consisted of members appointed by the City Corporation, but has worked on independent lines under its own Acts of Parliament and standing orders. All the official staff are transferred in a body to the Corporation.

The annual dinner of the Surveyors' Institution was held at the Holborn Restaurant on the 9th inst., and was attended by upwards of 200 members. Mr. Christopher Oakley, the president, occupied the chair. The Institution was founded in 1868, incorporated by Royal Charter in 1881, and at the present time numbers about 3000 members, representing a growth from 150 to 3000 in thirty years.—After the customary loyal toasts, the Chairman proposed "The Houses of Lords and Commons," to which the Earl of Jersey and Mr. Jesse Collings responded.—On behalf of "The Bench and the Bar," proposed by Mr. R. Vigers, Sir Richard Webster, the Attorney-General, responded.—Mr. Wheeler, Q.C., proposed "The Surveyors' Institution," and referred to the steady progress which that association has made in recent years. From the numerical standpoint, the Institution now occupied the second place among professional societies, omitting, of course, from this comparison those ancient corporations the law societies and the two branches of the medical profession. They had introduced a system of professional examination of a most practical character, carefully adapted to the requirements of the various branches of the Profession, and had actually examined 3228 candidates in the last sixteen years. Moreover, it had accumulated funds sufficient for the construction of a handsome building, now in course of erection in Great George

FIG. 75. DETAIL AT C.

Street, designed by Mr. Waterhouse, R.A., and estimated to cost £30,000.

HAMPTON COURT PALACE.*

BY JOHN BELCHER.

(Continued from page 16.)

THERE is an estimate by Sir C. Wren, given in Mr. Law's book, which tells us what work was proposed and from which we can infer the condition of the works in hand. I think I will quote this, as it is a good model of the sort of communication to a client on such matters:

ESTIMATE OF FINISHING PART OF HAMPTON COURT.

To the King's Most Excellent M^{tie}.May it please y^r M^{tie},

Your M^{tie} having been graciously pleased to signify y^r comand's to me, that I should give an estimate of the expense of fitting the Inside of the Roomes of State at Hampton Court, from the entrance out of the Portico, to the roomes already finished above staires, containing the Great Staires, the Guard Chamber, the Presence Chamber, Privy Chamber Drawing Roome, Ante Roome, Great bed-chamber, Lobby, & Gallery for the pictures; in pursuance of this comand I humbly represent that although a perfect estimate of Finishing the Inside of any house is as uncertain as the charge of Furnishing, & is more or less according to the Intention of the owner; yet upon supposition that your M^{tie} would finish as decently as the greatness of the Roomes seems to require, and having consulted y^r M^{ties} officers of the workes what is requisit to be don, the charge of each Roome, I have represented the work of each Roome, and the total expense as followeth.

1. The Great Stair to be made with steps of the Irish stone, such as are at Kensington, but longer and easier, with Iron Rayles of good worke, the floor and Harth-places to be well paved with marble; the walls to be wainscoted twenty feet high, with fine Dore-cases.

2. The Guard Chamber to (be) fitted for Armes as at Windsor and other houses.

3. The Presence Chamber to be fitted for Hangings with marble in the Chimney and the Stooles of the Windowes and proper Ornaments.

4. The Privy Chamber in like manner.

5. The Drawing-roome with some variety, as having the best furniture.

6. The Anti-roome well finished.

7. The Great bed chamber to be perfected.

8. The Gallery to be fitted for the Cartoons, with wainscote on the windowe side, and below the Pictures and between them, to preserve them from the walls, and with a marble chimney & marble Soyles in the windowes, and other things proper to complete the same.

9. The Lobby between the presence and Gallery to be ceiled and finished.

10. The boards of these Roomes (being already provided very good and drie) are to be layd after the best manner, without nayles and with battens under the joynates.

The expense of this worke thus performed by good artists will amount to the sum of . . . 6800*li*.

All the insides of these Roomes have been long since designed, and shall be presented to Y^r M^{tie} for your approbation and correction, and accordingly the expense may prove more or less; but I am humbly of opinion the worke may be decently performed to your M^{tie}'s satisfaction for the same above mentioned.

It may further be considered that other things will be required for the accommodation of those who are to be neare your Royall person, and that the Courtes must be paved, more sewers made, and the water brought to more places, and other things necessary for your M^{ties} service which may be estimated as they are directed.

All which is most humbly submitted.

April 28, 1699. CHR: WREN."

Thus we gather that the east and south sides were externally completed, and also the upper rooms, but that the State rooms and staircases

were not. But the King contemplated further extensions, and there is a plan belonging to H.M.'s Office of Works showing what I have little doubt had been a part of Wren's scheme from the first, the formation of

A NEW AND GRAND APPROACH

on the north side. Such new entrance was to be made commensurate with the grandeur of the new buildings then in hand. The plan shows the great hall as the central feature, with a double flight of steps to the hall level. The hall, being a prominent feature, would then have taken its proper place in an orderly arrangement of buildings. The entrance court as planned was to be 300ft. long by 230ft. broad. It looks long, but we must remember that the moat made by Wolsey (probably the last ever found) was still in existence on the north side, and this court was brought out to it. Knowing what Wren could do with a colonnade, as in the Clock Court and at Greenwich, we can readily imagine the magnificence of an approach such as he contemplated here. The stateliness of this entrance to the palace was to be still further enhanced by a 60ft. drive through the park, a mile in length. And in contrast to the straight piece of water on the east side, a circular basin of water, 400ft. in diameter (5ft. deep), was to be formed at the palace end of the avenue, which at this point widened out so as to embrace a view of the whole palace. The great chestnut avenue in Bushey Park, and the Diana Basin, as it is called, are the only parts of this great scheme which were carried out. Like many another fine scheme of Wren's—like the palace of Inigo Jones for Whitehall—it was set aside. If disappointment came to such giants as these, we need not feel discouraged when our pet schemes and fine designs, by which we expected to set the world talking, are disregarded; indeed, the world has lost many good things for which it would have been the better! In carrying out the work at Hampton Court

WREN WAS HAMPERED FOR WANT OF FUNDS

(and here again we can sympathise with him!) As the work proceeded the funds ran short, and the Portland stone he loved was not forthcoming, so that he was compelled to use Bath stone dressings in many places—for instance, in the Fountain Court windows and on the south front. The upper range of windows on the east side of the court have all been renewed in Portland stone during the last few years. Sir John Taylor, in whose excellent hands the care of the structure is now placed, is also at work on the south front. To such a strait was Wren reduced that until a few years ago the central part of the south front was in cement. Now it is Portland, as originally intended. Apart from its durability, Wren no doubt appreciated Portland stone on account of its weathering to a delightful silver grey, contrasting admirably with the red brick. That he regarded colour effects is evinced by the bricks and slates he made use of. You will notice the difference in tint obtained by the dark red bricks in the base or lower story of the building and the bright colour of the "rubbers" above.

ON THE SOUTH FRONT

there is a slight difference in the colour of the lower bricks. Whether this arises from the "weathering" on this side, or is the result of another kind of brick used, I am not certain. The lower brickwork runs nine courses to 2ft., and the gauged and rubbed work above measures nine courses to 1ft. 11in., so the difference is slight. I do not know who invented "gauged" brickwork, but if Wren did not do so, it certainly cannot have been introduced much earlier. The work at Hampton Court may be said to be after the Dutch manner, partly in compliment to Dutch William and partly it may be by his influence. It is lighter and less severe in treatment than many of Wren's other works, though without any loss of dignity or of monumental effect. Through it all, however, he has retained the English tradition. Whatever he assimilated he beautified. If there was any alloy, the gold predominated, and the

English stamp was upon the whole. Mr. Maule, to whom I am much indebted for information, and who has kindly lent me the beautiful drawings and studies he has made of Hampton Court (they are doubtless known to you, but I commend them again to your notice for excellence of draughtsmanship and accuracy), has pointed out a curious, and to me unaccountable,

DIFFERENCE ON THE EAST FRONT.

On the south-east angle there are twelve stone quoins, and only eleven on the north-east corner. You will see this on Wren's original elevation, so it would appear to be intentional. There are other variations; one notable one I must mention. The width of the windows does not always correspond on the outside and on the inside, as you will find in the rooms at the south-east corner. They are divided into four divisions by sash-bars, but inside there are only three divisions. Here Wren sought to reconcile the need for uniformity in the exterior with that for proportion in the interior. He could have sacrificed the latter, as the spacing of the windows shows, but then if you stand and look at the proportion of window to wall space, the relative scale of one to the other, which is too much neglected nowadays, you will readily admit at what a sacrifice this must have been. Such an expedient would not be permitted now, and I have not the heart to find any fault with Wren, especially as it teaches us a most valuable lesson. Again, with regard to

THE CIRCULAR WINDOWS.

a beautiful feature (which we are always trying to reproduce). They were designed for the upper part of the large galleries and rooms, and how finely they come in the guard room (the first to be completed) we at once admit, but in other places these windows form the light to the entresol rooms, and some are blanks. Though the purpose is not manifest on the exterior, it is legitimate, and the way the architrave to the circular windows is managed in these rooms is excellent. Mr. Law severely criticises the pediment on the east front as being more or less a sham; but his opinion as to what Wren should have done I do not think will commend itself to an architect. He considers the pediment should rise above the balustrade, and stand out with only the sky as a background! No; Wren was quite right, and I might cite numerous good examples of this decorative treatment of the pediment; but I must pass on and talk of the carving on these two fronts. That in the pediment is by Caius Gabriel Cibber, and represents "The Triumph of Hercules over Envy." Mr. Law is my authority for attributing to him

THE COATS OF ARMS

supported by cupids. The master carver was Grinling Gibbons, but he was not a figure sculptor, so that this may account for the work by Cibber. Grinling Gibbons is responsible for the rest of the carving, though William Emmett did some of it. Gibbons was excellent as a wood carver, but these heads and keystones on the arches of the ground floor windows in stone are so undercut, especially those with the initials of William and Mary in monogram, that most of the latter, at least, have had to be recarved—and, what is somewhat unusual, they have been quite as well done as the original. Beautiful as they are, however, the material has not been recognised, but has been treated as wood. The beautifully carved lintels and cills projecting over the entrance of the east front are in marble, and are carved on the underside. There were originally metal figures above the columns on the south front, but these were removed to Windsor by George IV. Lately two figures have been sent from Windsor by the Queen, to occupy what is said to have been their old position against the central piers on the south front. The stone pedestals are there, and the figures appear to fit them. They represent Hercules and Mars. These figures are found reproduced on a small scale as supporting the firedogs in one of the fireplaces of the State apartments. Mr. Law has brought to light the important fact, viz., that

* A paper read before the Architectural Association on Friday, February 4th.

the ironwork at Hampton Court was designed by Jean Tijou, a Frenchman. It was carried out in England, and Huntingdon Shaw, who has hitherto enjoyed the sole credit, most probably worked on it. I must now rush through

SOME OF THE ROOMS OF THE PALACE, entering by the King's staircase. The walls and ceiling of the staircase were decorated by Verrio, in the manner he had made fashionable. How far Wren was responsible we cannot say. Verrio was the master painter, and did what he pleased. Passing through the King's Guard Chamber, we can only stop to notice the carved architraves and beautiful panelling in Norway oak, with garlands in limewood by Gibbons, and the large panels of excellent detail and proportions, which are characteristics of Wren's work. The chimney-pieces have bold and varying architraves to the fireplaces. The King's rooms, which occupy the south block, lead one into the other. At the back of these, and looking into the Fountain Court is the King's Gallery or Great Council Chamber. This gallery, which has, therefore, a north light, was specially arranged for the cartoons of Raphael. It is 117ft. by 24ft., and 28ft. high. For some reason, the circles which we see in the Court, and which correspond to the circular windows in the south and east fronts, are blanks. The light, therefore, is not so good as it might have been if they were windows. At present this gallery is spoilt, and its fair proportions hidden by a number of projecting screens on which are exhibited small pictures. The Queen's apartments are on the eastern side, which is the principal front, Queen Mary's writing closet being at the corner, and adjoining the King's writing closet. Next to it is the Queen's Gallery. This is

A FINE ROOM HUNG WITH TAPESTRY, which looks remarkably clean and new. With regard to this tapestry I should like to record the fact that this was discovered thirty-five years ago by the present courteous superintendent at Hampton Court, Mr. W. H. Pleasants. A picture having been removed, a defect in the woodwork behind made it apparent that some material was at the back like tapestry. Mr. Pleasants reported his suspicion to Lord Mount Temple, who at once sent word that he would make an inspection of the Palace, and that some of the woodwork was to be removed. Being an admirer of tapestry he was delighted to find that Mr. Pleasants' suspicions were confirmed. The woodwork was removed, and although dust and cobwebs abounded, and the huge and notable Hampton Court spiders marched out, the tapestry was in good order and, after a good brushing, it looks now as fresh as ever. I am under the impression that it must have been covered up by Queen Caroline in 1735, for in Hervey's memoirs it is stated that she (the Queen) was very fond of pictures and brought a number from Kensington Palace. However that may be, we are indebted to Mr. Pleasants for a sight of the tapestry which was put up by George I. The private rooms are interesting. The private chapel being without external windows is lighted by a pretty dome. The Queen's bath adjoining is well known to most. The public dining-rooms, the Queen's private rooms in the rear, and the Presence Chamber and Guard Chamber were only finished in the reign of George II.

THE DETAILS OF THE LARGE ROOMS are rather coarse, and lacking the refinement which is to be found in Wren's work. I was under the impression that Hawksmoor had something to do with this work, but Mr. Law demonstrates that it is the work of Kent. Kent did not always succeed so well as he did at the Horse Guards, and here, though there are fine features, especially in the Queen's Guard Chamber, there is a striving after "bigness" which is assertive. The chimney-piece, with the Yeoman of the Guard as consoles, is ludicrous and quite out of scale; it is a bad piece of work and fails to impress the beholder. Passing through this room, we come out on to the Queen's Great Staircase. In the absence of drawings, there is little to be said beyond that it is rather larger than

the King's Staircase. The windows in the Kitchen Court make it look lighter. The ironwork is good, and the way the risers are managed in profile is worth noting. From the landing to the right and left are the narrow galleries leading from the King's and Queen's apartments. That known as the Communication Gallery, on the west side of Fountain Court, was completed by Wren in 1699.

THE GALLERY ON THE NORTH of the staircase is now known as the haunted gallery, but that, as Rudyard Kipling would say, is another story. The gallery leads into the Great Watching Chamber, and Henry VIII's Presence Chamber, finished in 1506. The Watching Chamber or Guard Room was an unusually large apartment, with a long bow window, plaster ceiling, and tapestry walls. The gallery also led to the Chapel, or rather the Royal pew. If we draw a centre line through the Chapel, pew, and Great Hall we can see that they have been planned in relation to each other. Unless Henry VIII. destroyed Wolsey's Chapel, &c., as well as the Great Hall, this is additional evidence that the Hall was not enlarged by him. The Chapel was refitted and altered by Wren, and its carving by Gibbons and inlaid wood reredos reminds us of Trinity Chapel, Oxford. The staircase to the Royal pew from the ground floor is spacious and good in detail. The view of the ceiling and the whole Chapel from the Royal pew is very striking. I cannot refer to any of the other rooms in the Palace, as they are but little known to me, but I may just draw attention to the kitchens, which are well worth a visit.

THE GREAT KITCHEN contains the utensils and the cooking appliances, which look as though they had been undisturbed since the cook last used them. Notice the double arches over the chimney openings, the single keystone serving for the relieving arch as well as the stone arch under with its joggle joints. I have but touched the fringe of the subject, but I hope I have said just enough to kindle the desire to know more about these interesting buildings. In Hampton Court the student has a great store-house of architectural treasures. I have only had time to speak of the buildings in a cursory manner, but let me advise you to make separate studies of the chimney-pieces, the fire-backs, and fire-dogs, the old furniture, consisting of bedsteads, chairs, curtains, and needlework, old card tables, and a perfect collection of silvered looking-glasses and old china. Then there is the ironwork, wrought and cast, which is a subject worthy of special notice. And, further, there is one matter about which I had hoped to say something, viz., the Gardens. These, with their enclosing walls, piers, gates, steps, and terraces, might form the subjects of many papers. All these treasures are so accessible, and sketching orders so easily obtained, that Hampton Court should long remain

A PROLIFIC MINE TO THE STUDENT.

Those who have charge of the building, with the attendants of all ranks, are the most courteous and obliging you could find. I must publicly thank Sir John Taylor for his great kindness in lending us the valuable plans, which even if not the actual work of Sir C. Wren himself, were those from which he worked, and on which he has sketched. Also for the elevations, which seem to be his original drawings, and which the Secretary, the Hon. Reginald Brett, kindly consented to have removed from his room for our inspection. I have already spoken of my indebtedness to Mr. Law, and though I do not agree with his architectural criticisms, the information and facts he has collected together makes his "History of Hampton Court" most valuable to the architect. I may say, for the information of those who cannot afford the larger work, that he has just published a handy and very complete condensed edition, which every student should possess. Mr. Maule's beautiful drawings I must again refer to. There is a good plan of the later buildings and the southern garden, and many details for which I am indebted to him.

(To be continued.)

SURVEYORS' INSTITUTION.

STUDENTS' PRELIMINARY EXAMINATION RESULTS.

OF the candidates who presented themselves at the preliminary examination of the Surveyors' Institution, held concurrently in London, Manchester, and Dublin, on the 19th and 20th ultimo, the following satisfied the examiners:—

Rowland William Alderson, Royal Agricultural College, Cirencester; Fred Tregarthen Allen, 6, Lawn Villas, Wisteria Road, Lewisham, S.E.; Charles Edward Amore, 58, Gresham Road, Brixton, S.W.; Algernon Lawrence Berry, 1, Spencer Road, South Croydon, Surrey; Ernest Witton Booth, The Grove, Ilkley, Yorkshire; Cecil Gustav Bradley, 103, Tettenhall Road, Wolverhampton; Thomas Brent, Fairlight, Shrewsbury Lane, Shooters Hill, Kent; Hubert Brooker, Elinbank, Steyning, Sussex; Eustace Montague Browne, Court House, Kingsthorpe, nr. Northampton; George Joseph Bruzard, The Vicarage, Addlestone, Surrey; Alfred Eustace Buckley, South Field, Halifax, Yorkshire; William Burman, Kiveton Park, near Sheffield; Thomas Lingfield Caton, 82, Acre Lane, Brixton, S.W.; Charles Vyvyan Chilwell, 6, Weymouth Street, W.; Robert Cobb, Mockbeggar, Higham, Rochester; Arthur George Steuart Cooke, Ashbourne, Derbyshire; George Frederick Cotching, West Lodge, Horsham, Sussex; Adolph Heinrich Dallschaft, 21, Drayton Park, Highbury, N.; Thomas Dann, Gwynant, Overcliffe, Gravesend, Kent; William John Dixon, Codicote Vicarage, Welwyn, Herts; Cyril Henry Donne, Leek Wootton, Warwick; John Wilfrid Earle, Allerton Tower, Woolton, Lancashire; Charles William Eastwood, 38, Yorkersgate, Malton, Yorks; Charles John Elgar, Crockshard, Wingham, Kent; Henry Etlinger, care of Mr. J. S. Kincaid, 7, Leinster Street, Dublin; Frederic Fletcher, Myddelton Lodge, Whetstone, N.; Walter Foster, Armaside, Hampton Hill, Middlesex; William Fox, 15, Holdenhurst Road, Bournemouth, Hants; Cecil George French, 6, Bedford Terrace, Bedford Road, East Finchley, N.; Kenneth Graeme Gairdner, 24, West Hill, Highgate, N.; Allen Gimson, 32, Fitzroy Square, W.; Edward Brougham Glasier, Edgecombe Hall, Wimbledon Park, S.W.; James Caulfield Goff, The Agricultural College, Aspatria, Carlisle; Frederic Allen Sturge Goodbody, 35, Paradise Street, Birmingham; Alfred Goodman, 4, Clapton Common, N.E.; Ronald George Gurney, Brook Street, Aylesbury, Bucks; Clement Arthur Hall, 36, Gordon Place, Kensington, W.; Graham Harding, 66, Cannon Street, E.C.; Cecil Pryce Harrison, Caerhowel, Montgomeryshire; Ernest Harrison, "Westbrook," Bolton-le-Sands, near Carnforth, Lancashire; Sydney William Hider, 80, Upper Tollington Park, N.; Eric Cecil Hill-Whitson, 14, Agnew Street, Lytham, Lancs.; Joseph Henry Hinchcliff, 13, Brudenell Avenue, Hyde Park, Leeds; Michael Anselm Hindmarsh, Cray View, Alnwick, Northumberland; Robert Thomas Hodge, Kelvin, Cottenham Park, Wimbledon, Surrey; Charles James Hudson, Armley House, Bridlington Quay, Yorkshire; Alfred Colin Hughes, 393, Moseley Road, Birmingham; Harry Hunt, 71, Parliament Hill, N.W.; Percival Hurlbutt, The College of Agriculture, Downton, Wilts.; Cecil Walter Ingram, 2, St. Andrew's Place, Lewes, Sussex; Frederick Johnson, London House, High Street, Erith, Kent; Arthur Bayly Jones, 6, Hatherley Road, Kew Gardens, Surrey; Herbert Davies Kelleway, 24, Bateman Street, Cambridge; Philip Reginald Kemp, care of Mr. G. E. Gregson, 11, Chapel Street, Preston, Lancs.; Frederick Charles Knibb, 34, Honeywell Road, Wandsworth Common, S.W.; Harry Lisney, 11, Sydenham Road, Sydenham, S.E.; Charles Living, Jun., 125, Broadway, Plaistow, E.; Philip John May, 25, Compton Avenue, Brighton, Sussex; Thomas James Mercer, 15, Warwick Row, Coventry, Warwickshire; Herbert Arthur Mitchell, 105, Western Road, Brighton, Sussex; Charles Evelyn John Mon-

* Passed at Head of List

son, The Avenue, London Road, Newark-on-Trent; Charles Percy Moss, 58, Ashley Road, Crouch Hill, N.; Alfred Edward Oaten, Glen-thorpe, Fairfield Road, Montpelier, Bristol; Hugh Earl Perks, 2, St. Paul's Square, Bedford; George Louis Pottier, 2, St. George's Villas, Whipp's Cross, Walthamstow, N.E.; Charles Edward Rawlins, 13, Grove Park, Liverpool; Harold Thomas Richardson, 52, Southbrook Road, Lee, S.E.; Henry Hubert Riddle, 139, Trinity Road, Tooting, S.W.; Gilbert Charles Rowe, Beechwood, Langley Park Road, Sutton; Willoughby John Shaw, The Yorkshire College, Leeds; Leighton Edward Shone, Woodhouses, Whitechurch, Salop; John Henry Simpson, Middleton Stoney, Bicester, Oxon; Walter John Slipper, 16, Duke's Street, Chelmsford, Essex; Cyril Herbert Smith, Buckhill, Calne, Wilts; Quentin Cullen Smith, 7, Grosvenor Gardens, Muswell Hill, N.; Harold Soper, 43, Buckingham Place, Brighton; Frank Ewart Spalding, 3, Lyndhurst Road, Hampstead, N.W.; Percy Abel Stanley, Newton Road, Burton-on-Trent, Staffordshire; Frank Edward Strudwick, 41, Park Road, Bromley, Kent; Gerald Drysdale Sweetman, Windsor House, 13, St. Thomas' Street, Ryde, Isle of Wight; Henry John Tilley, Barnhouse, Watlington, Oxon; John Reginald Tonson-Rye, The Agricultural College, Aspatria, Carlisle; Ernest Davey Tredinnick, Penln House, Craven Arms, Shropshire; Jabez Tennyson Turner, 108, Greenwood Road, Dalston, N.E.; Robert Parsons Vale, Church House, Hartlebury, near Kidderminster; Clement Harwood Vince, The Tower House, Halton, near Lancaster; Gerald Douglas Wadham, Millwood, Dalton-in-Furness, Lancashire; Gilbert Russell Walker, The Chestnuts, Long Ashton, Somerset; Leon Maitland Walton, Ingleside, Mannor Way, Bexley, Kent; William Henry James Weston, Gloucester House, Ashford, Middlesex; Francis West Wheeler, 189, Fulham Road, S.W.; Lancelot Elce Wilson, 47, Monks Road, Lincoln; Walter Alfred Wiltshire, Fairfield, Reigate, Surrey; Leonard Wragg, Loxley, near Sheffield; Kenneth James Young, 167, Brixton Road, S.W.

THE Stockport Town Council has decided to take a poll of the ratepayers on a proposal to erect a town hall at a cost of £60,000.

THE Governors of the Bridlington Grammar School have accepted tenders for the erection of a school at a cost of £10,000.

THE tender of Messrs. Walker and Co., of Keighley, for the sewerage of Morton, amounting to £4141 6s., has been accepted.

PLANS of twenty-nine dwelling-houses, of the total value of £25,500, have been lodged with the Town Council of Aberdeen by Mr. William Ruxton, architect.

THE Brighouse School Board has instructed Mr. B. Stocks, architect, Huddersfield, to prepare plans for teachers' rooms at the Common and Longroyd Schools.

THE Local Government Board has held an inquiry at Leicester with respect to the application of the Council for the Board's sanction to a loan of £54,000 for the proposed new isolation hospital at Gilroes.

THE Macclesfield Town Council has decided upon the erection of a new technical school. The total cost will be about £6000. Mr. James Stevens, of Manchester and Macclesfield, is the architect.

THE Norwich Town Council has declined for the present to sanction the expenditure of £7000 which the Sanitary Committee recommended should be spent in doubling the accommodation of the Isolation Hospital.

AN inquiry has been held at Devonport into the application of the Town Council, who seek to acquire alleged unhealthy areas in James and Ordinance Streets, and to erect thereon workmen's dwellings, at a cost of about £45,000.

THE Birkenhead Town Council has approved of plans for the erection of salt water baths at the north end of the town. The buildings will cost £10,000, and the pumps and filtering apparatus £3000. The plans include two swimming baths—one 75ft. by 30ft., and the other 63ft. by 24ft.—nineteen slipper baths, offices, laundries, &c.

Professional Items.

BRIGHTON.—The Sanitary Committee of the Brighton Town Council have issued a detailed report on the subject of the working-class dwellings proposed to be erected. The Borough Engineer and Surveyor (Mr. F. J. C. May) has gone into the subject, and submitted to the Committee full particulars of five different designs, with statements of cost in each case, based first, on the borrowing of the money for thirty years, and, secondly, on a forty years' repayment scheme. The committee have decided in favour of design B1 for Lewes Road, and design C for Elm Grove. In observations on the selected designs, and the cost, the Surveyor says: "The plans show the houses to be erected in blocks of six each. This arrangement enables the whole of the drains to be kept outside the houses, but they may also be erected in terraces. These houses have 14ft. frontages. The fronts of the houses are intended to be built with picked stock bricks, with red kiln brick dressings. The backs to be rendered with Portland cement. The roofs to be slated. The land in St. Helen's Road, being considerably below the level of the roadway, it is proposed to form forecourts or slopes, 15ft. in width, with steps leading down to the houses. This will avoid basements. The greater number of the houses on the Lewes Road site will be level with the roadway, the remainder a little below. These houses to have 6ft. forecourts. The gradients of the land upon both sites have caused the cost of forming the roads to be somewhat heavy, added to which the Elm Grove site is rendered more so by the cross roadways, which the Council has undertaken to form. The cost of forming and metalling the roadway, laying in main sewers, laying pavements, &c., for the Lewes Road site, including the half of Coombe Road, will be £499. The cost of forming and metalling the roadway, laying in main sewers, laying pavements, &c., for the Elm Grove site, including cross roadways, will be £558. In order to keep the cost as low as possible, the houses have been designed smaller than could have been wished, but I may here add that I find it impossible to build substantial houses, including the cost of formation of roads, sewerage, &c., for the sum proposed, viz., £175 per house." The cost of B1 houses will be about £197 each, with £18 added for roadway, sewers, &c., making each £215. Design C houses will cost £192, with £18 added for roadway, sewer, &c.

By the demolition of the King's Head, West-street, one of the oldest public-houses in Brighton has been removed. It is difficult to say exactly how old it was, but there is little doubt that a hostelry of some kind has existed on the site for about three hundred years. There is a tradition that Charles II. slept in the house the night before his flight to France. Until the demolition of the old house was commenced visitors were shown the room in which King Charles was supposed to have slept; and had their attention drawn to the very peculiar beam across the floor. Though it had naturally undergone considerable structural alteration, much that formed part of the original building had been preserved to the last. Now the construction of a modern hotel to take its place will very shortly be commenced.

COLCHESTER.—The Town Council, at a meeting recently, considered the report of the New Town Hall Committee, who reported that they had had a communication from Mr. J. Belcher, the architect of the premiated design for the building, stating that he, by omitting the mezzanine floor, had in amended plans brought the floor of the Moot Hall 10ft. nearer the ground, and a gallery had been arranged for in the Moot Hall to accommodate sixty additional people. He had been accordingly obliged to re-arrange the departments, but had provided for a chief constable's room looking in three directions. Three additional police-cells had been arranged for, extra accommodation for the Free Library stores,

and a lift giving easy access to the surveyor's offices. The main features of the building would remain unchanged. The upper part of the tower had been altered in design. At the four corners now would be figures representing Engineering and Commerce, Agriculture, the River Fishery, and Military Defence. Crowning the whole the figure of the Empress Helena, whose figure is represented on the various ancient seals of the borough, and on its earliest preserved charter. The Committee recommended that these amended plans be adopted, and that Mr. Belcher be appointed architect on the terms arranged at the time of the competition for plans; also that Mr. Belcher prepare the requisite plans for submission to the Local Government Board and the Home Office, and that the Town Clerk take steps for proceeding with the application to borrow, and obtaining the sanction of the Home Office to the plans as far as they affect the police station and cells. The report was confirmed by the Council.

DUNDEE.—The governors of the Dundee Royal Lunatic Asylum have adopted a scheme for a new asylum for private patients. The new building is for seventy patients. It is to be erected on the ground belonging to the asylum at Westgreen, and will be entirely separated from the present structure. It will form two blocks, partly of three and partly of four stories, and these will contain single rooms, dormitories, and day-rooms to accommodate thirty-five men and thirty-five women. In a central space between the two blocks, and connecting them by what are known as day dormitories, will be the administrative department, consisting of a kitchen and necessary adjuncts, matron's and servants' rooms, a common dining-room, and an entrance. This entrance will be used at times as a recreation room. Open fires will be placed in the apartments, and there will also be pipes fitted up throughout the whole building for heating with steam. The arrangements generally are to be of the most approved kind, while the style of Architecture will be early Scottish baronial. The building will be of local stone, with redstone dressings. The estimated cost is £18,800. The architect is Mr. T. S. Robertson.

Extensions are to be carried out at St. Mary Magdalene's Episcopal Church. The new buildings will occupy a site situated in Hawkhill and Well Road, and extending to 63 poles. They comprise church halls and rectory. The rectory has on the ground floor parish room, dining-room, kitchen, laundry, lavatory, and offices; on the first floor, drawing-room and study, and on the second and third floors, adequate bedroom accommodation. Immediately behind the house, on the ground floor, is a hall 50ft. by 34ft. and 13ft. high, capable of seating over 300 persons. Adjoining this will be a gymnasium 50ft. long by 15ft. wide and 17ft. high. The entrance to these smaller halls will be at the north side of the rectory. The large hall, capable of seating over 1000 persons, is on the first floor. The dimensions are 70ft. by 50ft. The height of the ceiling is 35ft., and 20ft. to the wall plate on either side, with an open timber roof. On three sides of the hall are galleries 10ft. wide, having four rows of seats. Over the platform is a gallery 5ft. wide, on which an organ may be placed. Access is obtained to the large hall by two wide staircases entering from Well Road, and terminating in an ample landing from which two staircases communicate with the galleries. For emergency exits the private staircase and a specially provided exterior staircase on the south side will be available. It is estimated that the cost of the halls (without site and exclusive of rectory) will be about £3500. The Rev. Edward Sugden, Coupar Angus, designed the buildings in conjunction with Mr. Robert Blackadder, C.E.

EDINBURGH.—Operations are in progress for the reconstruction of the north-west corners of the Royal Institution buildings at the foot of the Mound. It appears that the piles on which the building stands have given way to some extent at this part, and have thrown the

projecting corner, with its Ionic capitals and architrave, about 3in. off the straight. The wall was also cracked. The whole of the corner will be taken down to the foundations, the piles renewed, and the portion affected reared anew upon a more solid foundation. The north-east corner is also affected, but only to a slight extent, and the same drastic measures will not have to be taken in regard to it. The work, which is of a very delicate nature, is being carried out under the supervision of Dr. Rowand Anderson, the architect to the Board of Manufactures.

GLASGOW.—A few days since a number of the students attending Mr. Dobson's High School building construction classes visited the new baths at Maryhill, Glasgow, and were shown over the buildings by Mr. Wm. Sharp, as sistant to Mr. A. B. McDonald, the city engineer and architect for the structure. The building is situated at the junction of Hutchison Street and Gairbraird Avenue, and adjoins the Burgh Buildings; the frontage to the former street being 119ft., and to Gairbraird Avenue 117ft. On entering from Hutchison Street there is a large swimming pond (75ft. by 35ft.), with a gallery for spectators running round three sides, underneath the seating being accommodation for eighty-two dressing-boxes. There are also shower and foot-baths provided here, and committee-room. From the adjoining entrance access is gained to the men's section of the baths. Here are situated eighteen first-class baths and twelve second class, with lavatory accommodation. The washing house entrance leads to hot baths for women, and a private wash-house for towels used on the premises. Entering the public washing house ample space has been provided for thirty-six washing stalls and three hydro extractors. The boiler-house is placed outside the main building leading from Wyndford Street. The style of Architecture is very ornate, being a treatment of English Renaissance, and built of stone, has a handsome appearance.

MORECAMBE.—The contract for St. Barnabas Church has been let to Mr. John Edmondson, of Morecambe, and the first portion of the work, which is to cost £3512, is to be started very shortly. This portion includes the erection of three bays of the nave, the chancel, and the north aisle, and it is expected that the building will be ready for consecration in May, 1899. Towards the amount required to complete the first portion £2818 has already been promised or subscribed, so there is about £700 to raise yet. To complete the church two more bays of the nave, the south aisle, and the tower will have to be built, but this portion will not be proceeded with at present. The architects are Messrs. Austin and Paley, of Lancaster. This church is designed in the transitional style from Decorated to Perpendicular Gothic, and when completed will consist on plan of a nave of five bays, 72ft. 6in. long by 24ft. wide, chancel 35ft. by 24ft., both nave and chancel being same height, 43ft. to ridge; north and south aisles 18ft. and 11ft. wide, chapel 29ft. by 15ft. on north side, opening into chancel by two arches, and having a porch as entrance, and organ transept on south side. The vestries will be at the east end with separate porch. At the west end will be a tower 20ft. square externally rising 96ft. to parapet, with porches on north and south sides of same, entering the church through the tower arch 32ft. high to apex. The church will be lighted by five four-light traceried windows in aisles, east window of six lights, and west window of three lights. The materials of construction are—for walls, rubble of Heysham stone, with external dressings of Darley Dale stone; for internal facings and dressings, flecked red Runcorn stone. The roofs and seats will be of pitch pine; chancel stalls, altar rails, and table, of oak. All roofs (except aisles and tower, which will be leaded) will be covered with Ruabon red tiles. The portion to be built at present consists of the chancel and heating chamber, three bays of the nave, and north aisle.

Under Discussion.

THE WINTER SESSION.

"PROPORTION."

Mr. Hugh Stannus, of the Royal College of Art, lectured on "Proportion" before the Sheffield Society of Architects and Surveyors at the last meeting. He mentioned and explained, by means of illustrations and numerous sketches on the blackboard, the various theories of proportion—arithmetical, geometrical, harmonic, triangular, constant, difference, etc.—as applied to Architecture and other arts, showing that each contained some truth, but not the whole truth on the subject. He demonstrated that the quality of proportion subsisting in Art is not positive, but negative, and that objects which are not in bad proportion are in good proportion, within certain defined limits, in varying degrees; and he further showed the application of this theory (his own, which he had evolved after testing and finding the others to be inadequate) to various objects of three dimensions.

BRISTOL BUILDERS.

The annual banquet of the Bristol Master Builders' Association was held at the Royal Hotel, under the presidency of Mr. August Krauss.—Professor Ryan, proposing "The National Association of Master Builders of Great Britain," said Bristol was not so black as it was painted. There was not an old house but a thousand memories clustered about it. These old walls told them of a race of builders in that city who did their work honestly and well.—Mr. J. E. Turner responded.—Mr. Krauss also spoke to the toast, and said he regretted that their form of contracts was not all that they could wish, and he trusted that a new form of contract might be adopted which should give more satisfaction to all parties than that in existence. This would save much unpleasantness between architects and builders.—Mr. E. G. Clarke proposed "The West of England and South Wales Master Builders' Federation."—Mr. Krauss responded.—Mr. J. C. Godwin submitted "The Architects, Engineers, and Surveyors," and Mr. Frank Wills and Major Bruce Vaughan (Cardiff) responded to the toast.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

The fifth meeting of the session was held at Sackville Street, Piccadilly, Mr. Thos. Blashill, (hon. treasurer) in the chair. Mrs. Collier exhibited two prints from engravings on copper, by Albert Glackendar, of playing cards used in the seventeenth century, the cards being the eight and ten of swords. The Rev. H. J. Dukinfield Astley, hon. sec., exhibited several arrow heads and early flint implements found in Norfolk; also a good example of a farthing of the Irish money of Charles I. Mr. J. Chalkley Gould read a very interesting paper upon "A Novel M.S. of the time of James II." The paper was illustrated by a fine engraving of the naval engagement off Cape la Hague from a painting by B. West, showing very correctly the type of ship of the period, also by an original pen-and-ink drawing of the stern and quarter of a man of war by "Della Bella," a Florentine artist, born in 1610 and died in 1614, contributed by Mr. Patrick, hon. sec. Two original letters of Pepys to Sir Richard Rooth, dated 1678-9, and a facsimile of the illustration of the Dutch Fleet in the Medway and Thames, taken from the Hill of Gillingham by Evelyn, the original of which is in the Bodleian Library at Oxford, were also exhibited.

MASTER BUILDERS AT NOTTINGHAM.

The annual dinner of the Nottingham Master Builders' Association took place at the Albert Hotel, Derby Road. Mr. J. Wright occupied the chair, and Mr. W. Edgar the vice-chair.—Mr. J. Woodsend submitted "The

Mayor and Corporation of Nottingham." He said, as an association of builders they appreciated all the good work that the Corporation did. They knew very well that their city had few to compare with it in respect of its well-kept streets and all those things which went to make the pleasure of living in an up-to-date city like theirs.—Mr. A. Pyatt responded. He said if a somewhat more adventurous policy had been adopted by Nottingham some years ago, it would have saved expense now. A few months ago the Council passed a resolution to put down a new sewer on the Gregory Boulevard, to cost £25,000. If their predecessors had had the pluck to make the boulevard and the sewer at the same time, they would have been saved money at the present time. As to the question of a new town hall, the spending of a quarter of a million required a good deal of consideration. They were all somewhat ashamed of the present building that stood in the Market Place, but a new one would come in good time.—The Chairman next proposed "Success to the Master Builders' Association." He congratulated the members upon the activity of the past year. Another source of congratulation was the fact that they had had very little trouble with the workmen. Last year they announced that they had reconstructed the Master Builders' Association, by which a committee representing every trade undertook the matters relating to the different sections. A very voluminous report prepared by Mr. Hodson, their energetic secretary, recounted the work done by those various committees, upon which they had to congratulate themselves.—Mr. Henry Vickers and Mr. Frank Hodson responded.

GOTHIC v. RENAISSANCE.

Mr. Basil Champneys read a paper to a recent meeting of the Manchester Society of Architects, taking as his subject "A Comparison of the Claims of the Gothic and Renaissance Styles." He described the chaotic condition in which Architecture was left at the end of the last century, and some of the ephemeral phases which followed the lapse of tradition. He said the main currents of architectural revival had been on two lines, Gothic and Renaissance, and he traced in some detail the mode of development which each of these rival styles underwent. A considerable proportion of the architectural enterprise of the last thirty years had been devoted to a combination of the elements of the two styles, either by a reversion to one or other of the many types of transitional style developed in the past or by deliberately combining anew ideas and features natural to both. He was far from saying that the hopes of the future might not be bound up in some such compromise, but up to the present time it seemed to him that efforts of this kind had been too incoherent and too scattered to make any considerable permanent impression. The main object of his paper was to break a lance in vindication of the Gothic—a great style of Architecture which, after holding the field for some considerable time, showed signs of passing out of fashion. In that style more than any other were perfectly displayed principles which must be obeyed in any style which claimed to fulfil the highest conditions of architectural effect. As to the question whether there was a probability of a new style being formed, he said they would in any case have to wait for it for centuries.

INSTITUTION OF JUNIOR ENGINEERS.

The thirteenth anniversary dinner of the members of this Institution was held at the Westminster Palace Hotel. Mr. J. A. F. Aspinall, the president, occupied the chair.—Mr. J. W. Swan proposed the toast of the evening, "The Institution of Junior Engineers." He said the extension and greatness of the Empire were mainly due to the genius and enterprise of engineers, with whose future work the interests of the country were bound up.—Mr. Vorley, who responded, mentioned that the Institution now comprised 500 members.

Enquiry Department.

NOTICE.

Readers manifest a desire from time to time to assist those who avail themselves of the Enquiry Department instituted in this Journal, and many supplementary replies answering points raised in the Enquiry Department have been received from all quarters. The Editors, therefore, have decided, in order that Enquirers may benefit also by these kind offices, to publish the supplementary answers, in addition to the answers supplied by the technical experts associated with the staff of the Enquiry Department. The more widespread the information, the more effectually will the purposes of the Enquiry Department be served, and the Editors invite replies from any to whom the questions appeal, as they appear. Such answers must be to hand not later than Saturday morning for the forthcoming Wednesday's issue.

"INEXPERIENCED."—Will the correspondent signing himself "Inexperienced" send us his address?

EXTERNAL WALLS IN DOMESTIC BUILDINGS.

A correspondent at Guildford has submitted to us a copy of correspondence which has taken place between an architect of that town and the Local Government Board relating to the construction of external walls in new domestic buildings. Plans of a proposed new house were submitted to the local authorities, by whom they were rejected, until certain amendments were carried out, one of these amendments being: "The whole of the ground floor story marked 11ft. in height must have its outer walls 14in. thick if solid, or 16in. if hollow, instead of 9in. and 11in. respectively as figured upon the plans." On receipt of this letter, the architect wrote to the Local Government Board, and as the question is one of general interest, we print the letter together with the reply.

[COPY.]

Guildford,
Jan. 3, 1898.

TO THE LOCAL GOVERNMENT BOARD, WHITEHALL, LONDON, S.W.

GENTLEMEN,—A difference of opinion has arisen between the District Council and myself as to the proper interpretation of the clauses in the model bye-laws relating to the construction of external walls of new domestic buildings.

I have submitted plans and sections showing certain external walls in brickwork of a dwelling house 9in. thick; but the District Council require them to be 13½in. in thickness, and refuse to approve the plans.

The facts are as follows, viz.—the height of the walls is less than 25ft., the lengths are less than 30ft., and they do not comprise more than two stories.

I contend that under Section 19, sub-section (a), the walls in question shall be 9in. in thickness; but the District Council's contention is that sub-section (k) applies to these walls, and that they shall be not less than 13½in. thick. The height of the highest story is 11ft., but sub-section (k) reads: "Every external wall and every party wall of any story which exceeds 10ft. in height shall be not less than 13½in. in thickness."

I have submitted to the District Council that this is in contradiction to sub-section (a) and (j), the latter providing that stories may be built to a height not exceeding sixteen times the thickness of the walls.

I shall be greatly obliged if you will explain for my guidance which of the sections of the Model Bye-laws applies to the case in point.—I am, Gentlemen, your obedient servant,
Architect.

Local Government Board,
Whitehall, S.W.
Jan. 21, 1898.

SIR,—I am directed by the Local Government Board to advert to your letter of the 3rd instant, and to state that it is not the practice of the Board to advise upon questions as to the application of bye-laws in particular cases, but they may observe that under bye-law 19 (a) of the series of bye-laws to which you refer, if the wall does not exceed 30ft. in length, and does not comprise more than two stories, the minimum thickness of the wall for its whole height must be 9in. in all cases. If, however, the case comes within paragraph (k) the thickness must be at least 13½in. There is no inconsistency between the two paragraphs, and the former does not prevent its being necessary to comply with the latter in a case to which it applies.

I am, Sir,

Your obedient servant,

[Perhaps readers who have had experience of this matter will communicate with us?]

HANGING GATES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Does the construction of an ordinary five-bar gate in any way influence the tendency of the gate to pull gate-post out of the vertical? In the annexed Figs. 1 and 2, do the diagonals of parallelograms, completed

by dotted lines, correctly express action of resultant force, in each case, of diagonal brace and top rail? Does Fig. 1 create the least tendency to pull gate-post out of vertical, or would the resultant of AB, BC, Figs. 3 and 4, have a more important influence on gate-post? Has not the resultant in each of these cases (3 and 4) an equal tendency on gate post?—Yours obediently, "A CARPENTER."

In reply to your queries, the internal construction of the gate has no influence upon the post whatever; its effect is that of a rectangular plane suspended at two points, the upper point or hinge being always in tension, the lower in compression. The arrangement of the diagonal brace, however, makes a considerable difference to the strength of the gate. If it is placed with its higher end near the hanging stile, it becomes a tie, being in tension, and will have little or no effect in preventing the framework dropping, but if placed with its lower end at the hinge side, it will then become a strut, and will be in the most suitable position for the material. The method of finding the resultant force is not shown correctly in your diagrams (not reproduced). The point from which the parallelogram should be drawn is at the lower front edge of the gate, as that is the point at which the weight will have the most effect. The directions of your resultants is however, right.

Correspondence.

SINGAPORE TOWN HALL COMPETITION.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—My attention has been called to a notice appearing in your paper giving my name in connection with a Singapore Town Hall competition.

The notice in question has been inserted without my knowledge or consent, and I write to say that I am not in any way connected with this competition, and cannot undertake to answer inquiries. I shall be much obliged if you will give publicity to this fact in your next number.—I am, Sir, your obedient servant,
Ma. CAMERON.

Downing Street, London, Feb. 9.

AN INTERNATIONAL COMPETITION.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The Royal Institute of British Architects has been desired by the Marquis of Salisbury to give publicity to the International Competition for the Phebe Hearst Architectural Plan of the University of California.

In consequence of this request I should esteem it a favour if you would give me the opportunity of stating in your columns that programmes of the competition, together with maps of the site, can be obtained on application to the Secretary of the Royal Institute of British Architects, and that further photographs and a plaster relief map of the site are on view in the library of the Royal Institute.—I am, sir, yours faithfully,
W. T. LOCKE (Secretary).

PROPOSED TECHNICAL EDUCATION DEGREES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I see that at the annual meeting of the Association of Technical Institutions it was proposed that negotiations should be entered into with professional and industrial bodies, to obtain their co-operation in urging the necessity of co-ordinating the present system of examinations and diplomas, suitable more especially for day students, who aspired to take leading positions in technical industries. Now, I wish, as one interested in technical education, to protest against any extra diplomas being granted to day students other than can be obtained by those who are only able to study in the evening. I think if anyone requires a stimulus to further study, it is essentially the evening student who has almost invariably done a hard day's work previous to attending the evening classes. Besides, to grant extra facilities for obtaining distinction in technical education to day students, is to promote the theory above the practice, which I think is very much to be objected to. If, as I have been given to understand, the Association desires to obtain degrees for the technical student, somewhat akin to the degrees of our Universities, then I think it should be made difficult to obtain them, so that a high value may be placed on them. What the students of our institutes desire is not a multitude of petty degrees, but something that is worth spending years of hard study to obtain; and, further, one who cannot answer questions on the elementary part of the subjects should be unable to obtain high certificates as at present. For example, there were many candidates at the last examination in carpentry and joinery at the City and Guilds of London, who could and did pass first class in both ordinary and honours grade, and yet some of these students failed in the preliminary examination, owing to the subjects including very elementary arithmetic, mechanics, and geometry.

Such students help to lower the value of the certificates in the eyes of the public, and precautions should be taken to prevent such from obtaining any degrees if the project is ever carried out.

I would suggest that the City and Guilds issue a certificate, however meagre, for their examination in preliminary carpentry.—Yours faithfully,
"REX."

Trade and Craft.

MESSRS. THOMAS POTTER AND SONS.

We understand that the well-known business of Messrs. G. R. de Wilde and Co., carried on for the past twelve years by Mr. George Rexworthy de Wilde, at 10 and 11, Archer Street, Shaftesbury Avenue, has been purchased by Messrs. Thomas Potter and Sons, and amalgamated with their own business, which has long been pre-eminent amongst the comparatively small number of firms of ecclesiastical and art metal workers, having been established as far back as 1827, and carried on ever since at the present address (44, South Molton Street). We also understand that Mr. De Wilde, who has a deservedly high reputation as a designer of artistic work in wrought-iron, brass, and copper, has joined Messrs. Potter and Sons, and will in future have charge of this branch of their business. The combination is one that is likely to be viewed with satisfaction by architects and users of art metal work generally. Messrs. Potter and Sons, with an exceptionally skilled body of artisans, under direction of an artist such as Mr. De Wilde, should do much to encourage the revival of a taste for this particular branch of Art, of which indications have been apparent during the past few years, owing largely to the efforts of such men as Professor Herkomer, the late George Edmund Street, and other kindred spirits.

MESSRS. W. GODWIN AND SON.

The old-established firm of encaustic and art tile manufacturers, Messrs. W. Godwin and Son, Withington, Hereford (who this year are celebrating their jubilee), have recently opened a London office and showroom at No. 15, Bartlett's Buildings, Holborn Circus, E.C. They have on view a good variety of their manufactures, which are very numerous. Their floor tiles, plain and encaustic, for cathedrals and churches, have long been held in great repute by ecclesiastical architects. They have been used in quite a large number of cathedrals, both at home and abroad, as well as in thousands of churches. The plain floor tiles are eminently suited for floors of entrance halls, corridors, and general offices of large public buildings, and institutions such as free libraries, art galleries, hospitals, and asylums. They have, we believe, already been extensively used for these purposes. Messrs. Godwin's antique make of tiles are carefully prepared, and are excellent copies of ancient examples. The firm also has a variety of designs in dados in lovely artistic shadings, both embossed (Intaglio) and plain, as well as glazed tiles for walls, suitable for isolation hospitals, and all other purposes where hygienic principles are of special importance. We would specially mention Messrs. Godwin's new patent warproof slabbing. By this method it is impossible for the slabs to get out of shape or warp in any way. The cost is but a trifle more than the old method. Another feature is the excellent fender curbs, suited for all purposes. These are very carefully prepared, and made solid like a metal curb. They are extensively used both at home and abroad, one of the chief advantages being the extreme hardness of the enamel. Altogether, a visit to Messrs. Godwin's by those interested in this class of manufacture would be well repaid.

PLANS have been approved for the New Cleethorpes Church Schools.

A NEW clock, with spire, &c., is to be presented to Swansea Parish Church by Mr. Edmund Leigh Morgan, of Fernhill, Blackpill, Swansea. He has handed the matter over to Sir Arthur Blomfield, the architect, giving him carte blanche to provide an appropriate clock, with Westminster chimes.

THE Local Government Board has approved the amended plans and specifications, &c., prepared by Mr. Lerner Sugden, of Miles Bank Chambers, Hanley, and Leek, for the Bucknall Sewerage Scheme, and the work will forthwith proceed. The outlay, exclusive of land, will be about £7000.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABERTILLERY (Mon.).—Accepted for the erection of girls' schools, for the Aberystwith School Board. Mr. Geo. Rosser, architect, Newport and Abercarn (Mon.).
A. P. Williams, Abertillery (Mon.). £2,073 15
BEDFORD.—Accepted for the erection of offices and store-rooms at Electricity Works.—
Rootham and Jeakings, Bedford £2309

BROMLEY.—For the execution of road-works, Homefield-road, for the Urban District Council. Quantities by the Surveyor:—
Fry Bros. £1,598 6 2 E. Peil & Sons £1,325 9 4
R. Stockwell £1,472 10 10 S. Hudson, Street-
J. Mowlem & Co. £1,338 6 0 ham Hill Station,
T. Lawsbury £1,320 1 0 S.W. (accepted) 1,254 15 3
Surveyor's estimate, £1,175 15s. 8d.

COVENTRY.—For the execution of water-supply works, Bedworth, for the Foleshill Rural District Council. Mr. H. B. Nichols, C.E., 59, Corporation-street, Birmingham:—
H. Holloway £14,114 8 6 Clift Ford £210,988 0 0
G. Law £13,284 0 0 J. Biggs 10,370 0 0
A. E. Nunn £11,600 0 0 Amos Jenkins 9,700 0 0
H. Shardlow £11,374 0 0 Southwell* 9,700 0 0
*Accepted.

ELGIN (N.B.).—For additions to police station, Findhorn. Messrs. Reid and Witter, architects, Elgin:—
Masonry.—John McKenzie, Forbes
Carpentering.—John Smith, Forbes
Plumbing and Slating.—Alex. Forbes, Forbes
Plastering.—Robt. Cameron, Forbes
Painting.—C. W. Macdonald, Forbes
Heating Apparatus.—McKenzie & Moncur
Edinburgh £150 13

GODALMING.—Accepted at a schedule of prices for redressing and repitching 1500yds. super granite roadway. Mr. J. H. Norris, Borough Surveyor, Church-street, Godalming:—
W. Griffiths, Bishopsgate-street, London.

Work to be done will amount to between £700 and £900.
HALESOWEN.—For widening, &c., Coombs Holloway, Hill, for the Rural District Council. Mr. B. Perrins, surveyor, Halesowen. Quantities by surveyor:—
A. & A. Timmins £1,614 0 0 J. Mackay £593 18 2
Curral, Lewis, & T. Crumpton, Hales-
Martin 967 8 0 Owen (accepted) 561 10 0

HASLEMERE.—For erecting three houses and shops, High-street, Haslemere. Mr. A. J. Steadman, architect, South-street-chambers, Farnham, Surrey. Quantities not supplied:—
J. W. Humphreys, Godalming £2,185 0 0
F. Milton, Witte, £2,065 0 0
Harding Bros., Haslemere £1,970 4 0
H. Carpenter, Haslemere £1,830 0 0
Chapman and Lowry, Greyshot £1,730 0 0
T. Mack, Haslemere (accepted) £1,475 0 0

HASTINGS.—For additions to schools, Clive Vale, for the U.D. School Board. Messrs. Elworthy and Son, architects, London Road, St. Leonards:—
E. Midmer £2355 0 0 Barker and Gasson £2326 10
W. Small £340 10 0 C. Harman (accepted) 317 0
J. Geary £345 0 0 A. Wood* 273 0
*Afterwards withdrawn.
(Architects' estimate, £2342.)

KENDAL.—Accepted for the erection of six dwelling houses, Strickland Place, for Messrs. Millward. Mr. John Hutton, architect, Kendal. Quantities by architect:—
Walling and Masonry.—W. Dixon and Son,
Kendal
Slating.—Jas. Bailey, Penrith
Joinery and Carpentry.—Henry Collett, £1,710
Kendal
Plumbing.—John Hodgson, Kendal
Painting and Glazing.—James Hine,
Kendal
Plastering.—Anderson Brothers, Kendal

KNARESBOROUGH.—For the execution of private street works, for the Rural District Council. Mr. R. Annakin, surveyor, 44, Station-parade, Harrogate:—
J. Speight £1,930 0 0 G. Parsons £1,545 8 6
F. U. Simpson £1,551 5 7 A. Eskeby, Star-
W. Annakin £1,598 15 0 Beck, Harrogate* £1,406 4 6
*Accepted.

LEEDS.—For the erection of shop premises, Burmantofts-street, for Mr. Hudson. Mr. J. W. Thackray, architect, 3, Rossington-place, Gathorne-terrace, Leeds:—
Excavating, Bricklaying, and Masonry.
J. T. Wright, Hartley Hill, Leeds
Carpentry and Joinery.
Wood & Smith, King's-avenue, Leeds
Ironfoundry.
Bagshawes, Victoria Foundry, Batley
Slating.
Pickles Bros., Park-lane, Leeds £1,672 17 9
Plastering.
John Jackson, 80, Cameron-st., Leeds
Plumbing.
T. Story & Co., Cookridge-st., Leeds
Painting.
Roylance & Horsman, Bagley-rd., Leeds

LONDON.—For electric light wiring of Messrs. Welch, Margaretson, and Co.'s new warehouse, Moor Lane, E.C. Mr. Morgan Williams, consulting engineer, 89, Victoria-street, S.W. Mr. Alexander Graham, architect, Carlton Chambers, 4, Regent-street, W.:—

LONDON N.W.

ESTABLISHED 60 YEARS.

An Architectural Causerie.

Is the end of the nineteenth century an artistic age? Does the present generation properly appreciate Art? A writer in a contemporary, considering "the position of Art at the end of the nineteenth century," answers both these questions in the negative. And yet, he remarks, how much has been done to popularise Art? We have schools of art with an increased number of students in all our large towns. We hear

imitate painting on the stone. Many times, too, has he seen good painted east windows half concealed by hangings behind the altar. And then as to Street Architecture. Public and private buildings of modern dates do not, the writer asserts with some amount of truth, impress one with the idea that the public cares much for beauty. In some parts of the country, people impressed with the picturesqueness of the delightful half-timber houses of old time, have put up imitations, the timber forming no part of the structure, but consisting of a thin framework tacked on in front of the walls. Dishonest here again! Is it any wonder that Art ceases to flourish under such conditions? The towns unlovely, the country spoilt in many places by utilitarian improvements, and disfigured by advertisement boards? Where shall the landscape painter go for his subjects save to the mountain and wild rocky shore? Rustic cottages and picturesque mills have given place in many instances to modern abominations; the ivy-mantled church tower has had its ivy stripped from it by the restorer; the lead or stone tiled roof has given place to slate or tiles of glaring red brick, which will require a generation or

able, too, that the rising generation of painters and sculptors contains a far larger proportion of men who are willing to recognise Architecture as an Art, and an architect as a man and a brother. But at present it is certain that there are a far larger number of architects who take an interest in, and know something about, painting, than there are painters who take an interest in, and know something about, Architecture. This is all the better for the architects, and all the worse for the painters. This good understanding which is thus growing up between the practitioners of the various Arts and Crafts must, in the long run, be advantageous to all: but in the meanwhile it has a certain effect upon those architects who come most within the painter's influence, which is bad for all. There is a tendency among such architects to lose their own independence of judgment, and to look at things too much from the painter's or decorator's point of view. This is very noticeable in the work of those more directly associated with the Arts and Crafts, and the Art Workers' Guild, &c. Considering that painting is an easier art to master than is Architecture, and that consequently there is a stronger

NOTTINGHAM CEMETERY BUILDINGS COMPETITION. SECOND PREMIAED DESIGN. BY MESSRS. NICHOLSON AND CORLETTE.

continually of art decoration, art furniture, art drapery. The young lady of the period detests marble mantel-pieces and seeks to give a room an air of antiquity by nailing to the ceiling a long, hollow deal box, stained so that it may have the appearance of an old oaken beam or rafter. The great object now seems, according to the teachers of aestheticism, to be to make everything look like something which it is not. How different is the teaching of the modern guides to taste from that of the great master, who laid it down that truth was the one thing necessary to good Art, that it was as disgraceful for a building to have imitation ornament, common wood painted, with a view to delude the beholder into the idea that it was some rare wood or costly marble, as it would be for a lady to wear sham jewellery. The writer proceeds to further reveal the bad taste and falsity in art matters prevalent in the English home, and then turns to our churches and our street Architecture, where he alleges similar shams to exist. He tells us of churches in which cheap but "effective" ornamentation, as it is called, pretending to be something much better than it really is, may be found—stencilled canvas nailed round pillars and along the mouldings of arches to

two before Nature can repair the damage that has been done, and tone down the glaring vulgarity of the building with moss or lichen. Art is not dead, but it is languishing, adds the writer; what has been done may be done again if surrounding conditions improve, if men arise who paint and design, not for the world's praise, not for the coin that their work will bring them, but for the sake of Art itself. H. C.

The Aesthetic Architect.

THE growing interest which the younger generation of architects takes in the Allied Arts is a fact which is of great importance, and which must be a source of gratification to us all. It points to a coming time when the Arts shall be united, when we may have again a real living school of Art. It is quite the usual thing now for every architect who intends to be worthy of his Profession to paint and to model, as often as he has time and opportunity; to be acquainted with the latest ideas and theories that circulate among the painters or sculptors, and to be able to discuss them with the practitioners of these Arts. It is notice-

able, too, that the rising generation of painters and sculptors contains a far larger proportion of men who are willing to recognise Architecture as an Art, and an architect as a man and a brother. But at present it is certain that there are a far larger number of architects who take an interest in, and know something about, painting, than there are painters who take an interest in, and know something about, Architecture. This is all the better for the architects, and all the worse for the painters. This good understanding which is thus growing up between the practitioners of the various Arts and Crafts must, in the long run, be advantageous to all: but in the meanwhile it has a certain effect upon those architects who come most within the painter's influence, which is bad for all. There is a tendency among such architects to lose their own independence of judgment, and to look at things too much from the painter's or decorator's point of view. This is very noticeable in the work of those more directly associated with the Arts and Crafts, and the Art Workers' Guild, &c. Considering that painting is an easier art to master than is Architecture, and that consequently there is a stronger

A. R. J.

KENSINGTON PALACE.

THE OLD STATE APARTMENTS.

SEEING that considerably more than a century has elapsed since the old State apartments in Kensington Palace have been requisitioned for use, the intimation that, in view of the Queen's resolve, the Government has been ordered to submit to Parliament an estimate of the cost of such improvements as may be deemed necessary, will scarcely come as a surprise to anybody. If they do not actually bear the "dust of ages," the rooms in question are at any rate time-worn, and there must needs be dilapidations that will have to be made good ere the public are invited to cast their eyes over their contents. Faded, in truth, are the paintings seen on the walls of the staircase that leads to the disused apartments, and it needs but the exercise of little imagination to credit the assertion made by a well-informed writer that "on a gloomy day the strange old masquerading figures are hardly visible, but when the sun shines a face here and there comes out with startling distinctness." The flat ceiling is painted to represent a dome, and faces peer down through the skylight, and "the effect," it has been said, "when the mouldings were clean and the gilding bright, may have been very good, and Kent deserves the credit of having made the most of the resources at his command." To revert for a moment to the State apartments which are shortly to be thrown open for public inspection, it is interesting to be reminded, on the excellent authority of John Timbs, that they are twelve in number, and are reached by way of

THE GREAT STAIRCASE

of black and white marble and graceful iron-work already referred to. Some of the State rooms are hung with tapestry, and have painted ceilings. The Presence Chamber has a chimney-piece richly sculptured by the incomparable Grinling Gibbons with flowers, fruits, and heads, in form of decoration wherein he excelled. The King's Gallery, in the south front, is described as having an elaborately-painted allegorical ceiling and a circular fresco of a Madonna after Raphael. A lofty apartment, known as the "Cube Room," is remarkable for its gilded statues and busts, as well as a bas-relief in marble of a Roman marriage by Rysbrack; while the "King's Great Drawing Room," now all but empty and bare, yet shows signs of having been a bright and cheery apartment, overlooking, as it does, the gardens towards the Round Pond.

THE "QUEEN'S GALLERY."

situated at the rear of the eastern front, has above the doorway the monogram of William and Mary, and the pediment is embellished with representations of fruits and flowers in high relief and wholly detached—an example of carving which has been attributed to the wonderful Gibbons. Time was when the walls of the venerable building boasted not a few historical paintings. Of the pictures that adorned Kensington Palace in days of yore, many have found their way to Hampton Court, but the majority, seemingly, have vanished, several public buildings now rejoicing in their possession. In the reign of George II. the Royal residence in the old Court suburb appears to have contained a goodly number of priceless works of Art, and reference is to be found in chronicles of the time to Vandyck's "King Charles and his Queen," "Cupid and Psyche," and "Three Children of Charles I.," and to portraits by Kneller, Tintoretto, Titian, Holbein, and many other masters. History tells us that the aforetime favourite abode of the House of Hanover was originally the seat of Sir Heneage Finch, Solicitor-General, and afterwards Earl of Nottingham and Lord Chancellor of England; and it was his son, the second Earl, who sold it for the sum of 18,000 guineas to King William III., within a short time of his accession. By that monarch, however, a story was added, from designs made by Sir Christopher Wren, whilst the north-west angle was built by George II. as a nursery for his children.

BEAUTIFUL BRITAIN.

A CHECK ON VANDALISM.

THE necessity of preserving places of natural beauty or historic interest from ruthless demolition is too obvious to need insisting upon. Had not the National Trust for Places of Historic Interest or Natural Beauty come into existence three years ago, it is certain that more than one lovely spot would have been given over to the speculative builder instead of being the property of the nation. The National Trust, whose president is the Duke of Westminster, is an Association through the medium of which landowners and others are enabled to dedicate to the nation lands or buildings or monuments of beauty or traditional worth, whose natural or historic features they may desire to preserve for the benefit of posterity. But the Trust, says the Daily Mail, is not merely the passive recipient of such properties as may be presented or bequeathed to it. It is active in

ROUSING PUBLIC OPINION

to the necessity of preserving beautiful and interesting spots which are in danger of being bought up for commercial purposes and destroyed, and it keeps a sharp eye on all legislation which has any bearing upon the question. Thus, the Light Railways Act was suitably modified in so far as there was a danger of the Act injuriously affecting natural scenery. It will be remembered that a couple of years ago the Elder Brethren of Trinity House proposed to demolish the Trinity Almshouses in the Mile End—that charming bit of old London attributed to Sir Christopher Wren. We owe it to the National Trust, in conjunction with other bodies, that this act of vandalism was not carried out. Visitors to our lovely Cornish coast know that facing the far-famed Tintagel Castle—home of Arthurian legend; where "the blameless king" held his court, and his "Knights of the Round Table" assembled—stand the headland of Barras Head—the only point from which the castle can be seen to advantage. The headland was about to be converted into an hotel property, when the National Trust stepped in and purchased the entire estate. Thus one of the most valuable features of interest in all England has been secured to the nation for ever. In the case of Barmouth Cliff, another beautiful spot which the Trust has lately acquired, the circumstances were different. The cliff was generously presented to the Trust by a Mrs. Talbot. A similar remark applies to the Falkland Memorial at Newbury, which was transferred to the Trust by the Newbury Field Club. But one of the most interesting memorials that the Trust has acquired is the

OLD CLERGY HOUSE AT ALFRISTON,

near Eastbourne. It is an almost unique monument of the dwellings of the pre-Reformation secular clergy, and belongs to the early part of the fourteenth century. The acquisition of this house cost the Trust merely a nominal sum, but another £250 is required to put it into tenantable repair. Half of this amount has already been collected, and towards the other half the Duke of Devonshire has promised £50 if the public will give the remaining £75. This by no means exhausts the list of the Trust's achievements. It has just acquired an interesting old hall at Salisbury, known as the Joiner's Hall. It has interested itself in the preservation of the Wall of Antoninus in Scotland, which marks the most northern boundary of the Roman Empire in Britain. It has co-operated with others in the efforts made for the purchase of Churchyard Bottom Wood, near Highgate, and it has concerned itself with varying success in such objects of interest as the Fall of Foyers, Croft-an-Righ—a piece of land near Holyrood Palace—Cheddar Cliffs, Turner's house, Tyn-dall's house, the Roman villa at Darenth, "West Hill" at Hastings, "Devil's Dyke" at Newmarket, Bute House Estate at Petersham, and another pre-Reformation Clergy House near Stafford.

"PRETENTIOUS IMPROVEMENTS."

A PRESENT-DAY ABUSE.

MR. RICHARDSON EVANS, hon. sec. to the S.C.A.P.A., thus speaks of the Westminster Improvement Scheme in a letter to the Times: "It is agreed on both sides that the scheme must be judged by its merits, or want of merits, from what is commonly called the aesthetic point of view. Whether general convenience demands in that quarter of London huge flats and shops rather than comfortable dwelling-houses for the fairly well-to-do is disputed. It will be asserted by some that much will be destroyed which on grounds of sentiment it would have been well to preserve; and against this will be set by others the advantage of substituting wide avenues for slums which are not everywhere picturesque. About the comparative utilities in these respects I have nothing to say. I am content to deal with the claim made by the promoters that the result of their handiwork will be to create stately streets. On the other hand, I take note of the anxiety shown by their critics to insist that they shall in fact, and not in profession merely, provide for the continuation of the Embankment as a thoroughfare worthy of our splendid city and noble stream. I want to ask seriously what prospect there is that, under existing conditions, the undertaking given by the projectors of the improvement can be fulfilled or satisfaction given to the desires of their adversaries, even should these latter obtain such a modification of the plan as they doubtless contemplate? Anyone who visits, say, Ludgate Circus or Trafalgar Square (at night) will see at once what

THE INEVITABLE END

is to all these pretentious improvements. The labour of the designers, be it well or ill inspired, is promptly disguised by conversion of the façades into stations for the display of all sorts of stupendous devices intended to catch but not to please the eye. It is trifling with sense to talk gravely about architectural embellishments when the art of Architecture itself is rapidly ceasing to affect the aspect of the most important of our streets and public places. The need of the time is not so much to create as to protect; not to squander vast sums upon imposing edifices, but to enable the elements of beauty and dignity in existing city prospects to have fair play. Nothing can be better in itself or more encouraging than the efforts continuously made to save isolated points of interest from stupid destruction, but they would be more fruitful of practical good if the principle which inspires them were logically and consistently applied. In this instance there is an opportunity. When Parliamentary powers are sought for carrying out the scheme, let it be the business of every member of the House of Commons who understands what the "greatness of London" means to secure the insertion of a provision which will insure that the edifices to be constructed shall be and shall remain buildings simply, and shall not be converted at the whim of the occupant into

TOWERS OF ASSAULT UPON THE SIGHT

of those who pass by. It should be the interest of promoters to offer spontaneous guarantees to this end. A clause penalising advertising disfigurement would enable them to say with good conscience that they were presenting London with a system of boulevards, which would not only do something to promote the convenience of traffic, but would also minister to the pleasure and pride of the citizens of Westminster. Success in this isolated attempt to vindicate the amenities would furnish an eloquent object lesson, of which the moral would make itself felt in corresponding cases elsewhere. Those who think of defeating the project may do well to meditate whether, having regard to the possibility of failure on the heroic line, they ought not at least to make sure of doing lasting good by devoting some part of their energies to the furtherance of my most modest suggestion."

NOTTINGHAM COMPETITION.

CEMETERY BUILDINGS AND LAND-SCAPE GARDENING.

BY A SPECIAL COMMISSIONER.

(Continued from Vol. VI., page 547.)

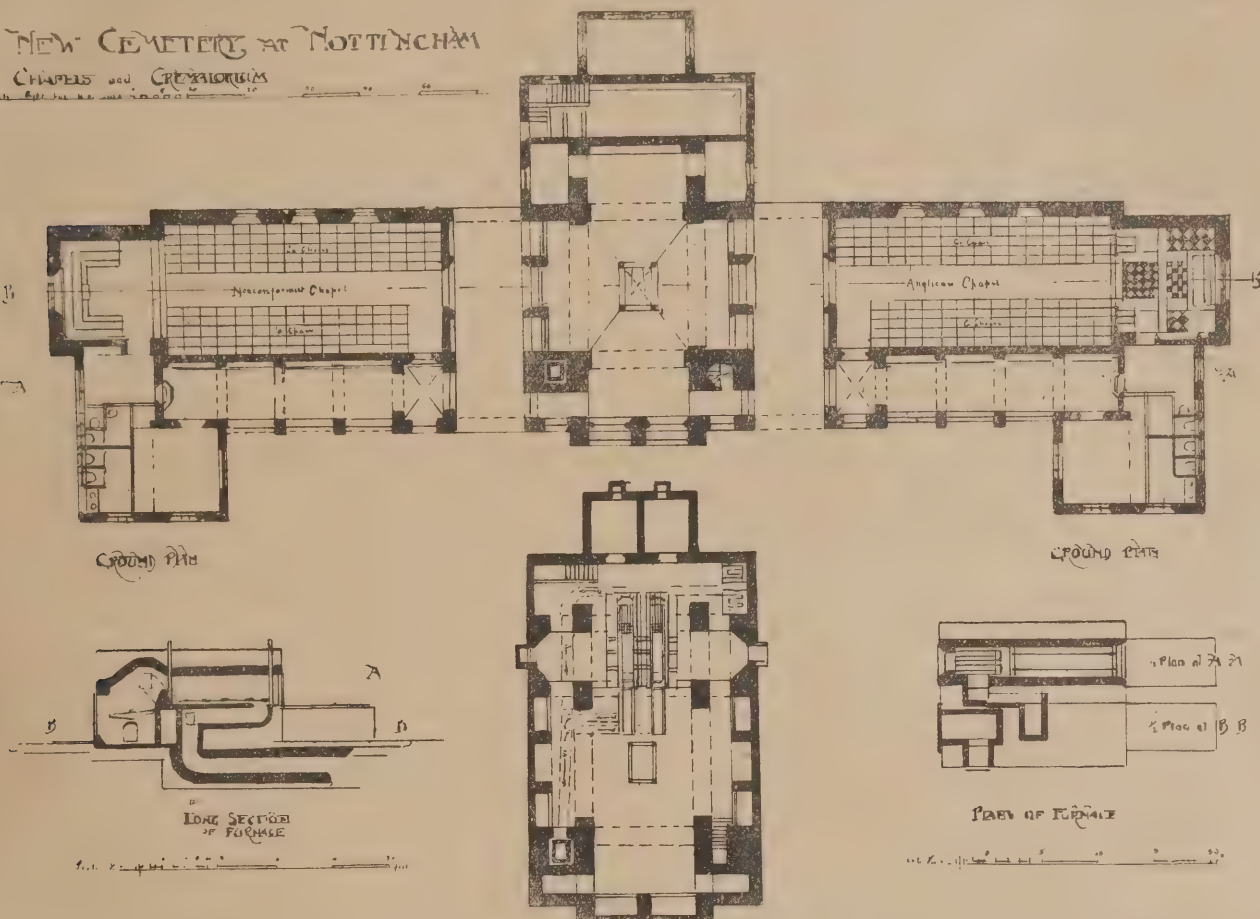

AS far as one can judge, the assessor for Competition B (i.e., the buildings) placed the plan first which he considered most suitable generally, but less as a matter of art than as a plan. The second design, however, looks as if the artistic element had caused its selection; and, of course, cost was no factor in either case, as it was ignored in the conditions.

entrance, or "bier chamber," the coffin thus arriving into the chapel by another way; (2) that the incinerating chamber is not below the buildings; (3) that the cremation hall is treated as though for a service, with a pulpit and (P) lectern. An excellent kind of cloistral columbarium is arranged, and we see no reason why access should not be given to the waiting rooms therefrom. The Dissenters' chapel is quite satisfactory, but we have much fault to find with that for the Church of England, as evidently the artists do not understand her ritual. Two heating chambers are provided—a seemingly needless expense—but are happily arranged. The domestic buildings have no very special merit, except that of reticence. The main entrance is, however, good, being simple and effective.

believe, been superseded. The entrance gates and lodges are well-designed and planned, but suggest rather the large country mansion than the crematorium. Altogether Messrs. Nicholson and Corlette are to be congratulated on a picturesque design and a very pretty set of drawings.

We now come to the vigorous design sent in by Messrs. Robson and Newberry, of Westminster, which certainly looks its purpose—as a canon of Art, a *sine quâ non*—and although it has an ambitious appearance, we believe that it works out the least expensive, the plan being decidedly simple. The authors estimate the crematorium block at £8534. A central waiting-hall is provided, top-lit, and roofed with a dome. Four low towers flank this, variously used as vestries, staircases, muni-

NEW CEMETERY AT NOTTINGHAM
CHAPELS and CREMATORIUM

NOTTINGHAM CEMETERY BUILDINGS COMPETITION. SECOND PREMIATED PLAN. BY MESSRS. NICHOLSON AND CORLETTE.

The four great difficulties with which the architects had to contend were:—

1. The modernity of the subject, and consequent difficulty in procuring information.
2. The rapid falls of the ground, even at the most suitable position on the site.
3. The absence of a clear statement as to the intended outlay.
4. The landscape gardening.

The first premiated design, by Messrs. McKewan and Dunn, of Birmingham, is shown in a neat washed perspective, and is rather attractive, but it is unconvincing from its peculiarly thin and anæmic appearance. The grouping is not unpleasing, if completely un-funereal. But we think the artists have either gone to considerable expense in unnecessary "making-up," or the levels of the ground are incorrectly suggested in the view. It is difficult, without knowing the position of the buildings on the site, to realise the lie of the land. At any rate, the hearse would have to stop twice on the side of the hill; first to deposit the coffin at the chapel, and then to take it on to the incinerating chamber. The general plan, however, merits attention. Its principal advantages over the other two, which we give as types of plans, are: (1) That, whilst the mourners are put down at their desired porch in the front, the hearse goes on to a side

The second premiated design, by Messrs. Nicholson and Corlette, of London, is decidedly charming, and their wintry perspective shows it with effect. St. Cross, Winchester, comes to one's memory instinctively, and one wishes the work were an addition to some Oxford college, for this design again partakes nowhere of the funest. In fact, these artists have shrunk from showing the one indication—the incinerator chimney—which stamps the work as that of idealists. The drive up looks about 1 in 7 or 8, and, like the first premiated design, it is difficult to see how the other levels have been treated. A large amount of "making-up" is, again, indulged in, or the levels somewhat ignored. The points in which this plan varies from the other two are: (1) two drives through, thus isolating the crematorium from the chapels; (2) a central tower (containing the chimney) over crematorium; (3) conveniences attached; (4) columbarium not good. We think the entrance tunnels in theory excellent, but in practice doubtfully so; they will always be damp and windy. The mourners' entrance is not so well arranged as in the first design, and the waiting-rooms are not so handy. We doubt the advisability, too, of making the crematorium block also the convenience for the cemetery. The apparatus shown looks like that in use at Manchester, which has, we

ment and retiring-rooms, &c., and the two chapels fit in east and west between the towers, whilst the cremation hall occupies one other side, and the great entrance the other. The weak points of this plan, which has the merit of directness and large handling, are: (1), the steps at the entrance, evidently there for the sake of economy, as the building takes the natural fall of the ground; (2), the possibility of mourners becoming mingled should two or three funerals take place simultaneously. The design is distinctly original—we can recollect nothing like it—but it is, perhaps, a little un-English. The artists, however, have a clear sense of values. Moreover, the levels here are thoroughly studied, and a funereal character has been imparted to even the entrance gates. The lodges, &c., are unpretentious, but neatly designed. These artists seem to have attempted the landscape gardening as well as the buildings, for their main block is placed in a terraced shield, thus gaining excellent columbaria to the south, a sundial, churchyard cross, &c. The grouping from the railway "comes" finely.

The winners of the landscape gardening are: (1), Mr. T. W. Mawson, of Windermere; (2), Messrs. W. Barron and Sons, of Borrowash, Derby.

WREN'S VANDALISM AT HAMPTON COURT PALACE.

MR. JOHN BELCHER'S paper read before the A.A., and published in our two last issues, provoked an interesting discussion. The President said he supposed there was no more interesting subject which could be brought before a body of architects, and no building more fascinating to them, than Hampton Court Palace. It was certainly

THE MOST INTERESTING BUILDING

in the vicinity of London. Glancing through Mr. Law's historical account of the way in which Hampton Court was erected and added to, they could more readily understand the different growths attached to the original structure, and could trace and thoroughly grasp the designs of those who carried out the work from the commencement. It was really most remarkable that one man should have had so much to do with such a large building; he referred to Cardinal Wolsey. No doubt it was to his theory and intention in carrying out so grand a building that we were indebted for the foundation of a structure which, although added to by Wren in a different style, yet presented a building of such interest, not only of the Tudor times, in which it was commenced, but of the different periods in which the additions were made. If it had been attempted in the Early Gothic days to make additions, and restore the buildings in the style prevalent when the original building was erected, we should have had, he was afraid, a building nothing like so interesting, and certainly not so grand, as Wren had made it. It was a matter of regret that funds were not forthcoming at the time to carry out the splendid scheme which Wren had put upon paper. It was an unique building not only from a structural point of view, but also on account of its colour, which was simply remarkable. All architects and artists who went to Hampton Court felt that they could not only revel in the grandeur of the building itself, but also in its colour. To understand

THE INTERNAL ARRANGEMENTS,

they wanted to be acquainted with the great Court functions carried out in those days, and especially by Cardinal Wolsey. It made one regret a little that we had gone past the days when it was possible to erect and keep up such buildings as this. We were more commonplace and matter-of-fact than the people were then. But we could see that such buildings as Hampton Court were kept in repair, and it was fortunate that now we had all these buildings well looked after by the Office of Works. It was probably a misfortune that portions of the Palace originally erected for one purpose now served another. He thought it was in the reign of one of the Georges that the building was divided up and made into residences for

noble families and others. Considering what had been done in fitting them up, it was marvellous that more mischief was not wrought from an architectural point of view; indeed, it was a wonder that the building had survived to the present day. Not long ago a fire broke out there, and it aroused the feelings of architects and others interested when they found that the building ran such a risk. It was gratifying to know that since then facilities had been given for the protection of the palace. It would be a national calamity if such a building as Hampton Court was not provided with means to cope with fire.—Mr. E. Law said it would be noticed that there was some disagreement between the lecturer and himself upon one or two topics in relation to Sir Christopher Wren, but he hoped no one would think that he (Mr. Law) was not a most enthusiastic admirer of

WREN'S WORK AT HAMPTON COURT.

He had studied the Court day after day and hour after hour, and knew every inch of it, and there they had an immense field for architects and those interested in the Art—to go there and study the detail and plan, and the whole scope of the building. It was only those who knew the buildings thoroughly that could fully appreciate the extraordinary skill and genius with which Wren accomplished his task. His remarks upon Wren were rather deprecatory of what he did to the older part of the building which he pulled down. He was sorry there was not at the time a Society for the Protection of Ancient Buildings, because then we might have had preserved to us a more interesting part than the Tudor, which Wren left standing. He regretted that Wren—or possibly his master, William III.—in adding the fine suite of rooms at Hampton Court should have destroyed the existing work, which was full of the most interesting historical reminiscences. But Wren did only a small portion of what was intended to be done had William III. lived. Had the latter lived longer probably we should have had no Tudor work left at Hampton Court. He shared in the regret that Wren did not finish the grand entrance to the Tudor Park. On

THE QUESTION OF THE CHIMNEYS,

those in the Tudor portion of the Palace were an ornament to the whole design. They grew out of the building, as it were, and the artist and architect, or whoever it might have been, had treated them in the most masterly way. In Wren's style they saw how difficult he found the task to deal with the chimneys in an adequate manner. He certainly thought they were a disfigurement, rising as they did in a scraggy way along the top of the balustrade. In conclusion, Mr. Law strongly advised architects and students to visit Hampton Court, where the facilities for study and enjoyment were unequalled.—Mr. H. H. Statham, in proposing a vote of thanks to the lecturer, said Hampton Court reminded them largely

of the history of Architecture, to be studied in a place which, perhaps, most of them had visited more as a holiday resort. He must confess that he was a Wolseyite, for he admired the Tudor part of Hampton Court more than Wren's, and wished that Wren had dealt more kindly with it. But he fully recognised that when a new sovereign came to a country and wanted a new palace to live in the question of making it comfortable for him was first considered, and, therefore, when the student was invited to admire all Wren's work, would it not be better to think of it not as Wren's, but as Architecture, and also why they admired it? There was one part of Wren's additions which he admired, however, and that was the interior

TREATMENT OF THE QUADRANGLE,

which he liked because of the bold manner in which it was treated. But when they came to the garden front he must say that, although Wren was one of the greatest architects of all the ages, if it was shown, without the prejudice attached to Wren's name, to any one of them they would say it was rather tame and flat in every respect. Coming outside to the gardens, there they had a fine lesson in laying-out the land around, and it was finer and more complete in the original plan than now. It was intended to be a regular garden of box borders with seven fountains in it. He had always thought the garden a singularly fine example of the treatment of the surroundings of a house.—Mr. W. H. Seth-Smith seconded the vote of thanks.—Mr. Percy Hunter said Hampton Court was of great interest both historically and architecturally. It was astonishing that such a mansion should have been built by a man like Wolsey, who, if tradition was true, was the son of a butcher. The most remarkable thing was that within the space of 160 years they found such an enormous development in learning generally and in the conditions of society, that a palace which was so magnificent for Wolsey and Henry VIII. was so utterly behind the age for William III. Hampton Court, therefore, only existed in its complete and original form apparently for 160 years. With regard to the alterations he certainly could not help adding his protest against

WREN'S EXTRAORDINARY VANDALISM.

It was most regrettable that he should have destroyed so much of what would have been so interesting if it had been spared. He not only pulled it down, but did not leave a record of what he destroyed. If he had left a plan of it, it would have been of great interest now. He understood there was a vague plan, but certainly no details. Architecturally, the building that mostly interested him (the speaker) was the chapel. He had tried to picture to himself what it was like before Wren touched it; or, perhaps, not then, but when it was pulled to pieces in the time of the Civil Wars. But in what condition did

NOTTINGHAM CEMETERY BUILDINGS COMPETITION. SECOND PREMIATED DRAWING. BY MESSRS. NICHOLSON AND CORLETTE.

NOTTINGHAM CEMETERY BUILDING COMPANY. MESSRS. ROBSON AND NEWBERRY.

Henry VIII. leave it? He had often wondered how the east end was finished off. It was supposed that a great oak screen, with Corinthian columns, occupied the middle covered-up space, behind which now was a large staircase, a part of the new building, but he often wondered if it consisted of a couple of large windows or one east window. Speaking of

THE IRON WORK.

Mr. Hunter expressed the opinion that it was not of one design, as had been stated, for there was an immense difference in the delicacy and refinement of the gates in the east front, leading into the gardens, and the ironwork of the King and Queen entrance, called the Lion gates. The colour used in painting the gates was most unfortunate, because it reflected the light and interfered very much with the appreciation of the delicacy of the moulded work. As to the chimneys he would advise architects, when they went to Hampton Court, to seize the opportunity to get on to the roofs. He knew no more picturesque scene, for there they got the perspective view of the old Tudor roofs. When they contrasted that view with what they would get from the Wren roofs, he did not think there would be any doubt as to the verdict upon the question of the chimneys. — Mr. Belcher briefly replied.

A SPECIAL committee of Aberdeen Town Council have resolved to recommend the erection of a Corporation slaughter-house at Central Park, Kittybrewster, at an estimated cost of about £30,000.

It has been decided to restore the ancient Norman tower of the Parish Church of St. Mary's, Dover, at a cost of £1500, to be followed by an enlargement of the church at an estimated total outlay of £6000. The tower was constructed about 800 years ago, and is a very interesting specimen of Norman Architecture.

A new pulpit, erected to the memory of the late Bishop of Wakefield in the Church of St. Mark, Noel Park (the Shropshire Mission), has been dedicated. The pulpit was designed by Mr. Rowland Plumbe, and erected by Messrs. Jones and Willis. It is of Caen stone; the panels are divided by arches supported on dark marble shafts. Under one of the arches is a figure of St. Mark, and it is proposed to fill the other spaces with figures of St. Chad and Bishop How when funds permit.

G 2

THE ARCHITECTURE OF LIVERPOOL TOWN HALL.

"IN THE STYLE OF A DOCK-WALL."

SOME amusing remarks were made at a recent meeting of the Liverpool City Council—observations which are a fair sample of the differences of opinion existing amongst the members of local government authorities when dealing with architectural subjects. Sir Thomas Hughes moved the Finance Committee's recommendation—"That the tender of Messrs. Alexander White and Sons, Duke

Street, Liverpool, for painting and decorating the whole of the rooms on the upper floor, including the grand staircase, at the Town Hall, in accordance with designs, description and specification submitted by them, for the sum of £3098 12s. 9d., be accepted, the amount to be spread over a period of four years." This was seconded by Alderman Radcliffe, who said it was the highest tender, and its amount was originally £4598, but it was discovered that much of the gold work did not need renewing, and simply required to be touched up. The designs submitted by Messrs. White were on the screen in the chamber. They had been seen and approved of by Mr. Anning Bell, of the University College, and they were undoubtedly the best submitted.—Mr. Rutherford said the Town Hall was neither large nor imposing. The style of Architecture might be called "mixed." The lower one-third was in

THE STYLE OF A DOCK WALL.

the middle portion was bastard classical, and the whole edifice was topped by a kind of imitation of the upper part of a Turkish mosque. The interior on the ground floor was inconvenient and draughty, and the tea-room for the councillors resembled an interior back yard. If the committee's proposition had been to pull down the whole building, he would have voted for it. The designs of the proposed decoration were in the Council chamber. In one of them they had dukes and duchesses dancing a minuet in two-century-old costume. If the dukes and duchesses and the elegant furniture were taken from the designs, the Council would arrive at exactly what was to be done for the £4000. He suggested that an artist be employed to make a design, and then tradesmen asked to send in tenders to carry out the work of decoration. There were at least half-a-dozen artists of reputation in Liverpool who could produce a satisfactory scheme. The decoration of the Town Hall of Liverpool ought to represent the best work of its citizens. If they wanted examples they had them in the Hotel de Ville, in Paris, and in Madox-Brown's paintings in the Town Hall of Manchester. Let them have an artistic scheme, and not merely relegate the work to decorators. Having got a design to cost, say, £3500, they could ask tradesmen to tender on a perfectly fair footing.—Mr. Burgess said that no architect or artist in England would endorse the observations of Mr. Rutherford as regards the Town Hall. Artists of note had spoken of the architectural features of the building in a very

NOTTINGHAM CEMETERY BUILDINGS COMPETITION. BY MESSRS. ROBSON AND NEWBERRY.

NOTTINGHAM CEMETERY BUILDINGS COMPETITION. BY MESSRS. ROBSON AND NEWBERRY.

different way. If the present decorations were carried out, they would last for fifty years.—Mr. R. D. Holt thought the Town Hall was

ONE OF THE PRETTIEST ARCHITECTURAL BUILDINGS

and handsomest municipal halls to be found anywhere. He felt that the style in which the hall was decorated at present was not in keeping with the architectural features of the building. It was rather of a vulgar style. The designs now submitted, he thought, were a repetition of the old style. The rooms, being rather dark, ought to be embellished by light decoration. He suggested that the Finance Committee call in an expert to advise them. The decorations should not be put into the hands of house decorators, but should be done on artistic and high-class lines.—Sir Arthur Forwood thought white and gold would be the most suitable decoration.—After further discussion, an amendment, proposed by Sir Arthur Forwood, was carried, referring the recommendation back, asking the Finance Committee to call in an expert, and authorising them to spend £4000 on the decoration, Messrs. Holt, Willink, and John Lea being requested to assist the committee in this matter.—Mr. Meade-King said it would be a mistake to tie the hands of the Finance Committee to £4000. Give the committee a sufficiently free hand that they could do something permanent, and of which the Council would be proud.—Upon the amendment being submitted as a substantive motion, it was carried by 37 to 34.

PLANS were prepared for the erection of a new church in St. Philip's parish, West Bromwich, at a cost of some £7000. A modified scheme has now, however, been approved, and by leaving out the south aisle and the vestries the cost has been reduced to £3700.

THE London County Council has confirmed a recommendation of the Building Act Committee for the erection of a new printing factory and offices on the south side of Tallis Street, Whitefriars, between John Carpenter Street and Carmelite Street, not to exceed in height the distance from the front or external wall on the opposite side of each of the streets upon which the building will abut.

METHODS OF HEATING AIR.

By W. N. TWELVETREES.

MR. W. N. TWELVETREES, M.I.Mech.E., recently read a paper on "Some Methods of Heating Air," before the Civil and Mechanical Engineers Society. The subject is one which not only frequently engages the professional attention of engineers and architects, but is of a direct personal interest to the inhabitants of this country, where varying climatic conditions render necessary considerable care in the design and installing of heating and ventilating apparatus. The paper was illustrated by numerous diagrams demonstrating the manner in which certain natural laws directly affect the questions of heating and ventilation, and showing the various systems adopted and some of the defects, frequently causing failure in practice. The most popular means of obtaining artificial warmth is

THE ORDINARY OPEN FIRE,

described by Mr. Twelvetrees as "the most cheerful, enjoyable, and wasteful form of heating appliance," in which radiant heat alone (equal to about ten per cent of the total heat of combustion) performs useful work in imparting warmth to the room and its occupants. Owing to the laws of radiant heat, the warmth so imparted is necessarily variable, inasmuch as the number of heat rays intercepted are inversely proportional to the square of the distance, and also vary in a ratio inversely proportional to the angle of incidence. Heat escaping up the chimney is not entirely wasted, as it performs useful work in promoting ventilation. Enclosed stoves, imparting heat both by radiation and contact, may communicate to an apartment as much as 90 per cent. of the total heat produced. It is important to note that due precaution must be taken to guard against overheating, which by decomposition of floating matter in the air forms deleterious compounds. It is desirable to make use of evaporating pans to provide the necessary amount of humidity. Ventilating apparatus must be arranged so as to ensure the equal distribution of warmed air. The primitive mode of ventilation, as Mr. Twelvetrees pointed out, "was simply to provide a hole in the top of a room, and this

system is still practised amongst uncivilised nations and in most of our chapels and churches." After commenting upon various modifications of this original device, the author illustrated a system arranged so as to be applicable to the requirements of both winter and summer ventilation. Having discussed the system in which stoves are employed for heating air which is afterwards distributed by conduits to the various parts of a building, the author passed on to the consideration of hot water and steam as a means of imparting heat.

THE HIGH-PRESSURE SYSTEM,

although possessing many features of excellence and convenience, is liable to unexpected increase of pressure occasionally resulting in accidents, and this risk, combined with the fact that the high temperature of the pipes tend to vitiate the air by decomposition of floating particles, somewhat militate against the more general use of the system as ordinarily employed. Under somewhat modified conditions, the employment of the high-pressure system was advocated. There is no reason, he remarked, why safety should not be insured, and the pressure kept within reasonable limits. Working pressures, varying from 10lb. to 20lb. per square inch, are frequently sufficient for all practical requirements, and in public institutions the waste heat from steam boilers may be utilised for heating the water, which is then used for washing purposes and for providing the necessary temperature in drying rooms, &c. The low-pressure system and some causes of imperfect water circulation were illustrated by diagrams and calculations. The most fertile cause of failure was attributed to want of care in estimating the height of columns necessary to provide the motive force for circulation. This cannot be arrived at by guesswork or rules of thumb methods, especially in complicated systems, as the conditions for equal lengths of pipe vary considerably in accordance with the initial and terminal temperatures and other circumstances. As exemplifying this point in a striking manner, Mr. Twelvetrees made calculations for two circuits, each with an assumed length of 500ft., in which, whilst the terminal temperatures differed by no more than 20deg. F., the necessary heights of the columns was shown to vary by as much as 19.3ft. As a means of heating steam possesses decided advantages, being readily

applied, and capable of effective control. Reference was made to the advantages to be derived from the use of exhaust steam. The use of a feed water heater, as a rule, absorbs barely one-fifth of the exhaust steam, and the other four-fifths are wasted. It is true that by using the remainder for heating purposes a certain amount of back pressure would be created in the engine, but, as the energy directly derived from an ordinary engine represents only about 25 per cent. of the thermal value of the coal, whilst 75 per cent. is contained in the exhaust steam, the drawback of the slight back pressure is more than counterbalanced by the saving effected. The gravitation system is one in which steam circulates from the boiler, returning in the form of condensed water. This arrangement has the merits of being extremely simple, and is worthy of more general attention on the part of the engineers. After treating of the employment of steam on the high pressure expansive system, Mr. Twelvetrees gave some interesting particulars relative to American practice, in connection with steam installation of a large scale for the

HEATING OF TOWNS AND CITIES.

One example given maintained in four miles of 10in. pipes and 6in. pipes, notwithstanding drafts for power and heat, along the lines. In this case remarkable precautions are taken to reduce condensation, which is less than two per cent. per mile, arrangements are also made for reducing the pressure of the supply to consumers on the most complete and approved scale. In England we have already public installations of gas and water, electricity and hydraulic power, and there seems no reason why a system of steam supply should not also be adopted. A reduction in the number of independent furnaces could not fail to exercise a beneficial effect on the atmosphere in large towns. Passing to the question of radiating surfaces, reference was made to the most suitable forms of radiator and heating coils. He deprecated the use of empirical rules as ordinarily adapted by fitters of heating appliances, and proceeded to show that the proportion of heating surface with regard to the duty required, should be calculated on a scientific basis. Having decided the mean temperature desired, the loss of heat by the building should be computed; the thermal units per hour required should then be calculated from the specific heat and

specific gravity of the air; the heat unit furnish per square foot by a given form of radiating surfaces should be ascertained by calculations, in which the chief factors are the radiant power and temperature of the material. The figures must be corrected by radio deducted from the experiments of Drelong, Pécelet, and others. It is then easy to find accurately the amount of surface requisite, and in the case of buildings exceptionally subject to cold, either by reason of situation or of defective construction, a further margin of heating surface should be provided.—The paper was followed by a discussion in which part was taken by the President (Mr. H. Covard), Mr. T. C. T. Walrond, Mr. B. B. Dadley, Mr. Brewster, Mr. Cooper Penn, and others.

The General Purposes Committee of the Blackpool Corporation have sanctioned the expenditure of £40,000 upon the extension of the electricity works.

The foundation stone has been laid of a new infectious diseases hospital which is to be erected at Sealand, about a mile from Chester, at a total cost of about £20,000.

The church of St. Mary-the-Virgin, Aldermanbury, E.C., is about to be entirely redecorated from the designs of Mr. Lewis E. G. Collins, of 31, Great St. Helen's, E.C.

The building fund in connection with the proposed new church for All Saints, Weston-super-Mare, has been started. Mr. G. F. Bodley, R.A., the architect of the reredos in St. Paul's Cathedral, is now making preliminary arrangements.

A strong organization of artists has been formed for the purpose of forming in London an exhibition, or a series of exhibitions, of "the finest Art of our time," without regard to nationality. The executive council includes the names of Mr. Whistler and Mr. Alfred Gilbert, R.A., among many others.

The Carpenters' Company has arranged the programme of the winter course of lectures, which began on Monday. They are more especially addressed to those interested in Architecture and building, and will be fully illustrated by experiments and lantern illustrations, and by diagrams, &c. The names of the lecturers are Professors Silvanus Thompson, Banister Fletcher, T. Roger Smith, Mr. Lewis F. Day, and Dr. Longstaff. Sir John Lubbock and Sir Arthur Blomfield have consented to preside on two evenings.

KEYSTONES.

A new mission chapel has been erected at Thorverton, Devonshire.

A STAINED-GLASS WINDOW has been erected in St. Mark's Church, Sheffield, to the memory of the late vicar, Archdeacon Favell.

PLANS have been prepared for the new concert and recreation hall at West Kirby. The architect is Mr. Edmund War.

THE British Archaeological Association will hold its next summer meeting at Peterborough. The proceedings commence on the 14th of July.

THE Watch Committee of the Halifax Corporation have accepted tenders for the erection of a new court-house and police-station on the site of the old infirmary in Harrison Road. The total estimated cost of the building is £12,734 3s. 3d.

THE Gas Committee of the Birmingham Corporation recommend an outlay of £336,000 for the reconstruction of existing works and the provision of additional works, capable, when the alterations and extensions are finished, of providing an extra supply of 10,000,000 cubic feet of gas per day.

PLANS have been approved for the erection of a block of shops and houses at Dysart, Scotland. The elevation is in the Scotch baronial style, of which there are many old examples in Dysart, and, with the projecting bar-windows and cross-stepped gables, will make a decided improvement to the street Architecture. The architects are Messrs. A. and A. C. Dewar, Leven.

It is stated that it has been decided to hold at Earl's Court, from May to October next, a universal exhibition, intended to illustrate the inventions, industries, manufactures, and applied arts of today. An endeavour will be made to render it international in its scope, and sections have been devoted to France, Germany, Russia, Austria, Hungary, Switzerland, Turkey, Bosnia, and the United States.

For some time the platforms at Dundee Tay Bridge Station have been found inadequate, and to meet growing requirements extensions have been determined on. Plans for these have been prepared, and as soon as certain necessary arrangements are completed the work will be proceeded with. It is proposed to extend the platforms on each side of the "dock" a distance of about 40yds. to the westward.

NOTTINGHAM CEMETERY BUILDINGS COMPETITION. BY MESSRS. ROBSON AND NEWBERRY.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
February 23rd, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE Bootle Town Council has accepted the report of the referee upon the competitive plans for the new fire station. Mr. C. J. Anderson, 36, Dale Street, Bootle, who designed the new police-court buildings, receives the first award, and Messrs. Briggs and Wolstenholme, 3, Lord Street, Liverpool, the second.

THE trustees of the Birmingham Church Fund have decided to invite a limited number of architects to compete for the erection of a new church in the parish of Sparkbrook, in place of Christ Church, Birmingham. They have appointed Sir Arthur Blomfield, A.R.A., assessor, and the following have been invited to compete:—Messrs. Bateman and Bateman, W. H. Bidlake, J. A. Chatwin, R. Creed, John Douglas, Wm. Henman, H. E. Lavender, M. Macartney, Edward Mansell, Temple Moore, F. B. Osborn, and T. F. Proud. Nine of the twelve invited architects practice their Profession, and the others are men of special position in connection with ecclesiastical work.

THE designs submitted by Mr. Jackson, R.A., and Mr. Brock, R.A., for the Benson Monument in Canterbury Cathedral, having been accepted by the committee of the Memorial fund, the two Academicians have begun the execution of the work. Good progress with it, indeed, has already been made, especially in the main structure, which part of the commission is in the hands of Mr. Jackson. Those who have seen the designs say that the memorial will be an imposing structure. The recumbent effigy of the late Primate, which is being done by Mr. Brock, will represent him in an attitude of prayer.

At a recent meeting of the Barnsley Town Council the plans of the proposed new opera house, to be erected in Eldon Street, were approved. The plans, which have been prepared by Mr. John P. Briggs, of 1, Arundel Street, Strand, London, show an imposing building of stone. The site is a particularly good one, and allows of three sides open to the roadway. Seating accommodation has been provided for 1400. The theatre will be fire-proof throughout, and provided with electric light. The whole of the auditorium, entrances, saloons, and dressing-rooms will be heated by hot water. The important subject of ventilation has been carefully considered, and several new and novel features have been added.

THE Admiralty has decided to make an important extension to the Royal Naval Barracks, Devonport, by the erection of the officer's quarters and other buildings for 1000

officers and men, thus enlarging the barracks to twice their present dimensions. The Admiralty has accepted the tenders of Messrs. Matcham and Co., Plymouth, who constructed the present barracks fifteen years ago. The outlay, including the furnishing of officers' quarters and a handsome mess hall and fitting up quarters for seamen and stokers, will amount to a quarter of a million sterling. The work is to be completed in three years.

A MOVEMENT is on foot to restore the crooked spire of Chesterfield Church. In January there were some boisterous winds, and snap in two went a stay, which, apparently, was of as sound wood as need be. The steeple has undergone a thorough inspection by Mr. Temple Moore, of London, who, in a report, says:—"No structural repairs of importance have been done to the spire within the memory of anyone living, and the recent accident (in which an important timber was broken and forced out of position) is quite sufficient to show that it is impossible to place any reliance upon many of the timbers, and that it is imperative that the work of overhauling and restoring the spire should be undertaken at once, or it should be taken down."

THE huge advertisement boards elevated on posts which disfigure the fields and woodlands bordering the railways are bad enough to the æsthetic sense, but there is a worse terror in store—the advertising windmill, a specimen of which is now being erected in a meadow near a North London junction. The windmill is substantially constructed of wood and iron, and is painfully permanent in appearance. Long arms project at convenient elevations from the centre pole, which is about 30ft. in height, and to these are attached highly-coloured advertisement boards, 8ft. or 10ft. square, and slightly curved to catch the wind.

MR. G. A. T. MIDDLETON has selected the Hartz district of Germany for his annual Continental sketching tour this Easter. The district is by no means so well known to English architects as it deserves to be, lying just aside from the main route to Berlin, and full of most interesting work which is frequently compared with that of Nuremberg and other Bavarian towns. The party is to start from England on April 6th, and to be absent for ten days, the cost, ten guineas, being by no means excessive considering the distance to be travelled, and the high educational value of such a tour taken in the company of experienced draughtsmen. We are hoping to give a series of illustrated articles descriptive of the places visited when the tour is over, and should be glad to receive line tracings of sketches made by any members of the party, from which to select illustrations. Mr. Middleton having promised to place any sketches which he may make at our disposal for the purpose, and to contribute the letterpress. A party of at least thirty will be needed this year to make the event a financial success, no rebate on the ordinary railway fare being obtainable for a lesser number. Places are already booked for a small party of those who have taken part in former tours, and no doubt the desired thirty will soon be secured.

THE London County Council, at its meeting last week, received a report on the proposed new Vauxhall Bridge. Since the last design for a steel-arched bridge was rejected in July, 1897, the chief engineer has given the subject his unremitting attention, and has endeavoured, within the limits imposed upon him by the estimate, to meet the views of all parties by preparing a design which will give, as far as can be expected, general satisfaction. After mature deliberation and a visit to similar structures on the Continent, and conferring with the engineers engaged in their construction, he has prepared a design embodying the principle on which his predecessor constructed the Thames embankments, namely, a granite bridge backed with concrete. If this is adopted the structure will have the appearance of a granite bridge, and it will be possible to erect it like Waterloo or London Bridge. Moreover,

the heaviest loads will be able to pass over it, and the annual expense of painting will be saved, resulting in an economy of at least £1000 per annum. The structure will also be practically permanent. Similar bridges have been constructed over the Danube, the Neckar, and the Rhone, with equal spans to, if not larger spans than, those proposed at Vauxhall, and have been tested in the most severe manner by passing over them locomotive engines weighing as much as 78 tons. In recommending the Council to approve this design, the Bridges Committee stated that at present it was proposed that the bridge should be faced with red and grey granite of various tints in such a manner as to bring out the features of the work in pleasing relief. The bronze lamp fittings and the designs for the top or finials of the columns were indicated in a general way upon the sketches, but might be modified if the general structure was approved by the Council. An amount had been set aside for the ornamentation of the bridge. They, however, did not propose to leave the pedestals unfilled, but intended to deal with the matter and to report upon it after the Council had approved of the general design. In deliberating upon the subject they had had the benefit of the advice of those gentlemen who objected to the proposed steel arch bridge, and in presenting the present design they believed that if the bridge were constructed in accordance therewith it would prove to be one of the handsomest bridges over the Thames. The Parliamentary estimate for the cost of the bridge was £380,000. By the adoption of the present design some £20,000 would be saved.—The consideration of the report was adjourned.

THE London County Council has considered a report from the manager of the Works Department, containing a return of completed works not yet reported to the Council and of works in progress. Of the works commenced during the late management and completed in 1897, but not yet measured, it was reported that the original estimate was £3375, and the actual cost, subject to audit, £4018 1s. 9d. The works commenced during the late management and still in progress were originally estimated at £166,948 16s. 11d., while the total expenditure and liabilities incurred to December 31st last amounted to £162,501 17s. 5d. Works commenced and completed during the new management were estimated to cost £4923, and the actual cost, subject to audit, was reported to be £3434 7s. 8d. The original estimate of works commenced during the new management and still in progress was £97,414, and the actual cost and liabilities incurred to December 31st last was £37,389 9s. 6d. The concluding table in the manager's report dealt with works completed, certified, and ready for inclusion in the next half-yearly statement. The original estimate of these works was £16,066 16s. 8d., the revised estimate £13,788 17s. 10d., and the actual cost £10,438 19s. 9d., showing a cost below estimate of £3349 18s. 1d.—Lord Onslow moved an amendment for the reception of the report with the exception of a clause containing the works manager's statement. The proposition was rejected, and the report adopted.

"THE Cost of Building Forty Years Ago and Now," was the subject of a paper recently read before the Architectural Section of the Philosophical Society of Glasgow, by Mr. George Eadie. Mr. Eadie took two tenements of 35ft. 6in. frontage, four stories high, consisting of three houses on each stairhead, two room-and-kitchen houses, and one of a single apartment, and compared what it would take to erect these houses now against what it cost forty years ago. Such tenements' brickwork, in 1857, would cost £953 9s. 4d., and in 1897 they would cost £1310 7s. 10d. In 1857 the wright work would cost £826 17s. 6d., against £868 18s. in 1897; slate work, £38 16s. 2d., against £49 7s. 8d.; plumbing and gas work, £141 19s., against £117 12s. 8d.; plaster work, £168, against £240 12s. 10d.; smith work, £25, bells, £20, street and sewer work, £35—total £74, against £80. Such tenements forty years ago would cost £2273 18s., while to-day they would cost £2751 7s. That was an increase of

21 per cent. Wages had doubled within forty years, while materials had increased 58 per cent. A house which was rented forty years ago at £8 15s. now fetched £10 15s. Forty years ago two rooms and kitchen houses brought £15, now they realised £22; forty years ago three rooms and kitchen houses brought £24, and to-day they realised £28. In erecting a building to-day there were the building regulations to be taken into consideration, while the modern improvements, such as electric bells, register grates, hot and cold water, etc., meant extra money, which was not expended forty years ago.

MR. ONSLOW FORD seems to have been most unfortunate with the blocks of marble obtained by him from Italy for the statue of Huxley, commissioned by the Memorial Committee. The work was put in hand a year ago, and after it had been proceeded with for some time a blue vein was discovered in the marble, with the result that it had to be discarded and a fresh block ordered. This also proved to be unsound, and the sculptor has therefore had to await a third piece from Italy. Of course, there is now no chance of the statue being seen in the Royal Academy this summer, and it will probably be at least two years before the monument is placed in its final position in the Natural History Museum at South Kensington.

THE knucklebone order of Classic Architecture is not recognised in orthodox works, and is probably unknown to most people. But it may be found in the little village of Cley-on-Sea, on the north coast of Norfolk. Most of the walls are built of flint cobble stones, but on the cornices of one or two of the houses various bones of sheep have been introduced with a very quaint and not unpleasing effect. The knucklebones in one case are a sort of classic ornament under a projecting cornice, and in another case they are arranged round a panel of cobble stones embedded in cement. The appropriate title of Knucklebone Hill is locally given to these bone-decorated houses.

MR. G. F. BODLEY, of Messrs. Bodley and Garner, architects, who are engaged upon the restoration work now in progress at Stratford-on-Avon Parish Church, visited Stratford a few days ago for the purpose of meeting the committee at the church. The work had been at a standstill at one spot for some days, pending Mr. Bodley's arrival, owing to an interesting discovery. This was where a new arch is being constructed between the south transept and the south aisle for the purpose of carrying the organ pipes through. As the workmen were engaged in removing the solid stone wall, the arch being 13ft. wide, they lighted upon an Early English lancet window embedded in the wall. A portion of the moulding had been removed for the purpose of bringing the wall to a level surface, and all traces of the window were concealed by the overlying cement. The history of the rest of the building makes the origin of the window quite clear. It was evidently once a light from the outside into the transept, this portion of the church being older than the aisle, and when the latter was built the window became unnecessary and was accordingly filled up. The window has been covered up between 500 and 600 years, and was a thing of the past centuries before Shakespeare came to be christened.

THE Globe's Venice correspondent writes: "The Castello of Udine, a great, square, ugly building of three centuries ago, now used as barracks and civil prisons, stands on the site of the ancient castle, on a great mound of earth thrown up, tradition and Bædeker tells us, by Attila, whence he could watch at his ease the burning of Aquileia. The other day it was found necessary to repair a part of the foundations of an inner wing. On the flooring being removed, the workmen came upon a small, massive, tight fitting stone trap-door. It was raised with difficulty, and it disclosed, as in romances, a flight of steps. On going down it with lights, the workmen found themselves in a subterranean chamber. From one corner of

this ran a passage, in the walls of which were five low narrow doorways, opening into the most horrible prison-cells imaginable. The doorways still held the heavy iron hinges, which had supported enormously thick doors, as shown by the depth of the stone framework. At the end of the passage two other cells were found, suggestive of still more deadly suffering; for, while the others are of ordinary size, these only measure 2ft. 4in. by 2ft. 8in.—a size that made it impossible for the unhappy wretches confined in them to lay down.

THE Bluecoat School in Palmer Street, Westminster, is now a school no longer; but the old building, in the Wren style, erected in 1709, has been purchased by the Westminster Vestry, and will in future provide additional accommodation for the staff, and at the same time the space around the building will allow of a much-needed widening of James Street. In this connection the vestry has issued a notice in which they say that, "while declining to bind themselves to preserve the said building," they will "endeavour to do so if circumstances permit." This is one of the rare instances in which any official body has thought fit to consider for a single moment the claims for existence of a picturesque old building.

THE Lord Provost's Committee of Edinburgh Town Council has had under consideration the scheme for the reconstruction of North Bridge Street. As the result, it was decided that the ground should be exposed to auction in five lots—the west side of the street in two lots, and the east side in three. It was further remitted to the town clerk, with a small advising sub-committee, to bring up a report as to the method in which the gross upset price of £230,000 should be allocated over the five lots.

A REPORT has been prepared by Mr. C. C. Lindsay, M.Inst. C.E., and presented to the members of Glasgow Corporation, on the proposal to bridge Glasgow Harbour at a point below the new Broomielaw Bridge. Mr. Lindsay submitted particulars of a semi-high-level viaduct at Hydepark Street, with two alternative low-level bridges at Finnieston Street or at West Street. The estimated cost of the high-level viaduct and approaches, exclusive of the cost of property or the way-leave required, would be £200,000, while the estimate for a low-level bridge, also exclusive of property and way-leave, would be £109,000. Further consideration of the scheme has been postponed.

ON the occasion of her second lecture of the course on "Delphi" Miss Harrison, at the Passmore Edwards' Settlement, showed the famous bronze charioteer, and stated that it was 1'8 metres in height—i.e., about life-size—and that it was found under a Roman conduit in a square building above the temple of Apollo. It probably owed its fine state of preservation to the fact that it was concealed under the debris of an earthquake in the fourth century B.C., the same earthquake as that which destroyed the temple of the Alcmaeonidae. The sacred temenos of Apollo was next examined. It occupied an area of 20,000 square metres—i.e., between four and five acres; the peribolos wall is in part intact, and, as the angles are preserved, can be clearly made out. It is in part of polygonal, in part of "Hellenic," masonry. The principal landmarks within the precinct are the great temple of Apollo with the altar at the east front, the theatre, the Lesche of Cnidus (in which were the famous frescoes of Polygnotus), the fountain of Cassotis, the portico and treasury of the Athenians (in which last was found the hymn with the musical notation), and the treasures of other cities, notably of Sicyon and Cnidus. These, together with the course of the Sacred Way, the pavement of which is still preserved, enabled us to follow in great part the periegesis of Pausanias. Immediately on entering the precinct Pausanias noted the votive offering of the Lacedæmonians after the battle of Ægospotami. Of this the basis

and many of the inscriptions are preserved, though the statues were probably carried off by Constantine. Pausanias noted no fewer than thirty-eight of these statues by name, and all were the work of artists of high repute. Plutarch also, in his dialogue on the Pythion Responses, said of a distinguished visitor to Delphi, that, weary though he was of the guides and their long-winded tales, he was deeply impressed by the sea-blue patina of these statues of the admirals, which made them look as if they stood "ocean deep." Passing through a perfect forest of votive bronzes Pausanias arrived at the two treasuries of Sicyon and Cnidus.

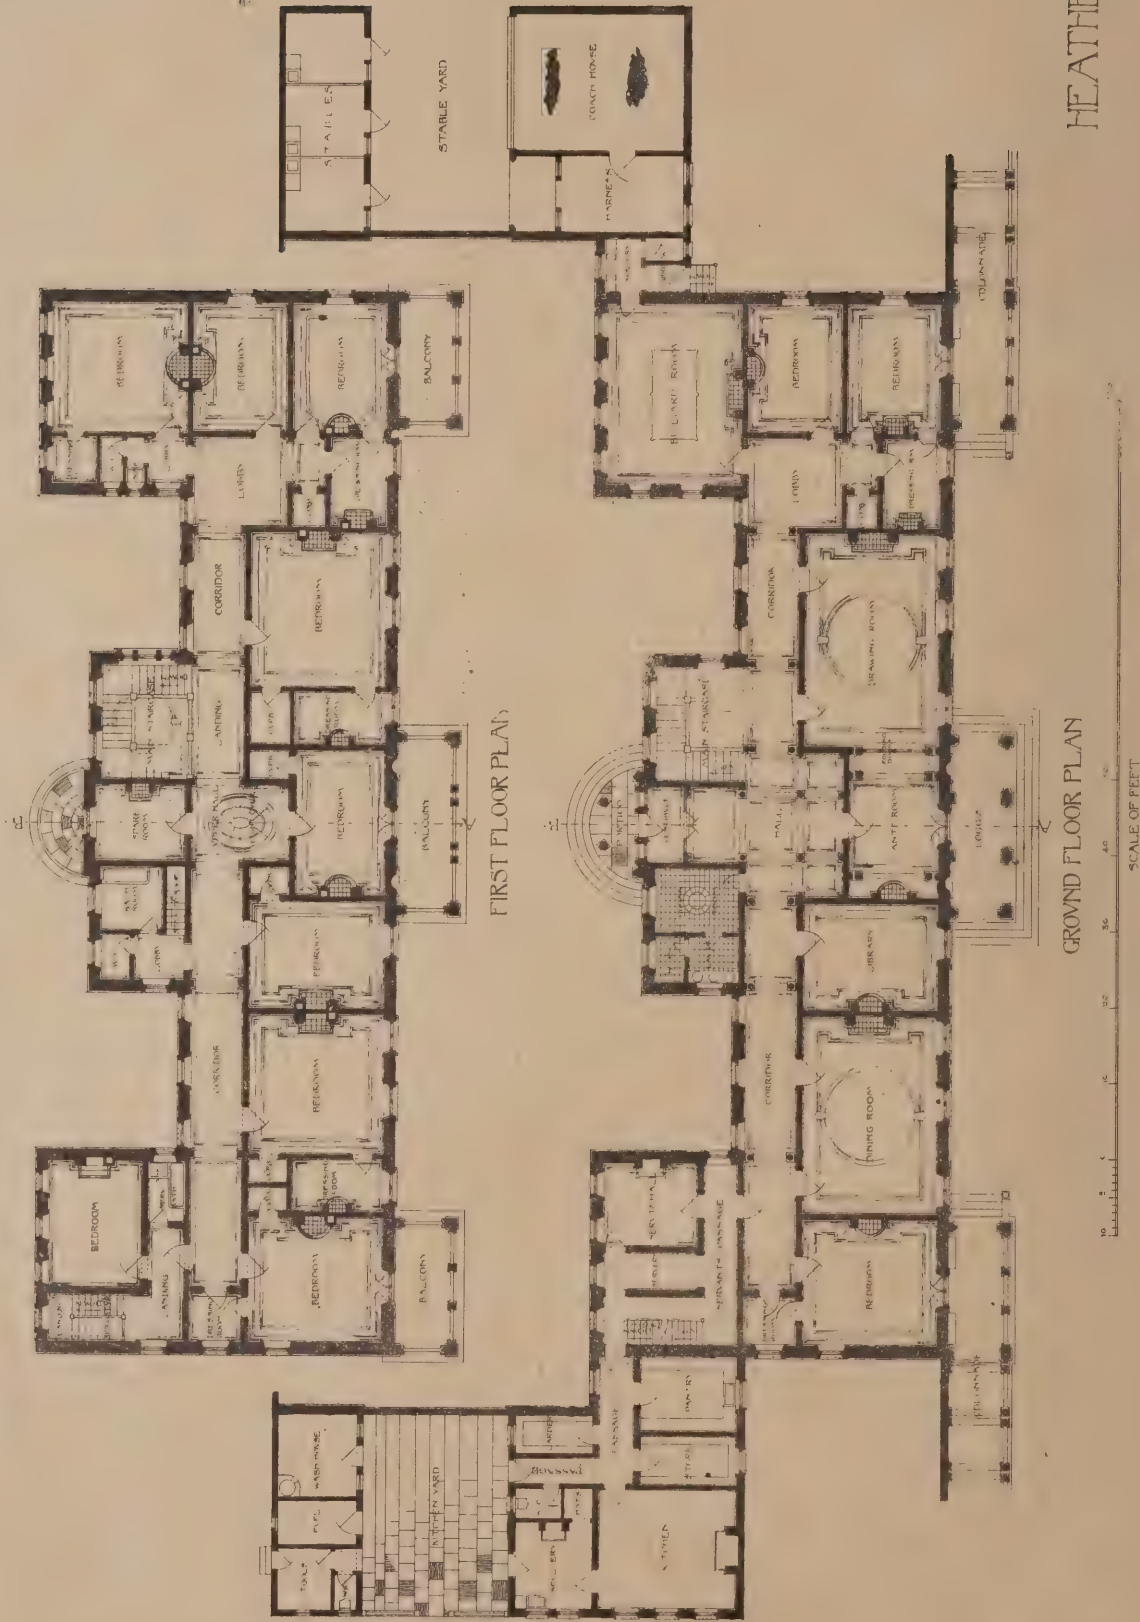

THE work of restoring the spire and turrets of Salisbury Cathedral, which has been in progress during the past two years, is now almost completed, and it is expected that in the course of the next few weeks it will be entirely finished, and the scaffolding, which at the present time envelops the tower and a large portion of the spire, will be removed. The committee, consisting of the Dean and Chapter of Salisbury, and the leading laity in the diocese, have been actively engaged in arranging for the tower and spire to be made safe for future generations, and to preserve in its integrity this beautiful example of cathedral Architecture. The work has been carried out under the direction of Sir A. Blomfield, and in a recent report to the committee he informed them that the turret at the north-west of the cathedral was in such a bad state that it was needful to take it down. It has been rebuilt. The work, Sir A. Blomfield said, was one of great difficulty, but it has been accomplished in the most workmanlike and satisfactory manner. Every stone that could be reused appears again in its proper place, only new stones being introduced wherever the original stonework has been crushed, broken, or in such small stones as to be unsafe. The turret staircases at the four angles of the tower, which have to support so much of the enormous thrust of the spire, have been thoroughly repaired and strengthened. On all four sides defective masonry has been taken out and replaced by new stones weighing in some cases upwards of a ton. The foundations of the south aisle and of the west side of the south transept have yet to be repaired. Altogether the cost of the work will be about £15,000.

At a meeting of the Ludlow Town Council, Mr. Lear said he had seen an article maintaining that the oil painting in the Council Chamber which had been restored was after all a portrait of James II. He should like to know who it really represented. Mr. Tyrrell said he had seen several pictures of William III., and the nose on the picture was William's. James II. had a flat nose. The Mayor remarked that there was a resolution on the books that it was William III., and until it was proved otherwise it must remain so. Alderman Smith suggested inscribing the name William III. on the back, and that of James II. on the front. Mr. Tyrrell pointed out that the cleaning had changed the monarch from James II. to William III. Amidst laughter it was decided to stick to William III.

THE London Technical Education Board has made a special grant of £1000 towards the erection of the new workshops for masons' and plasterers' classes, which are to form part of the buildings associated with the great hall of the Battersea Polytechnic. The buildings are to be proceeded with at once. The hall is designed to seat about 1000 persons, and the estimated cost is £6500.

"T. E. W." writes to suggest that Mr. Thomas Thornycroft's Boadicea "could not be better placed than on the top of the middle gate entrance at Hyde Park Corner. It would then be, to a certain extent, out of sight of all imperfections, according to Mr. Harry Quilter's ideas. The gates on either side might, in time, find contributions in keeping, and thus make Hyde Park Corner somewhat more artistic."

H. E. A. THER

THE annual exhibition of water-colour drawings in the gallery in Old Bond Street is always one of the most agreeable shows of the year. In the exhibition now open Messrs. Agnew have made an innovation which greatly increases the attractiveness of the collection. They have covered a screen with a number of beautiful miniatures, most of which will be recognised as having belonged to the celebrated collection shown by the late Mr. Edward Joseph at the Burlington Fine Arts Club in 1889. The water-colours include drawings by Turner, David Cox, De Wint, Copley Fielding, Sir A. W. Callcott, and William Hunt; by Frederick Walker, D. G. Rossetti, Sir E. Burne-Jones, Mr. Alma Tadema, and Miss Mary Gow; by Fortuny and Edouard Détaillé. These are a few out of many. We might add to them landscapes by that delightful artist of the pre-Turner days, J. R. Cozens, by Alfred Hunt, and G. P. Boyce.

It is proposed to build a church for 700 persons in the parish of St. James, New Brighton, to replace the temporary building at Upper Brighton, and £3000 is already available towards the cost. Another proposal is the erection of an additional church in St. John's parish, Egremont, at the bottom of Trafalgar Road, overlooking the river, the site for which has been secured. Other items in the proposed extension movement are a new church in the Wallasey parish; a new church for St. Mary's, Liscard, to replace the old mission house in the village; enlarged mission rooms in St. Paul's parish, Seacombe; and a new church in Poulton Road.

THE thirty-seventh annual exhibition of the Royal Glasgow Fine Art Institute contains a great variety of good work, and includes pictures by Reynolds, Landseer, 'Isaiah', Orchardson, Millais, Corot, and James Maris. A notable feature of the exhibition is the display of portraits. Whistler's "Lady in Fur Jacket" is a prominent work, and Graham Robertson has an artistic decorative portrait of Mrs. Patrick Campbell. In the water-colour gallery works by J. M. Swan, the late Stacy Marks, Clara Montalba, C. Walton, and J. G. Laing adorn the walls. There are also sculpture and architectural galleries.

FOR some time past the church of St. Peter's, at Barton-on-Humber, with its old Saxon tower, reputed to be one of the oldest churches in the kingdom, has been undergoing the process of restoration. Recently an interesting discovery was made. There is a very curious little building on the west side of the Saxon tower, which has been rather puzzling to the many antiquarians who annually visit the church. Permission was obtained from the vicar and churchwardens to investigate, and accordingly Professor Brown, of Edinburgh, in company with Mr. C. H. Fowler (Durham) superintended excavation on the east side of the tower. After digging about 4ft., they found indications of a similar building to that on the west side of the tower. The foundations are about 16ft. square, and go to prove that the old tower stood in the middle of these two buildings. One could almost imagine that it was used as a place of defence as much, if not more, than as a place of religion. That it was occupied by armed men in very early days is ascertained from the evidence gathered from various stones in the building, which show the marks where the archers sharpened their arrows.

A REMARKABLE building is in process of erection on a plot of ground in Carr's Lane, Birmingham, which for a quarter of a century has remained unoccupied. Three feet beneath the surface of the ground there runs a tunnel of the Great Western Railway, and as the tunnel could not with safety bear more weight than it now does, all plans for building on the ground have been condemned by the city surveyor and the railway engineer in consultation. By an ingenious device, however, an architect has now prepared plans whereby a three-story building is to be erected on the site. Twenty-five feet of building will have to project over the tunnel, and as no weight is to

rest on the tunnel, this has to be erected on huge cantilevers. These cantilevers, six in number, run to a depth of 6ft., and are estimated to carry weights varying from 100 to 400 tons. The A cantilever supports the greatest weight, estimated at 400 tons, and is calculated to support a strain of 875 tons. The A1 cantilever will support 375 tons of the building, while only 19ft. of it under the building will rest upon a solid foundation. To add to the safety, from this hangs a mass of concrete, 16ft. across by 15ft. high, and weighing 160 tons, suspended by steel bars 22ft. long. The whole thing resembles the weighing of a carcass on a butcher's steelyard; the cantilever acts as the steelyard, the warehouses and the shops are supported at the long ends, and the great weight of concrete hangs from the short one, acting as a counterpoise, while the cantilever rests upon a bed of concrete.

THE rebuilding of the Old Bailey is to be put in hand at an early date. The City Lands Committee have had a conference with the Home Secretary to secure his final approval of the plans and details of the reconstruction. It is not intended to make any alteration in the prison part of the Old Bailey. The rebuilding will be confined entirely to the Sessions House, which has for many years been totally inadequate as a court-house. The delay that has occurred is not due to the Lands Committee, who control all the buildings and property both in and outside the City that belong to the Corporation. The plans of the new Sessions House were long ago submitted to the Home Secretary and approved of by him, and then, as an act of courtesy, laid before the judges who sit at the Old Bailey. Here it was the delays occurred, on account of the number of alterations in the plans desired by some of the judges. But now it is understood the plans have been approved by all those interested.

By a curious coincidence, the two engineers who will advise upon and superintend the structural alterations that are to be made in the event of the new Crystal Palace proposals taking effect are sons of two men who were largely concerned with the fortunes of the Palace in its earliest days. Sir Charles Fox was the engineer who designed the building when it was originally erected in Hyde Park, while Mr. John Douglas Cooper arranged its sale to the original Company and its removal to Sydenham Hill. Sir Douglas Fox and Mr. V. B. D. Cooper have now been called in, not on account of their family associations with the Palace, but, by an interesting coincidence, to take in hand the structure with which their father's names were so closely connected.

THE annual distribution of prizes, &c., to the successful students of the Royal Female School of Art, took place recently at Merchant Taylors' Hall, the awards being presented by Lord Ronald Sutherland Gower. The Rev. Prebendary Whittington read the 37th annual report, in which the committee tendered their grateful thanks to the Queen for her Majesty's continual support to the school, and for the encouragement given to the students by her purchase this year of a study from life by Eveline M. J. Howell, which obtained the Queen's gold medal, and a design by Bertha Smith, which obtained a national silver medal at the annual examination and award of prizes at South Kensington. During the past year 122 students had received instruction in Art. On April 1st last 469 works were sent to South Kensington for examination and competition for awards. The number of works sent up for examination for national competition was as follows:—50,255 from 281 schools of art and branch schools, 35,560 from 298 science schools, and 11,796 from 449 art classes. Of these 5853 were selected for national competition. The Queen's scholarship was awarded to Mary F. Bill, the Mercers' scholarship to Ethel M. Mullins, the Clothworkers' scholarship to Eveline M. J. Howell, the William Atkinson scholarship to Mildred Jackson, the Brightwen scholarship to Rosamond Watson, and the National Gilchrist scholarship to Marianne

Edwards. The meeting was addressed by Mr. R. T. Pritchett, the Rev. Sydney Probert, Dr. Phené (Clothworkers' Company), Mr. George Baker (Merchant Taylors' Company), Mr. L. J. Carlidge, Mr. E. Phené Spiers, Mr. C. Foster Hayward, and Dr. Garnett.

WOLVERHAMPTON has resolved to have a new coat of arms. It has been discovered that the present armorial bearings of the town do not represent true heraldry, and are unauthorised by the College of Arms. The Council has decided to ask "That a memorial be addressed to the Earl-Marshal of England, praying him to issue his warrant to the Kings at Arms for their granting and assigning such arms and crests as may be proper to be borne by the corporation and their successors according to the laws of arms." The fees for the new insignia are set down at £76 10s. The motto of the town, "E tenebris oritur lux" ("From darkness light arises"), is appropriate to its present awakening.

WINTER by winter London has been steadily growing darker, and the cause of the mischief increases annually. It is not the clouds, but the smoke. The result is that many painters are leaving town, or, while retaining their London houses, are doing their work in the country. Portrait-painters, of course, must have their headquarters in town—the others have their studios out of London. We shall have no more palaces built with studios in the art districts. For, strangely enough, the art districts are the very ones that suffer most. When Melbury Road was colonised, the light was good. When Holl and Pettie carried a little northward, up to Fitzjohn's Avenue, the tradition which in the sixties treated St. John's Wood as pre-eminently the artists' quarter, dark days, one steadily succeeding another, were not dreamt of. But now Hampstead itself is as dark in winter as Bayswater, and Kensington as gloomy as Knightsbridge. The number of large houses with studios grows on the agents' hands year after year, not because more are built, but because few are let.

THE Rev. F. W. G. Wix, vicar of St. James's the Great, Bethnal Green, in appealing for £4000 with which to carry out necessary work of restoration, says: "The church is practically unfit for Divine service. There are great holes in the roof—the stonework will have to be renewed—and such things as lead work, pipes and gutters, &c., are either gone or broken. Internally the plaster has fallen down from the ceilings—damp and mould disfigure the walls—a heating apparatus must be supplied, and considerable alterations in the arrangements will have to be carried out."

CHICAGO appears to possess in Henry H. Engelhardt an artist before whose rapidity of production the achievements of the Langham Sketching Club must pale into insignificance. He paints entirely from memory, and devotes the whole of his genius to landscapes in oil. A picture 22in. by 10in. is completed in nine minutes, while a smaller one can be conjured into existence in three minutes, and he works from ten to seventeen hours a day. According to a writer in an American newspaper, this prodigy recently undertook, for a wager, to paint 150 landscapes in nine hours, and actually completed 152, all of them "marvellously clever paintings." After this we are not surprised to learn that he claims to be "the champion catch-as-catch-can painter of the universe." His pictures range in price from 75 cents upwards; but, being overwhelmed with orders from picture-dealers, he threatens to raise the price of his higher-class paintings to 24 dollars a dozen. "I must do something to protect myself," he says, "against these fellows who have gone mad over Art. There is no passion more dangerous and absorbing, and unless it is checked harm is liable to come of it." What becomes of these gems of Art after they leave his hand he does not know, but he "opines that they are given signatures of some more or less celebrated man and are sold at prices several hundred times greater than their original cost."

Surveying & Sanitary SUPPLEMENT.

FEBRUARY 23RD, 1898.

POLICE STATIONS AND PRISONS.

By GEORGE H. BIBBY, F.R.I.B.A.

IV.—RESIDENCES FOR CONSTABLES. (Continued from Vol. VI., page xlvii.)

IN former times the gatehouses or bars of fortified cities frequently contained apartments for the accommodation of the watchmen or police of the period, and even so late as thirty years ago this custom survived at York, where the bars of the city remained in habitable condition, and where it is not unlikely they may still be so occupied. Some of these bars contained apartments on two or three floors above the gateway, and have afforded sufficient accommodation in modern times for a constable and his family. The areas of the windows of these buildings were usually larger on the city side of the walls, and not mere slits in the walls, as is the case at Micklegate Bar, York. It may be noted that the two doors shown high on the frontage were to give access to outworks, long since removed.

The police of the Metropolis formerly were composed of the aldermen, councilmen, constables, and others connected with the various wards, and these acted as night-watchmen in turn. This arrangement of police is said to have been continued from a very early period, with modifications from time to time, and until the formation of the modern police system. John Timbs, upon this subject, wrote as follows: "In the metropolitan parishes without the City the watch was chiefly under local acts, the establishment in each consisting of a beadle, constables, and generally head boroughs, street-keepers, and watchmen, as in the several wards of the City, but working to a result much worse, the petty constables being served by deputies, in many instances characters of the worst and lowest description, having no salary, but living by extortion, and countenancing all species of vice. To abolish such a system Sir Robert Peel's Metropolitan Police Act of the 10th George IV., ch. 44, was passed, superseding the Bow Street foot patrol, and the whole of the parochial police and watch outside the city, by one force for day and night duty." The horse patrol was added in 1836, and the Thames Police in 1838, when the old detective force was superseded.

Another gatehouse prison was built in the time of Edward III. as the principal approach to the monastery at Westminster. It stood at the western entrance of Tothill Street, and consisted of two gates, the southern leading out of Great Dean's Yard, and used as a lodging for felons. On the east side was the Bishop of London's prison for "clerks-convict." The rooms over the other gate adjoining formed a prison for State, ecclesiastical, and parliamentary offenders, prisoners from the Court of Conscience, as well as for debtors and felons, but the latter are said to have been brought through Thieving Lane and Union Street, so as to avoid the precincts of the liberties of Sanctuary.

It will therefore be observed that the ancient custom of placing watchmen's, or police stations

at or near to the gates of towns and cities was a convenient arrangement inasmuch as criminals or suspected persons would frequently be recognised when attempting to "enter" a town, and for this reason it was an obviously convenient arrangement that provided a residence for the watchmen, combined with cell

of a married constable, with one or two cells, to the extensive buildings required for the accommodation of a large number of married and single constables, with parade yard, stabling for mounted police, and superintendents', inspectors', and sergeants' quarters.

A station-house upon a small scale may be

FIG. 7. MICKLEGATE BAR, YORK.

accommodation for prisoners, near to the bars or gates of cities.

In these days, police stations are to be found not only in towns, but in remote country districts, and with greatly varying accommodation, from the small station-house in charge

arranged as shown on Fig. 8, where is given a plan in which the office and cells, &c., are fully separated from the constable's cottage. This plan provides, on the ground floor, an office, with a special entrance from the street; a couple of cells, entered from a passage at the

rear, to prevent noise from the cells reaching the office, and with a yard and w.c. at the back. The constable's cottage has one good living room, with scullery, pantry, and w.c., and large yard (a small garden might well be added in country districts). On the first floor are three bedrooms, and a cupboard or store closet. It should be observed that on this plan the wall adjoining the station is arranged without any windows, thus preventing to some extent sounds reaching the bedrooms from noisy or drunken prisoners in the cells below.

The passage to the cells would be lighted by skylights in the roof, and the constable in charge would be able to inspect his prisoners, without disturbing them, through the inspection openings in the cell doors. Of these, details are given in Fig. 9, with other constructive details officially suggested, while Fig. 10 gives other details for the ventilation of the cells (see also Figs. 1 and 3).

It is one of the official requirements that, in arranging accommodation for the police, the prisoners' cells and the administrative part of the police station should be separate from the part in which the police reside, and the accommodation for the married constables and their families should be distinct and separate from that provided for the single constables.

FIG. 8. GROUND PLAN.

The accommodation for a superintendent should provide him, usually, with two sitting-rooms, kitchen, scullery, larder store, four bedrooms, dressing-room, a floor space of about 1660ft., water closet, and coal store, &c.

For an inspector or sergeant it is officially required that there be provided one sitting-room, kitchen, scullery, larder, three bedrooms, a floor space of about 1100ft., water closet and coal store, &c.

The accommodation for a married constable need not, usually, give more than a living-room or kitchen, scullery, larder, three bedrooms, a floor space of about 900ft., w.c. and coal store, &c.

In the single men's quarters there should be provided, according to numbers, mess and day-rooms, kitchen, scullery, cellars, bedrooms, bath and lavatory, clothes-room, brushing and cleaning-room, drying-rooms or closets, boot-rooms, w.c.'s and urinal.

SECTION.

DETAIL SHOWING CHASE FOR SERVICE PIPE TO ONE W.C.

PLAN.

SECTION.

FIG. 10. DETAILS OF GRATING AT MOUTH OF EXTRACTION FLUE.

In the official list of requirements, no mention is made of baths or bath-rooms for the superintendents and other higher members of the force, but the addition of these appears to be as necessary for officers as for men.

In the single men's quarters the bedrooms should be on the upper floors, and divided into bunks by partitions, which need not exceed 7ft. in height, 600 cubic feet per man at least should be allowed; the under and private clothing of the constable should be in a small cupboard in, or near to, the bunk.

The following further official requirements must also be provided for:—The bath and lavatory should be on the same floor as the bedroom and close to it, but with independent ventilation; the baths should have a supply of hot and cold water, and be provided in the proportion of four per cent.; the lavatory basins in the proportion of fifteen per cent. The clothes-room, brushing-room, and drying-room should all be situated not far from the entrance, but cut off from it, and arranged close together; the clothes-room should have ample space for hanging uniforms in use, and be provided with means for warming; the brushing and cleaning-room may occasionally be arranged as a passage near the drying and clothes-rooms, it should be well lighted, and be furnished with tables or benches for the cleaning of clothes, belts, &c., and have a lavatory basin; the drying-room should be very efficient, and should always be in operation on wet days, so that it can be used without delay or inconvenience by a constable coming in from duty, instead of small drying-rooms. Drying horses might be fixed in the usual way in closets, and thus a higher temperature could be maintained than would be possible in an open room. Boot-rooms, with racks for four pairs of boots per man, should be fixed at a little distance from the living-rooms. There should also be a space for cleaning dirty boots, with means of warming in order to dry the boots. The mess-room should be sufficiently large to allow of at least two-thirds of the men dining together comfortably and conveniently. It should be bright and well ventilated. For small messes, say up

to six men, there need be no second day-room, but for from six to twenty men there should be a second day-room. If more than twenty men, there should be a mess-room, a recreation-room, and a library for reading and writing, the last being never more than 20ft. by 15ft., and in a quiet position. The chief points to be attended to in the designing of these rooms is that they should be bright, above ground, and provide perfect comfort and relaxation to the men using them. The kitchen should be near the mess-room, yet distinctly cut off from it. All the cooking for large messes should be done in it, and not in the mess-room. Cellarage and other storage may be found in the basement, if it be necessary to construct one; every apartment should have inlet and extract ventilators. The water or earth closets should be in the yard, and provided at the rate of 5 per cent. of the inmates. Every closet should be well lighted, the urinals should be of slate, and five compartments per cent. allowed for the use of residents. If the number of men for night duty exceeds five or six, a parade shed, sufficiently large for the convenient parading for inspection, should be provided in the yard. In important stations the shed should be completely inclosed, and it should have ample means of lighting, the width being not less than 15ft.

The provision of cottages or flats for the married constables should certainly afford all the privacy that can be reasonably attained. By keeping men in such buildings as barracks or hospitals, &c., we can doubtless feed and warm them more scientifically, but to attempt such provision for the police and others would be unnecessarily destructive of home life and surroundings, and perhaps of those hours of repose and leisure, which by many can only be secured by retirement from the society of other officials.

The most perfect arrangement of the country policeman's cottage and station is when they stand apart from other buildings. In this way the utmost privacy that the condition of the constable admits of would be afforded, but, unfortunately, considerations of economy interfere too greatly with such arrangements.

SECTION.

DETAIL SHOWING CHASE FOR SERVICE PIPES TO TWO W.C.'S

PART ELEVATION

FIG. 9.

The garden, if any, should be as much as possible in front of the police station cottage, and be placed with due regard to sunshine. A garden in front is frequently better tended and kept neater than one not to be seen from the public road. The garden may be fenced by a hawthorn hedge, or better by a low wall, along which the hardier fruit-bearing shrubs—the currant, gooseberry, or raspberry—may be trained, and the same plants may intersect the garden, dividing it into compartments; also useful trees may find a place, as the apple, pear, plum, &c., while flowering shrubs, as the woodbine, the lilac, and rose, may be trained to the cottage station wall. Let not such things be churlishly neglected or withheld, even from police cottages—they are calculated to humanise the dispositions of all, and to compensate liberally for the labour we may bestow in our care of them, and afford a healthful occupation for vacant hours. Therefore, while the city policeman may (by official provisions) have recreation-rooms and a library, the isolated village constable may well be granted a little garden land in connection with his country police station.

(To be continued.)

A LOCAL Government Board inquiry has been held at Armagh with regard to the application for sanction to the loan of £12,000 for sewerage works.

A LOCAL Government Board inquiry has been held at Sheffield into an application by the Corporation for sanction to borrow £14,633 for works of sewerage, £6600 for the conversion of privies into water closets, and £3894 for purposes of street improvements.

THE Sanitary Institute has just opened a course of lectures at the Parkes Museum on the following subjects: Sanitary Law, Supervision of Food Supply, Trade Nuisances, Infectious Diseases, Water Supply, Ventilation, Building Construction, House Drainage, Sanitary Appliances, Scavenging, and Disposal of House Refuse and Sewerage.

HASTINGS proposes to add to its borough debt about £148,000 for carrying out the various public works the corporation have decided upon. Upwards of £139,000 is required for a water supply scheme, it having been resolved to tap the Brede Valley. The remainder of the money will be expended in works of sea defence, the erection of more covered seats on the front, street improvements, and other matters.

DOCK CONSTRUCTION AT BARRY.

THE No. 2 Dock at Barry is near completion. The last of the foundations for completing the sill walls has been laid, and there remains only the work of excavating a little mound at the dock bottom before water will be

FIG. 9A. ELEVATION OF INSPECTION PLATE ON DOOR.

let in through the sluices in the new caisson that at present stops inflow from the old dock. The contractors are Messrs. Price and Wills, whose local agent is Mr. R. Hollowday. The

FIG. 9B.

total length of the dock is 3300ft., and on the north side has ten high-level tips of an improved kind, a valuable improvement being the fact that no "wells" are necessary for the

hydraulic machinery. These have in the old dock occasioned fatal result in the case of accident to workmen. The tips have been supplied by Messrs. Tannett, Walker, and Co., and the approaches constructed by Messrs. Keys and Co., of Birmingham, are of iron, those at the other dock being of wood. The large caisson between the two docks is being built by Messrs. Robert Stevenson and Co., of the Tyne, the firm who built the deep water lock gates. The large number of hydraulic capstans and cranes that are required are being laid by Sir William Armstrong and Co. Five of the tips are at the present time nearly completed, and are connected by railways running obliquely from the main line to the north; and between the last two tips perpendicular walls have been built to afford a space for the future construction of a moveable tip similar to that in use at the present time at the other dock. The work of excavation has proceeded very rapidly from the commencement, the contractors being favoured with suitable weather almost throughout, the mud banks being removed when the ground was frozen, and literally carved out; and as an indication of the amount of work done it will be sufficient to state that three and three-quarter million cubic yards of debris has been removed, the chief portion being placed slightly to the south, and now forms the quayage space, 700ft. wide, upon which capacious warehouses will be erected, in addition to a crane road, sidings, and highway. The timber pond is to be located on the moors directly to the east of the dock, and from here about 30,000 cubic yards of debris will have to be excavated, and this work is now commenced. At the dock bottom the anchorage for eleven buoys have been laid, and these are supplied by Messrs. Brown and Lenox, of Pontypridd. In the extreme south-east corner is erected a large hydraulic engine-house, in which are being set up two powerful engines with four boilers, room being provided for double this power if necessary. The stack for this house will form a landmark to mariners in substitution for Warren Tump, being near the place where this large mound stood, and, being 120ft. high, it may be easily seen from the Channel. At each of the four corners of the dock a hydraulic accumulator is placed, one of these being already in use. The only work of any magnitude that remains to be done is that of completing the waterway between the Nos. 1 and 2 docks.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
Feb. 26	Canterbury—Erection of Refuse Destructor, &c., Buildings	Corporation	City Surveyor, 23, St. Margaret's-street, Canterbury.

THE MEDIEVAL CAMPANILI OF ROME.

MR. J. TAVENOR PERRY read a paper on the above subject at a meeting of the R.I.B.A. on Monday. In his opening remarks he alluded to the well-known character of the towers, and to the fact that so little was known of their history, and that so little had been written about them. He showed the urgent necessity of some detailed record of them, since already many had disappeared, and all were falling into a state of serious dilapidation. He pointed out that while there was a difference in the campanili, at the same time they were

SO SINGULARLY ALIKE

that one could not doubt they belonged to the same period and the same school. The building of towers at Rome was a tradition of classical times and no invention of the mediæval period, either for defensive purposes or ecclesiastical use. When the towers became necessary for purposes other than for defence or ornamentation, then models were found. The towers were built for two-fold purposes. First, to provide a place of safety for the treasures of the church, during the frequent tumults in the city, or for protection against the attacks of the pirates; and secondly, for the hanging of the church bells, which, from the time of Constantine, were used to summon the faithful to worship. In some cases, the superstructure belonged to the same period in which the towers were built, or to a subsequent period.

THERE WAS LITTLE AUTHORITY

upon which to fix the date of any of the campanili, beyond the mentioning that some particular church was built for a particular purpose without any reference to the towers. There was one case, however, in which, though there was no written account, the paintings might, perhaps, be relied upon more than the architecture. But it was only when they examined the buildings, apart from the statements of historians, that they were enabled to form an opinion as to their erection. The lecturer proceeded to enumerate the campanili still standing, specially mentioning those built by Pliny, Augustus, and Diocletian and representations of those which have been found, particularly that on a ceiling discovered in the Farnesina gardens by Professor Lanciani. The first recorded erection of a bell-tower in Rome is that of St. Peter's in the middle of the eighth century, which was restored, by Leo the Third, a few years later. In giving an abstract of the principal events in mediæval Roman history, as related by Gregorovius, an attempt was made to show that only during very limited periods were building operations possible in Rome, and that the most important of these was the time of Leo the Fourth after the repulse of the Saracens.

THE DETAILS OF THE CONSTRUCTION

and decoration of the towers were described in relation to their likeness to or divergence from classic examples, particularly in reference to their arcades; and an attempt was made by a comparison between these and the windows of some English towers known as "Saxon" to establish the theory of their early date. He said "Whence did the Saxons derive their ideas on this subject? Not from the scanty vestiges of antiquity still remaining in the island, not from France or Germany, where such features were unknown; but from the only place where they could by any possibility exist—Rome itself. Alfred the Great, entering St. Peter's for the coronation of his father, Ethelwulf, had before him the great campanile of Stephen and Leo, and, when leaving, from the steps of the atrium, he may have seen the campanile of St. Michele of the Saxons in the Borgo, much as we see it now." A comparison was further made between the dated

EXAMPLES OF TOWERS IN NORTH AND SOUTH ITALY,

such as those of Milan, Amalfi, &c., with a view to show that the Roman examples were of an earlier date. The niches on some of the

towers were described, and it was suggested that these were not intended for statues but to shelter sacred paintings, of which great numbers reached Rome from Byzantium in the time of Leo the Iconoclast. The majolica decorations were mentioned as indications of date, those on SS. Giovanni e Paolo being assumed to be co-eval with the tower, and painted for the position they occupy. In conclusion an account was given of

THE STATE OF DILAPIDATION

into which most of the campanili had fallen, and the damage which had been done to them by injudicious restoration or repair. —The paper was illustrated by a great many pen and ink drawings, by the author, of the towers and their details. —Mr. Phené Spiers, who proposed a vote of thanks to the lecturer, said in the papers which he had had the privilege of reading at the Institute he was afraid the general tendency was to prove that the buildings he described were of a later date than that which hitherto had been given to them. It was, therefore, some relief to have Mr. Perry coming forward to prove that the authorities were wrong, and that a much earlier date could be given to certain features of the campanili. Mr. Perry based his arguments on three reasonings: First, the historical one, in which he had the great advantage of quoting the publication of Gregorovius. This was almost the first time they had a book of careful enquiry into this question, for, as Mr. Perry had pointed out,

THE SUBJECT HAD BEEN GREATLY NEGLECTED

by everyone; but the few extracts given by Mr. Perry showed ample records of proof, contrary to the generally accepted opinion, that these towers belonged only to the twelfth and thirteenth centuries. Secondly, it seemed to him perfectly clear that bell towers did exist at the period mentioned. Mr. Perry had not been able to find out, and neither had the speaker, whether these towers had capitols or not, but, at any rate, there was the lofty tower of the sixth century. Of course, there was the very important question which was suggested by the reference to the Saracens, Normans, and other people, namely—whether, if they burnt so many churches, they would have allowed these towers to exist still. That was a point which suggested to many authors, Fergusson and others, the idea that they must have been all destroyed, and therefore that

THE PRESENT TOWERS

were of a later period. Thirdly, Mr. Perry only spoke of "certain features" in the towers, which he, however, considered the most interesting points. He knew that one design given was certainly of Byzantine origin, though he could not say of what date. Then there was the question of the wall shafting, and there he found it rather difficult to follow the lecturer, because he had described as "a feature" what he (the speaker) looked upon as a dossered; or what he regarded as a block or ugly capitol, the lecturer called a capitol frankly. It depended upon what one understood by a capitol. He understood one of the arguments of Mr. Perry was to prove that a feature was introduced and no capitol underneath. The absence of a well-known feature in these earlier examples was a singular coincidence, but they knew it had been copied in this country

IN THE SAXON PERIOD.

Mr. Perry alluded to three or four Saxon churches. He (the speaker) visited the church at Worth the other day. During the restoration there a few years ago they discovered some original Saxon windows, and they were identically the same as those in the campanili in Rome. The copy was very rude and commonplace, but it must have had some origin, and it seemed to him that the only origin it could have had was that derived from Rome. —Mr. H. H. Statham seconded the vote of thanks, observing that it was a useful paper that gave some new information. —Mr. Woodward said he could not help hoping that some one in the position of Mr. Perry would devote an equal amount of time and study to illustrating the Norman round towers which

they saw scattered about England, the uses of which had not, so far as he knew, yet been clearly defined. They might have had an origin of a similar character to the origin of the campanili. They were watch towers, they knew, but possibly campanili also. If a similar collection of sketches of the round towers could be made, and a study of them also, he felt sure they would be useful to the Institute. —The Chairman (Mr. H. L. Florence) said there was one point about the paper which was worthy of notice. The Institute awarded a travelling studentship every year, the Soane medallion. It might be said that they had read and learnt of all to be seen in foreign travels, but from the lecturer's paper they saw there was really a

GREAT DEAL TO BE LEARNED

from actual study of the buildings. Mr. Perry had shown them that even upon subjects like the campanili of Rome, with which they were all acquainted, yet many of them who had been to Rome, and looked at them superficially, had a great deal to learn. —Mr. Perry briefly replied.

SIDE WINDOWS OF SUSSEX CHURCHES.

MR. P. M. JOHNSTON contributed a paper on "The Low Side Windows of Sussex Churches," at a recent meeting of the Sussex Archaeological Society, at Eastbourne. He remarked that no satisfactory explanation had yet been offered as to the origin of these curious openings, which he had found present in thirty-three of the Sussex churches, while probably a more particular survey, which he had advised should be made, would reveal a larger number. There were only two instances, so far as he knew, in Sussex, of these windows being found outside the chancel—in Buxted Church, and in St. Clement's, Hastings. Running through the list of churches possessing these windows, Mr. Johnston complained of the manner in which such interesting village churches as those at Rustington and elsewhere were neglected, where, as also at Ford, the sill of the low side window was marked by the primitive sundial, as indicative of some exterior connection. As to the uses of these windows, there was an old theory that lepers and others with infectious diseases received the Eucharist through them, but inasmuch as the position of some of the windows would not permit of this, or even of the view of the high altar, the theory was now regarded as untenable. Similarly the idea that they were to give a view from outside of the Pascal or some other light was no longer seriously held by archaeologists to-day, while the grille, or ironwork, of some of them disposed of the idea that these openings were for the ringing of the Sanctus bell. Another theory that these openings were for the ventilation of the building was scarcely one that would have been likely to have commended itself to their ancestors. So that eventually they came to the confessional theory—that these openings were for the hearing of confessions—a theory which was supported by a communication on record by one of the Commissioners appointed to inquire as to the religious houses by Henry VIII., who recommended that those places, where the Friars were wont to hear the confessions of the people, should be walled up.

The Glossop Town Council has adopted the plans of a technical school to be built on a site opposite the Free Library. The architects are Messrs. Douglas and Minshall, of Chester.

MR. GEORGE PIRIE, Aberdeen, is the successful contractor for the Caledonian Railway, to construct the Blackwood to Lesmahagow line. The contract price is between £70,000 and £80,000.

A STAINED glass window has been erected in Free St. Paul's Church, Dundee. The subjects represented are Faith, Hope, and Charity, and the work was entrusted to Messrs. Clayton and Bell, London.

THE HOUSING OF THE DRAMA.*

BY EDWIN O. SACHS,

Author of "Modern Opera Houses and Theatres," &c.

(Continued from page 24.)

I HAVE referred to the People's Theatre, which is entirely the result of small subscriptions or donations. There is the People's Theatre at Worms, which was erected when that town had 30,000 inhabitants. Is not that building in every way suited for the presentation of plays? Or take the Subscription theatres, which are primarily due to the efforts of donors with the intent of furthering some special cause, like the various national movements. There is the German Theatre at Prague and the German Theatre at Vienna. Everywhere we have the same story—that freedom from monetary anxieties, reverence for the Drama, and the demand on the part of the general public for the suitable housing of that Art, as well as for good Architecture, result in playhouses which fulfil both ideal and practical requirements in every way. I cannot attempt any description of the examples that I have here mentioned. As I have said before, it is not my ambition to go into details as regards the individual merits of buildings, their construction or equipment, and, with only one or two exceptions, I wish to draw attention to the circumstances under which the Drama is housed. I will, however, again point out that, of course, where theatres have to fulfil the double purposes of a opera house and a dramatic house, the results, as far as the Drama is concerned, can never be so satisfactory as where the building is specially erected for a single purpose alone. This remark applies more particularly to such magnificent buildings as the New Theatre at Dresden, which is primarily an opera house, though grand Drama is also presented within its walls. It refers also to playhouses like that at Odessa. But in spite of the disadvantages of proportions and dimensions, the Municipal, Subscription, and Endowed theatres which fulfil double purposes of opera and Drama are certainly a more fitting home for dramatic art than the private theatre I first referred to.

EXAMPLES OF COURT AND GOVERNMENT THEATRES.

Having dealt with examples of the private theatre, the Municipal, the Subscription, and Endowed theatres, I cannot but refer to instances of the Court and National institutions, the more so as it is among the former theatres that we have the most magnificent home for the Drama extant. This example, the Vienna Court Theatre, better known as the "Hofburg," takes the leading place among all dramatic houses. It is the greatest monument that has ever been erected in this direction. It is a Court playhouse in the fullest sense of the term, and it is the property of an Emperor. It is the recognised centre of the Drama of the Teutonic tongue. It can be entered for the low price of sixpence. It is the great monument of the Austrian nation, and there is no modern building to which any community points with greater pride than this Court Theatre. Nor have they erred in their judgment, for as an example of technical skill brought to high perfection it is the foremost home for the Drama that has yet been created, both from the artist's, the architect's, the author's, and the actor's point of view. This building embodies everything that is suitable to a home for the grand Drama (and I use the term "grand Drama" advisedly, for the auditorium is too large for the chamber play). Owing to the remarkable position occupied by this playhouse, I may be excused for calling attention to some of the principal features of the design, and reminding you that the structure is the outcome of the combined efforts of Gottfried Semper and Baron Hasenauer. The plan and the general lines of the design embody the results of Semper's long study on

the question of so-called radial planning, whilst the decoration and equipment give expression to that wonderful delight in characteristic detail and ornament in which Baron Hasenauer excelled. Semper's experience on the Dresden theatres formed the stepping stones for the general conception, and Baron Hasenauer's experience in the decoration of the Vienna Court Museums stood him in good stead. Apart from the ideal surroundings of this structure, which is situated on one of the most beautiful boulevards of the Austrian capital, it is the segmental treatment of the façade and its two wings which at once strike the eye, and give this playhouse its individuality. The wings, it is true, are due to the special requirements of the site and the desire to add to the importance of the block, but the segmental treatment is solely the outcome of the

SYSTEM OF RADIAL PLANNING

referred to. Then it will be noticed that the general grouping is remarkable for the rational manner in which the exterior expresses every part of the interior arrangements. This characteristic is likewise very evident in the rendering of the principal façade. In the interior the segmental foyer is certainly the chief feature, and it is to be observed that the same formation is given to the grand vestibule, and also to the minor lounge which is attached to the third and fourth tiers. As regards the conception of the grand foyer, with its simple grouping of tiers of pilasters, its exquisite colour study and decoration, it is impossible for me to say more than that, with the aid of brilliant workmanship, perfection has been nearly achieved. The next feature is the manner in which the two grand staircases rise from the street level to the first tier in one broad flight. In the auditorium again, I would call attention to the prominence given to the royal boxes in the proscenium and the central State box. The careful and varied decoration of the box division is remarkable, and in the ceiling there is a skilful blending of semi-relief work with painted surface which has a note of originality. The building is remarkable for the extensive use of iron and steel in the containing walls of the auditorium, which are practically composed entirely of metal plates fitted together in such a manner that the intermediate spaces are used as ducts for ventilation and warming. One of the characteristics of the "Hofburg" theatre is the thorough way in which these and other technical appliances, both for the stage and auditorium, have been elaborated. Everything that modern ingenuity has been able to discover is utilised in the block with more or less success, and in no part has the engineer's work been hindered as is frequently observed in other theatres where architects have disregarded the requirements of the allied professions. Let me repeat that the Vienna Court Theatre, erected at a cost of nearly £550,000 and planned to hold an audience of 1475 persons, is indeed

A MOST ELABORATE AND WONDERFUL STRUCTURE.

Taken as a whole, the architectural rendering is of the highest order of Art, and more nearly approaches perfection than in any other such building erected during the present century. This theatre offers a striking instance of that high standard of theatre construction which I consider essential for the suitable housing of the Drama. Now this is the only example of a true home for the Drama of which I have attempted to indicate some of the main features of the design, for the simple reason that it embodies the highest standard of a dramatic home which the world possesses. As I have said, it is a Court theatre owned by a monarch. I have spoken of the Municipal theatre, the Subscription theatre, and the Endowed theatre. It is apparent that we cannot expect from the private theatre what the other classes of structure give us; on the other hand, our institutions are such as make it highly improbable that we shall within reasonable time have either a Court theatre or a State theatre, and with the few

exceptions in our most go-ahead cities in the north, it appears most unlikely that we shall soon see the Municipal theatre. May I then ask if it is not time to consider the question of Subscription and Endowed theatres seriously? If we subscribe to the erection of picture galleries and the homes of other arts, why can we not subscribe for the theatre? If we endow museums and libraries, which are to aid in our education and afford us beneficial recreation, why can we not similarly endow the theatre? If we wish to erect monuments to mark the culture and prosperity of our times, why should they not take the form of playhouses; and if it is the universal desire that facilities for education should be given, why limit our gifts to the collection and distribution of books, or the collection and presentation of art treasures when words on the stage, properly spoken in suitable surroundings, produce a far greater impression on the mind than any amount of book reading or the study of collections? As I have said, the spirit which pervades our Government at the present time, and which will pervade it for some time to come, prohibits our expecting a State theatre, and I do not think there is any likelihood of our Court contemplating the erection of a playhouse. To repeat, there is but a very slight chance of having a Municipal playhouse. Hence, why not, as with so many other institutions by which England has become great, let the citizens take the initiative themselves, and either by subscription or through endowment by the wealthier members of the community, give us that high standard of playhouse which we should rightly long have had. Surely the architect who writhes as he sees the many theatres from which every vestige of the feeling of Art is absent, should help to his very utmost in any movement towards providing us with better homes for the Drama, structures which should at the same time become some of the most decorative features of our cities. Failing Government or Municipal action, surely the Subscription or the Endowed theatre will lead soonest to this end. Hence, may I conclude by urging that the architect, with his great influence among all manner of men, should advocate the Subscription and Endowed theatre, the only practical road at the present time towards the Drama being suitably housed with due dignity and full regard to the possibilities of architectural design.

A new lych-gate has been erected at Llande-faelog-fach, in Breconshire. The work has been carried out by Mr. Griffiths, of Brecon, from designs by Mr. F. R. Kempson, F.R.I.B.A., of Cardiff.

With reference to the much discussed Westminster Improvement Scheme, Mr. Norman Shaw has accepted the position of architect to the Board, and Mr. Lutyens will be associated with him.

At a cost of over £20,000 the Corporation of the City has succeeded in effecting an admirable rearrangement in Smithfield. The old fish market, which for years past has been ignominiously hidden away in a nook, is now installed in the newer building near Farringdon Street Station.

FUNDS are being raised in the diocese of Ripon with the view of establishing a mission-house as a memorial to the late Dean Fremantle. The improvement of the east window of Ripon Cathedral, and the fixing of brass memorial tablets on each side of the window, form part of the scheme.

A new technical school has been provided for the parts of Kesteven and the Borough of Grantham. The school, which is situate at the rear of the Grantham Guildhall, has had a somewhat remarkable history, inasmuch as it was originally a prison, then a cigar factory, and eventually a technical school.

The London County Council has passed an estimate of £3300 for the electric lighting of the Embankment. The capital expenditure for the installation is estimated at about £25,300, and the probable annual cost of maintenance £3509. There will be lamps on each side of the carriage way, about 240ft. from each other, and on Westminster Bridge and Northumberland Avenue.

* A paper read before the Royal Institute of British Architects on February 7th.

Professional Items.

ABERDEEN.—The Aberdeen Town Council recently discussed at some length a proposal which practically amounted to dispensing with the services of the present city architect. In the meantime the duties are discharged satisfactorily by Mr. John Rust, who, at the same time, carries on a private practice. The Finance Committee, by eight to two, recommended that no alteration be made upon the present arrangement; but it was proposed that the Council appoint a Master of Works, whose duty would be to look after the town's property, and prepare, sketch, or block plans when required to do so by any committee of the Town Council. It was urged that Mr. Rust had an advantage over other architects competing against him for town's work. The amendment was, however, rejected by twenty-three to six votes, so that the present arrangement will continue.

ALCESTER.—The Alcester Guardians have considered the report of the committee re the enlargement of the workhouse infirmary. It was stated that the best and least expensive course to improve the greatly-overcrowded state and defective arrangements in the infirmary wards was to erect a new infirmary altogether, for which Mr. W. H. Ward, architect, Birmingham, had prepared sketch plans. Mr. Ward's estimated costs of the new buildings was £5820, exclusive of land, and it was decided to apply to the Local Government Board for a loan of £7000.

CLECKHEATON.—The new Liberal Club, just opened, is a building of two stories in the Renaissance style, and, exclusive of site and furniture, has cost £2500. There is a fine Ashlar stone frontage to the main elevation, which stands back a little from Northgate, and which has mullioned and transomed windows. Above the entrance is a balcony, to which access is obtained from one of the upper rooms. The hall is paved in mosaic; to the right is a reading room, 28ft. by 17½ft., with a floor of wood blocks; opposite is the committee-room, 17½ft. by 15½ft. The assembly or recreation-room, on the same floor, is 36ft. by 28ft., and will accommodate about 180 persons. There are separate entrances to the room, and thus special gatherings may be held here without causing any inconvenience to the members in other portions of the premises. A broad staircase leads from behind the committee-room to the second floor, on which there are two billiard-rooms, a bar, card-room, and lavatories. The rooms are heated by a moist-air apparatus. The whole building is of stone, and has been erected from the designs of Mr. Reuben Castle, architect, Cleckheaton.

GUNNERSBURY, W.—The new chancel of St. James's, Gunnersbury, W., which the Bishop of London consecrated last week, is the same width as the nave, and measures 40ft. in length from the chancel arch to the eastern wall, and the height from floor of choir to the apex of ceiling is 42ft. On the north side are the vestries and organ chamber, with open arches towards the chancel and nave aisle. On the south side of chancel, facing the high road, it is proposed to add at a future time a south aisle, which may be used as a morning chapel, but at present the arches are filled in with a temporary wall. The building has been carried out in the Early Pointed style, in harmony with the rest of the church, but the work in the arches, traceried windows, and redence is somewhat richer in character. The oak work of the screens and reredos is in a later style of church work. The screen dividing the chancel from the nave is of light, pen oak work; the lower part, like the reredos, as carved ribbon panels, and here also there will be opportunity of future painted decorations. The nave of the church, owing to the removal of temporary chancel, has had extended new accommodation added, and the pulpit has been altered and re-arranged to suit its

new position against the south pier of the chancel arch. The building work has been executed by Messrs. Dorey and Company, of Brentford; the oak screens and reredos are by Mr. Caldecleugh, of Durham; the tile floors by Messrs. Carter, Johnson and Company. The whole of the works have been carried out from the designs and under the personal supervision of the architect, Mr. Howard Chatfield Clarke, of 63, Bishopsgate Street Within, E.C., the cost having been about £2750.

HUDDERSFIELD.—The St. Joseph's Catholic Church has just undergone renovation and decoration. The representation of the Sacred Heart in the sanctuary is the most noticeable decoration. It has been effected in the Florentine style by Messrs. Cracco, a Belgian firm. In other parts of the edifice there are fourteen pictures of the Stations of the Cross, painted by Messrs. Lunn and Carduo, of Huddersfield.

PRESTON.—The scheme of decoration entered upon some time ago at St. George's Church has been completed. St. George's was originally a chapel-of-ease to the parish church, and was built in 1723. The chancel was rebuilt in 1843-4, and considerable alterations took place in 1848, when the edifice was faced with stone. The general scheme of decoration was commenced a few years ago, when a large fresco of the "Adoration of the Kings and Shepherds" was painted over the chancel arch, and on the side walls figures illustrating the "Te Deum," angels, prophets, apostles, martyrs, and churchmen. The nave walls were also decorated with ornament, leaving the ten large oblong panels over the arches (five on each side) to be subsequently filled with fresco figure subjects, which has now been done. At this time also the ten wheel windows of the nave were filled with stained glass, representing seated figures of the prophets, bearing scrolls inscribed with texts of prophecy. With regard to the scheme of decoration now completed, commencing in the sacristy, which has an apsidal termination, the apex of the semi-dome is filled with an Adoration of the Lamb, the Lamb occupying the centre panel, with adoring angels at the sides. In the large dome panels below are standing figures of Cherubim and Seraphim painted on a rich gold background of mosaic-like effect. Over the semi-circular window heads are seated figures of the four Evangelists, with SS. Peter and Paul. The outer (westernmost) panels of the sacristy roof are treated with foliage and fruit in rich colours, and raised gesso work of gold, and the wall spaces below contain figures of SS. James and Jude (to complete the writers of the New Testament), and Abraham and Samuel. In the nave the five large bays over the arches on the north side are occupied by a long processional fresco, representing the journey of the Israelites to the Promised Land. In the corresponding bays on the south side of the nave is a processional fresco of our Lord's entry into Jerusalem. The wheel window at the west end of the church is filled with a figure of our Lord seated in majesty, and on the wall spaces on either side are painted figures of angels offering incense. Below this window and above the arch of the baptistery is a large wall space, on which a fresco has been painted representing the baptism of our Lord, with surrounding figures among foliage of the Prophet Isaiah and seven angels, typifying the seven gifts of the Holy Spirit. Below the subject runs a scroll, on which is written a text, and above the subject are three scrolls with texts. The treatment of the baptistery is charming in effect. Above the dado and below the wall-plate are six small figures of angels standing among iris flowers, bearing scrolls. The roof is of blue, and is ornamented with descending tongues of flame interspersed with twelve descending doves, emblematic of the twelve fruits of the Holy Spirit. The baptistery window represents the subject of "Christ blessing little children." The whole of the work, both stained glass and decoration, has been designed and carried out by Messrs. Shrigley and Hunt, of Lancaster and London.

PLYMOUTH.—Building operations are unusually brisk in Eastern Plymouth. Within recent years a new town has been planted out in that direction. It continues to extend. At the present time the chief seat of activity is just to the east of Salisbury Road. Surveying operations have been commenced upon a new and extensive plot of ground to the north of the railway line. It is there that the Plymouth Baptists intend erecting their new church.

SWANSEA.—The new swing-bridge to connect Swansea with St. Thomas, and passing over the New Cut and the River Tawe, has been opened. The new bridge is a huge structure, the swing of which weighs over 480 tons, which has been put up at a cost of £27,000, and replaces a drawbridge. Cylinders have been sunk 25ft. into the bed of the river, and the bridge is carried on a turntable resting on girders on the sunk cylinders. It provides for two lines for foot passengers, two for vehicles, and one for trains. Its total length is 164ft. 6in., the swings being 72ft. and 92ft. 6in. from the centre of rotation. There is a fixed portion on the eastern side of 70ft. 9in., which makes the total length 234ft. 6in. Its width is 45ft. It is worked by hydraulic power, and is surmounted by a large glass house. It was designed by Mr. A. O. Schenk, and built by Messrs. Handysides, of Derby.

WAKEFIELD.—The new West Riding County Council offices have just been opened. The site contains more than 5000 square yards. The buildings cover three sides of a rectangular plot of land, the principal fronts being in Bond Street and Cliffe Parade. On both these fronts decorative carving is lavished with liberality and excellent taste. On the gables which break up the façade of the building in various places, the decoration is emblematic of literature, art, music, and science. In other places justice, education, progress, and health are depicted. On the main front toward Bond Street the principal decorative feature is a fine arcade or loggia, the piers supporting which are relieved by large statues. Among the subjects represented are a miner, an iron moulder, an engineer, a spinner, a glass blower, a potter, and a farm labourer. These figures, and most of the decorative work on the exterior, have been sculptured by Mr. Rhind, of Edinburgh. Internally suites of offices are provided for the different departments, and there are a library, a luncheon-room, several committee rooms, and, of course, a large hall for the meetings of the Council. The latter apartment, with a graceful domed ceiling, is capably arranged, and it is anticipated—so far as calculation can provide for such a matter—that it will be acoustically perfect. The windows in the hall and on several of the staircases and corridors are decorated with the arms of the principal families of the riding, many of whose representatives have been, or still are, members of the Council. The ante-room to the council hall, though not large, is one of the most striking rooms in the building by reason of its fine frieze of moulded and coloured plaster. This represents scenes in the Wars of the Roses, the first exhibiting the great battle of Wakefield; another the finding of the crown of Richard III. at Bosworth, and its assumption by Henry VII.; the third, the entry of Henry VII. with Elizabeth of York into Wakefield after their marriage; and the fourth, the delivery by Queen Margaret of Anjou of her son to the Hexham robber. The sculptor was Mr. Fehr, of London. The whole building has been designed by Messrs. Gibson and Russell, of London, and the contractors are Messrs. Armitage and Hodgson, of Leeds.

WESTON-SUPER-MARE.—The Urban District Council has considered the plans for the improvement of the market and for extending the Knightstone Baths. The plans of Messrs. Price and Wooller for the former were approved, and tenders for the work are to be invited. Two sets of competitive plans for an extension of the slipper baths at Knightstone were sent in under seal, and the Council approved those prepared by Mr. S. J. Wilde. It was agreed to ask Mr. Wilde to at once prepare detailed plan and specification.

Under Discussion.

THE WINTER SESSION.

"NORMANDY."

At a meeting of the Edinburgh Architectural Society, on the night of the 16th inst., Mr. Wm. M. Cumming, president in the chair—a paper was read by Mr. J. E. Forbes, entitled "Normandy." Mr. Forbes gave an interesting account of his tour, and sketched the general characteristics of the towns in Normandy, especially pointing out the peculiar beauty of colour pervading the landscape. Rouen was specially mentioned as being exceptionally artistic, showing marked examples of the fourteenth and fifteenth century Architecture. Passing on to Lisieux, Mr. Forbes mentioned the timber-framed houses as worthy of notice, comparing favourably with like work in Chester.

BATH MASTER BUILDERS' ASSOCIATION.

The annual dinner of this association was held under the presidency of Mr. George J. Long. The toast of the "National Association of Master Builders of Great Britain and the Federation of the West of England and South Wales" was given by Mr. G. Parrin, of Bristol. Mr. A. Krauss, of Bristol, responded, and said the Federation had done a great deal of good, and he hoped through the loyalty of the members it would prove of benefit with regard to the dispute with masons now occurring at Cardiff.—Mr. E. W. Wood gave "Architects and Surveyors."—Messrs. T. B. Silcock and H. W. Matthews responded.—Mr. F. N. Cowlin, of Bristol, proposed "The Bath Master Builders' Association," and the President replied. Mr. W. Dyer, of the Weston-super-Mare Association, responded to the toast of "Kindred Associations."

INSURANCE OFFICES AT EDINBURGH.

The Edinburgh Architectural Association has visited the new buildings of the Prudential Assurance Company (Limited) in St. Andrew Square, Edinburgh, under the leadership of Mr. Clark, the clerk of works. The members also paid a visit to the premises of Charles Jenner and Co., Princes Street, where they were conducted over the building by Mr. W. Hamilton Beattie, architect. An inspection was afterwards made of the Edinburgh Stock Exchange, where Mr. P. Maxton Cunningham acted as guide.

THE STREETS OF LEEDS.

A dinner in commemoration of the twenty-first anniversary of the founding of the Leeds and Yorkshire Architectural Society was held at the Queen's Hotel, Leeds. Mr. George Carson (President of the Society) was in the chair.—The Lord Mayor, in responding to the toast of the City Council, said if architects would spend a few hours from time to time in sketching a plan for making direct communication between various parts of the city, they would be doing a work almost of charity. There were means of communication in some directions, but the city sorely required cross streets. If architects could only devise a system of boulevards and broad streets in the centre of the city, he was sure it would be greatly valued by the City Council. Leeds must look to the architects to assist not only in arranging the streets, but, if possible, in raising the standard of beauty and proportion to something like that of Paris, which was so much admired. In walking through Regent Street, in London, no one could fail to notice the height of the buildings and the breadth of the streets. In Paris the regulations with regard to the height of the houses were very stringent. If the architects of Leeds could induce Mr. Batley and his colleagues on the Building Clauses Committee of the City Council to form a scheme which would secure that buildings of one kind were erected in one street, and buildings of another kind in another street,

Leeds, in the future, might be admired not only for its commercial enterprise, but also for its beauty.—Mr. W. M. Fawcett, in responding for the Royal Institute of British Architects and Allied Societies, remarked that the influence of the Institute had helped very much to bring about open competition for contracts. In the old days it was by canvassing that orders were secured when plans were submitted to public bodies. The influence of the Institute had been sufficient to do away with this to a very large extent. The Institute had brought about a system of examinations. That was a matter of the utmost difficulty. Some leading architects held themselves aloof from the proposal. They said that examinations did not make artists, and architects were artists. John Bright once said at Cambridge, "You Cambridge men do not make genius." He was immediately met with the reply, "No; we do not make genius, but we train it." It was the same with architects. The artist was a heaven-born genius. Examinations could not make an artist, but they might train him. He spoke with the greatest confidence of the good done by these examinations.—Mr. John Ely, President of the Manchester Society of Architects, also responded.—In proposing "The President and the Leeds and Yorkshire Architectural Society," Ald. Gordon said that there seemed to have been eras when architects in Leeds had good taste. But there had been eras with an absence of good taste. The present generation of architects had done much for the city. The president in many matters had done much to advance the beauty of the city. Architects were scoffed at for increasing their estimates, but he was sure that the fault lay with the employers who had weak purposes and no knowledge of the subject. Architects in Leeds had not the same chance as in some other cities. The atmosphere, for one thing, was against them. There was something more than beauty of form to be considered in Architecture; there was beauty of colour. In Leeds the beauty of colour could not stand against the attacks of the atmosphere, but some of the buildings of the city, notably the Town Hall, showed that a true and beautiful form would dwell long after the building had been blackened by soot.—The Chairman, who responded, said if the Corporation had begun many of the improvements which were now being carried out twenty or thirty years ago it would have been much to the advantage of the ratepayers. Referring to the congested districts in the east end of Leeds, the Chairman suggested that suburban villages might be made for the working classes. It would be an easy matter to arrange for workmen's trains.

ROAD CONSTRUCTION.

Mr. W. B. Beaumont, the newly-elected President of the Society of Engineers, delivered his inaugural address at the first meeting this year a few days ago. After alluding to the advances made in mechanical motive power, he said that some millions sterling were thrown away every year in the United Kingdom as a result of insufficient expenditure on roads and means of transport. Few realised how large a proportion of the whole of the industry of a country like England related to traffic and travel on land; still fewer realised how vast was the importance of good roads for the use of all. Only in some parts of some of our cities had we really satisfactory road pavements or road surfaces, and on comparatively few of our country roads were the surfaces at all approaching what they should be. At present there were about 1,400,000 draught horses at work in the United Kingdom. Of these, at least one-tenth could be easily dispensed with by small improvements upon the present methods of constructing and maintaining our road surfaces and by the improvement of the heavier gradients. On the road construction and maintenance of the future depended the development not only of the machinery required for the purpose but of high-class self-propelled vehicles for every application, and on the improvement of the road communications between towns and villages depended not only great engineering industries but the growth in the value of land.

Correspondence.

"THE DISSIPATIONS OF AN ARCHITECT."

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Under the title of "An Architectural Causerie," in a recent issue, some points are raised which, I think, are open to criticism, if not to censure. The writer says: "Sketching is a dangerous form of dissipation." What does he mean by sketching? If he means making elaborate drawings, showing detail which he alone can distinguish, I agree with him. It is most important, however, to sketch examples of good proportion and fully figure them in mass and in detail. Old buildings thus studied and noted is a practice which cannot fail to be of the greatest service from a practical point of view, for reference, not slavish imitation. Otherwise, how can we judge of proportion, we who design on paper where our predecessors designed with mallet and chisel, with far greater freedom and effect, than we with all our boasted nineteenth century enlightenment?

"Stifle any lurking ambition to become craftsmen," says the same writer. Would that more of us were imbued with the same ambition! The writer goes on to say that it is prejudicial to the attainment of full architectural growth. I emphatically disagree with this statement: the past furnishes us with rich examples of craftsmen who reached the summit of achievement in our own Profession. Michael Angelo and Grotto are sufficient witnesses, without mentioning lesser celebrities; but in truth we cannot get away from the fact that it was by reason of our predecessors being craftsmen that they were able to carry out their great conceptions. How shall we ever attain our ends unless we are able ourselves and with our own hands to direct our workmen. We have led them by our own foolishness into blindly and slavishly following us, whereas in reality they should be free as the air to embody our conceptions, crystallising them in the perfect ideal, as they certainly did of old.

If we are not careful the main fabric will pass from our hands as the control of the minor arts certainly has done.

The writer says further "that Architecture, no less than sculpture, is purely an appeal to the emotions through form, and the introduction of colour is no less distracting in one than in the other in their most intense forms." I think that colour always has been, and always will be, the most fitting medium for embodying beautiful form. We can no more dispense with the colouring of St. Mark's than with the sculptures from the Parthenon; both are their natural modes of expression. Unfortunately the art of colour has been gradually dying in our island, and the spasmodic attempts at its revival have not been altogether successful, which may account for H. V. L.'s evident prejudice against it as a mode of architectural expression.

Colour rightly used must always be a source of delight to man. We cherish it in our homes. Why should we banish it from the outside of our buildings? Our streets are sombre enough, with their stock brick, or, worse still, stuccoed fronts. Why should we not enliven them with a judicious use of coloured material, which, if suitably applied, should give excellent results?

I have just returned from a trip to Australia, where I found striking examples of how not to apply colour; but here, in our great city, we have every means at our disposal, and deserve to be branded as laggards if we do not avail ourselves of them.

Colour we can nearly all appreciate, bad as well as good, unfortunately; and it rests in our hands as architects as to whether our streets shall remain a triumph of the former or the latter.—Yours, etc., R. C. A.

A PROJECT for erecting a stained glass window in Lincoln Cathedral in honour of the late Lord Tennyson is being discussed in the county. The cost is estimated at between £250 and £300.

Enquiry Department.

Readers manifest a desire from time to time to assist those who avail themselves of the Enquiry Department instituted in this Journal, and many supplementary replies answering points raised in the Enquiry Department have been received from all quarters. The Editors, therefore, have decided, in order that Enquirers may benefit also by these kind offices, to publish the supplementary answers, in addition to the answers supplied by the technical experts associated with the staff of the Enquiry Department. The more widespread the information, the more effectually will the purposes of the Enquiry Department be served, and the Editors invite replies from any to whom the questions appeal, as they appear. Such answers must be to hand not later than Saturday morning for the forthcoming Wednesday's issue.

DRAINING BASEMENTS.

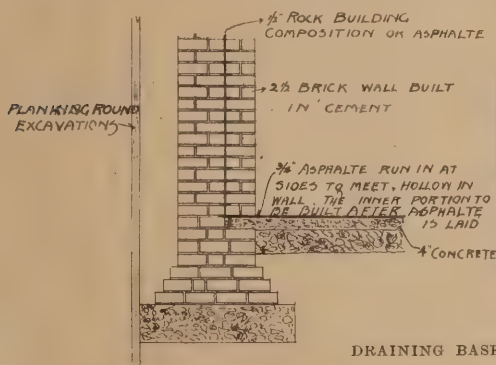

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—In regard to your reply to the query concerning the draining of basements, my experience is that a 12in. concrete floor, with the walls built in cement, will not form a perfectly dry basement. On the accompanying drawing I show a method of forming a pit in circumstances similar to those of your correspondent's case, which should insure a perfectly dry cellar.—Yours faithfully, J. McI.

THE VELOCITY OF STREAMS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I would feel obliged if you could

DRAINING BASEMENTS.

Views and Reviews.

A DICTIONARY OF ARCHITECTURAL TERMS.*

By R. S. BURN.

THIS is a bulky book of nearly 300 pages, printed in double columns of small type. The author has brought a vast amount of diligence and research to bear upon the work, which dissects and explains for those not already thoroughly conversant with the terminology of the architectural arts and building trades all the constituent parts of buildings, from a cathedral at one end of the gamut, to a coal cellar at the other. The architectural features of coal cellars, as may reasonably be supposed, have not given Mr. Burn much scope for his erudition. Far otherwise, however, is it with cathedrals. The most obvious criticism to be made by the youthful architect, fresh from Great Marlborough Street, and not yet numbered among the elect of the R.I.B.A., will be that he is not likely to come to very close quarters with cathedral work, and that Mr. Burn's industry has but enabled him to become conversant with it from an entirely armchair or academical point of view. This is by no means a reflection on the book now under review, because it is quite obvious that when one sets out to write a technical dictionary of this description, one must needs embrace everything from the Saxon style to syphons (which last, by the way, we are unable to find in these pages, spelt either with an "i" or a "y") only. To the great majority of architects, in their everyday practice, there is more "actuality" (to use the literary slang-word of the day) in syphons than cathedrals, for which not every member of the Profession can hope to receive a commission. From this practical point of view Mr. Burn may be recommended to add

the permanent way, instead of beside it, as before. Mr. Burn's description of "Cob Wall" is an instance of incomplete description, want of specialising, or want of exact illustration. He says: "A wall built with clay or adhesive soil, sometimes mixed with chopped straw, to secure a bond amongst the materials. Many cottages of the poorer class in the south of England are built in this way, and in South America more especially the system is largely employed." Now it is quite conceivable in these days, when the architect not unfrequently (and often with great advantage) goes back to the manner of building employed

IN OUR ANCESTORS' TIME,

that one might care to know more about these "cob walls." Well roofed, with projecting eaves to throw off the rain, a country cob-walled cottage has many recommendations. It is cheaper to construct, and is at once warmer and dryer than many brick and stone-built houses, while capable also of outlasting them. Mr. Burn might with advantage have pointed out that it is in the districts of England which do not produce stone that cob-walls are most frequently found. Thus, throughout Essex and in many parts of Devon and Dorset, cob flourishes, while in Essex the material has for centuries been so continuously used, alternately with "wattle and dab," that quite an interesting local form of art exists in the incised decoration of these "mud" walls. The practice in all districts where "cob" is used is to whitewash or limewhite it. Devon cob is made of red, clayey earth, mixed with pieces of red sandstone conglomerate rock and straw. The walls are commonly from 2ft. to 3ft. thick. The South American cob is known as "adobe," and is also common in Central America and Mexico. Mr. Burn's book, although (as would probably be inevitable in any book of the kind) not thoroughly posted up in local peculiarities of this kind, is generally reliable, and undoubtedly of great use. C. G. H.

THE Borough Surveyor of Swansea has submitted plans for additions to the Guildhall at a cost of £4000.

THE new branch of the North of Scotland Bank has been opened at Arbroath in the premises in High Street, acquired by the directors for the purpose.

THE City Corporation has decided to rearrange the street crossings at the approaches to Blackfriars Bridge, and construct permanent rests at a cost of £300.

THE Surrey County Council has sealed an agreement with the Middlesex County Council for the rebuilding of the bridge over the Thames at Kew, in accordance with designs prepared by Sir John Wolfe Barry, K.C.B.

THE London County Council has adopted a proposal for the expenditure of £197,000 on new fire-engine stations, steam fire-engines, and horse-escapes, which will involve an extra annual charge for maintenance of nearly £25,000.

THE Inverness Burgh School Board has instructed Mr. William Mackintosh, architect, Inverness, to prepare plans and specifications for the erection of a new school. The new building is intended to accommodate 500 pupils, and the estimated cost of its erection is £2000.

A FEW days ago an accident of an alarming character occurred in New Street, Aston. A number of double shop-fronts have been in course of reconstruction, and whilst two labourers were at work demolishing the buildings, a portion of one of the shops fell without the slightest warning, and both men were buried beneath the debris. Both, however, escaped without serious injury.

THE Improvement Committee of the Birmingham City Council have appointed Mr. James Tart to succeed Mr. P. Addie as manager of the Improvement Department of the Corporation, at a salary of £300 a year, his duties in the new capacity to commence on March 1, when Mr. Addie takes up the appointment of surveyor at Bristol. Mr. Tart has been an assistant to the managers of the department for some years.

inform me how to take the velocity of streams. Some books I have been reading show it in a roundabout way, but I think there must be a quicker method. Perhaps a good work showing clearly how streams, weirs, turbines, wheels, &c., are worked and gauged, the quantity of water necessary to give motion, &c., is obtainable.—I am, sincerely yours, J. F.

Feb. 16.

The velocity of a narrow stream can be ascertained by damming across it with a plank, having a notch, say 2in. deep by 6in. wide, cut in its upper edge, this notch leading by a funnel over a bucket or other receptacle of known capacity—or the notch can be in the form of a hole, closed on the outside by a sliding door. On the plank being placed in position, the slide is raised, and the time noted which is occupied in filling the bucket. The rest is a matter of simple calculation, the object, we presume, being to ascertain the amount of water which passes a given spot in a given time. Other facts can be deduced from this by the use of formulæ given in Stone's "Hydraulics," or in Vol. IV. of "Building Construction" (Longman and Co.). The same principle can be applied to gauging a broad river, though much judgment is required in fixing the position of the weir to obtain a mean velocity.

the missing word to his dictionary, which in many respects is valuable. Here and there, however, in testing his pages, one comes upon

A CERTAIN LOOSENESS OF DESCRIPTION,

or want of specialising, which is apt to be baulking to students. Gargoyles, for instance, are not to be correctly described as projecting "horizontally" from roofs or gutters. A more exact description would have put it that they project at an angle, slight, possibly, but still an angle. How else are you to get your water off those gutters? Take, also, the term "gantry." The author says "in carpentry," and goes on to describe the well-known timber-framing seen so frequently in London streets when buildings are being put up or demolished. He omits the engineering description of "gantry," which, now that an architect to be up-to-date must be also something of an engineer, should find a place in these pages. Perhaps the most outstanding iron and steel "gantry" to be instanced is the long one on which the Liverpool overhead railway runs. There are, in addition, "travelling gantries," and the newer type of junction signal-boxes on railways, in London at least, are mounted on steel gantries spanning

* A Technical Dictionary of Terms used in Architectural Design and Building Construction. By R. S. Burn, architect. London: Ward, Lock, and Co. B. T. Bateford.

Trade and Craft.

TRADE MARKS.

According to cable advice just to hand from America, the Diamond Steel Co., of Finsbury Pavement, London, E.C., and St. Louis, Mo., U.S.A., have won a trade mark suit in the United States Court of St. Louis which has been pending between them as defendants and the Pittsburg Crushed Steel Co., of Pittsburg, Pennsylvania, as plaintiffs. Both parties are makers of an abrasive material used for stone sawing and rubbing, metal and glass rubbing, and similar purposes. The Diamond Steel Co.'s trade mark consists of an irregular crystal with radiating lines of light, and has, by the fact of being so well known throughout the whole trade, become a symbol for the Diamond Steel Co. products. The mark under which the Pittsburg Crushed Steel Co. has sold their products in America is a lozenge or rhombus with the letter "S" in it. By aid of some clauses in the American law referring to "unfair competition," they have since August, 1895, been trying to persuade the Law Court of the United States that the Diamond Steel trade mark was an infringement of theirs. But in the end the attempt has proved unsuccessful.

TENDERS.

ALNMOUTH.—For the erection of a house, Argyle-street, for Mr. Chas. Nettleship. Mr. G. Reavell, jun., architect, Alnwick.

Masonry.—John Armstrong, Lesbury, Nor-
thumberland... £213 17
Joinery.—Done by employer.
Plumbing.—Wilkin and Dickman, Alnwick... 45 19
Tiling.—Jos. Purdie, Alnwick... 32 17
Plastering.—Thos. Darling, Alnwick... 48 18
Painting.—Jas. Wallace, Alnwick... 10 9

BRISTOL.—For the erection of schools, Hotwells, for the School Board. Messrs. La Trobe and Weston, architects, 20, Clare-street, Bristol:—
H. A. Forse... £2,375 W. Church... £2,267
E. Walters... 2,375 J. Perkins... 2,260
E. Clark... 2,325 Geo. Humphreys... 2,167
E. Love... 2,287 *Accepted.

Plumbing.
S. Mason... £198 19 3 1/4 H. Povey... £141 0 0
J. James... 165 0 0 G. F. Tuckey... 185 0 0
J. Wilkins... 145 0 0 A. Scull... 184 10 0
[All of Bristol.]

CHINGFORD (Essex).—For erecting a block of three shops at Chingford. Mr. J. Edward Still, architect, 82, Queen-street, E.C.:—
Oliver... £4,395 Castle and Son... £3,660
Dabbs... 3,900

CLOWN (Derby).—For additions to schools, for the School Board. Messrs. Rollinson and Son, architects, 13, Corporation-street, Chesterfield:—
G. Haynes... £270 0 0 C. Levick... £267 15 0
J. Turner... 766 8 0 J. Fidler... 696 0 0
J. Collingham... 761 0 0 J. Jackson, Whitwell (accepted)... 632 19 2

LONDON.—For making up private roads, for the Hornsey District Council. Mr. E. J. Lovegrove, Engineer and Surveyor to the Council:—

	Queen's-avenue (First Section).	Mattison-road (Second Section).	Bedford-road.	Eastfield-road (extension of).
Nowell and Robson	£3,737 0 8	£252 14 0	£1,025 4 0	£234 6 9
Mowlem and Co.	3,636 19 6	931 13 1	1,000 17 1	325 1 1
J. A. Dunmore	3,615 11 6	923 12 6	997 6 6	327 8 8
Neave and Son	3,573 2 6	922 19 2	979 18 0	318 2 11
Williamson and Son, Limited	3,571 0 0	914 19 6	985 9 0	324 0 0
E. and A. J. Nicholls	3,563 3 0	916 0 5	979 0 0	321 4 8
Geo. Bell	3,560 0 0	918 0 0	978 0 0	317 0 0
J. E. Bloomfield	3,557 2 6	918 15 6	978 3 8	316 7 0
F. A. Jackson and Son, Limited	3,556 0 0	911 0 0	981 0 0	316 0 0
Killingback and Co.	3,555 0 0	907 0 0	983 0 0	319 0 0
W. Griffiths	3,547 13 2	901 3 0	970 5 5	311 6 2
Thos. Adams (accepted)	3,387 13 11	874 15 2	944 7 9	324 4 0

DEVONPORT.—For alterations to business premises, 16 and 17, Cumberland-street, for Messrs. Josiah Clark and Son. Mr. Edgar M. Leest, architect, 109, Fore-street, Devonport:—
T. Jenkin and Son... £158 15 1/2 W. J. Oliver... £145 0 0
S. Perkins... 140 10 [All of Devonport.]

DOVER.—For the erection of boiler-house, &c., Marine Parade, for the Town Council. Mr. H. E. Stillgoe, C.E., Town-hall, Dover. Quantities by engineer:—
R. W. Paramor... £1,099 0 0 Locking Joint, Read-Austen and Lewis, 1,078 5 10 ing (accepted)... £975 0 0

DUDLEY.—For the erection of grammar school and house, St. James's-road, for the Governors. Messrs. Woodhouse and Willoughby, architects, 100, King-street, Manchester:—
R. Wilcock... £3,265 0 W. H. Gibbs... £7,120 0
C. A. Horton... 7,769 0 J. Harley and Son... 6,900 0
H. Gough... 7,510 0 J. Buxton... 6,800 0
G. Brown... 7,385 0 J. H. Whittaker & Co. 6,700 0
R. Thompson... 7,372 0 Webb & Round, Dudley (accepted)... 6,675 0
Holland and Son... 7,290 0

EAST MOLESEY.—For making up Seymour and Beauchamp roads, for the Urban District Council. Mr. J. Stevenson, Surveyor, Council's Offices, East Molesey:—
Free & Sons, Wimbledon... £294 [Clift Ford (informal)] *Accepted.

ELTON.—For the erection of an inn, for Messrs. J. W. Cameron and Co., Ltd. Mr. E. A. Whigham, architect, 59, High-street, Stockton-on-Tees:—
H. F. Linton and Son... £2,216 2 1 A. J. Cooke... £1,958 0 0
A. Atkinson and Co. 2,116 9 10 Tees... 1,877 0 0
*Accepted.

FINEDON.—For erecting six houses, Banks and Well-street, Finedon, for Mr. C. Lilley. Messrs. Mosley and Anderson, architects and surveyors. Goodyear-chambers, Northampton, and Finedon. Quantities by the architects:—
T. and C. Berrill... £1,496 0 A. J. Ball... £1,260 0
Coates and Son... 1,420 0 J. Nicholls... 1,199 10
S. Abbott... 1,367 0 Johnson and Son... 1,199 10
F. Henson... 1,350 0 Earls Barton*... 1,199 0
T. Chapman... 1,298 0 *Accepted.

FINEDON.—For erecting a dwelling-house, with shop, etc., Wellington-road, Finedon. For Mr. T. Holly. Quantities by the architects:—
T. and C. Berrill... £215 T. Chapman... £245
R. Marriott... 749 F. Henson, Finedon*... 640
A. J. Ball... 675 *Accepted.

HENDON.—For the supply of about 18 tons of 5in. cast-iron pipes and specials, for the Urban District Council of Hendon. Mr. S. Slater Grimley, engineer:—

	Sewage Outfall Works.	Hyde Sewerage flanged pipes per ton.
Macfarlane, Strang, & Co.	27 0	213 10 0
Pulsometer Engineering Co.	6 10	14 10
E. and W. Haley	6 0	10 0
Stanton Ironworks, near Nottingham	5 10	13 0
Blakeborough and Son		9 17 3
		9 10 3

KIRKCALDY (N.B.).—For the construction of reservoirs, &c., for the Waterworks Commissioners of Kirkcaldy and Dysart. Mr. W. D. Sang, C.E., Kirkcaldy:—
James Osborne £108,505 4 1 Alex. Brunton
and Son... £74,946 0 10
Sons... 97,250 2 0 Andrew Waddell

THE SOCIETY OF ARCHITECTS.

FOUNDED, 1834; INCORPORATED, 1893.
The FOURTH ORDINARY MEETING of the Society of Architects, for the Session 1897-1898, will be held at the Rooms of the Society, at St. James's Hall, Piccadilly, W., on THURSDAY, FEBRUARY 24th, 1898, at 8 o'clock p.m., when a paper will be read by Mr. G. A. T. MIDDLETON, A.R.I.B.A. (Member), entitled, "EGYPT THE BIRTHPLACE OF ARCHITECTURE," illustrated by Limelight Views. LADIES' NIGHT.

ELLIS MARSLAND, Hon. Sec.
MONTAGUE BALDWIN, M.A., Sec.

TO BUILDERS.—WANTED, to Contract for Brickwork, labour only. Cottages or Villa preferred. In or near London.—N.E. Maypole Estate, Bexley.

R.I.B.A., SOCIETY OF ARCHITECTS, and CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparations by correspondence or in residence. Fourteen first places.—G. A. T. MIDDLETON, 19, Craven-street, Strand, W.C.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, and twelve months' courses. Any subject taken separately. Special three months' course for any of the Exams. at reduced rate.—For full particulars apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to British Museum).

WANTED, MORTISING MACHINE and Two JOINER'S CRAMPS.—Address FOREMAN, 26, Carson-road, West Dulwich, S.E.

"EMPRESS" SMOKE CURE.

The "Empress" Smoke Cure has held its ground with constantly increasing sales for many years, and is now widely recognised as the best chimney-pot.

Full Particulars of Sizes, Prices, &c., on application to the Makers—

EWART & SON.

WITH SURVEYING AND SANITARY SUPPLEMENTS

An Architectural Causerie.

One's Second Client.

ONE'S unusually lavish experiences of early clients brought one to the conclusion that the British Public, or that section of it from which early clients are derived, were divided into two parties: those who regarded one seriously, and those who took one lightly. The former believed one had adopted the Profession as a recreation; the latter that one had become an architect for fun! One's second client (who, like one's first, sprang from a friend) was of this last order. He remarked how "nice" it must be; one replied, "Oh, it's 'nice' enough when there are plenty of jobs." One's client carried this saying away with him to his suburban residence, and appeared to keep it warm in his mind so that it took root there, and began to swell and germinate, with the result that a few days later one's client, with a flashing eye and a burning cheek, cast himself precipitously into one's presence, and revealed his interesting condition. He had determined to build himself a house—an ultra-suburban house, by his description. One assured him he could not do a more sensible thing. One called him "old chap!" That overwrought him, and he gabbled; but one caught his enthusiasm; one also caught an inkling of the sort of house he desired. Without delay one began to plan one's first commission. One made sketch plans and elevations. One's client sucked their blood, and flung their discarded bones from him. They served to whet his appetite. One prepared others. By that time his views as to what he wanted were completely changed. He ceased to gabble; he became discriminating, and abounding in logic. More sketch plans and elevations. He ceased to visit one's office. One used to travel out by a suburban line with rolls of drawings, hurry through a rather bad dinner, and then sit till midnight following one's client round and round in a circle of objections and suggestions. A lot more plans and elevations. One's client became uneasy about the staircase; he could not get rid of the idea that there was a step too few. Upon the occasion of these interviews it became customary for one to open regularly with a lecture on staircases, illustrated by diagrams. Some more plans and elevations. One's client, having exhausted his own ingenuity for raising questions and suspecting errors, began consulting his friends; and after dinner he would produce old envelopes scribbled over with various house-building scares gleaned during the day. One's enthusiasm was long since dead; one grew weary of the whole business. More plans and elevations. One's client had at last exhausted his powers of dissent, so far that upon one evening the staple object of discussion was a distrust and terror he had of ceilings and doorways. He was suddenly filled with a horror lest he should bump his head. In turn every part of the design was subjected to the inquiry: "Would one's client bump his head there?" At last he began to show signs of giving way; one snatched an opportunity and won his permission to prepare the contract drawings.

Then a change seemed to come over one's client. When one met him, he seemed a weary—as though a great joy had gone out of his life. Finally, when it came to the matter of getting tenders, one's client said he wished to consider the matter; it was no good being in a hurry; it was possible he might not be able to build just yet; he had not made up his mind. In the end he told one, in a tone of cheerful resignation, he had been obliged to give up all idea of building his house for many years to come, but he would be glad to keep the drawings as a memento. One's client was piqued at one's disappointment, but it was when one sent in one's little account that one gave him the cruellest stab of all. One's claim was very much less than one was entitled to make—it was payment only for a fraction of the time and work he had demanded of one; but one's client was crushed and broken in spirit by it; he felt he had cherished a viper in his breast, and resented one's ingratitude; but the manner of his resentment lacked dignity. It took the form of beating one down and haggling for odd sovereigns. He wrote profusely, but he never called. For three weeks, one lost on an average 4s. 9d. a day off one's little account. A hardened

Eleven months later the finishing touch came that was to crown one's second client king of all one's other early clients. One morning one opened a letter from him couched in friendly and familiar terms. Its tone of frankness indicated as though the trouble had been forgotten. One's client had written to say that he had introduced one's name to a friend who was enlarging his bank premises, and, as the work would actually be built at an early date, he had no doubt one would be ready to return the fee he had paid one in consideration of the introduction. One answered that letter by return of post. One has never since heard of one's second client, nor of his friend the banker.

B. C.

An Old Grievance.

THE unsatisfactory result of so many architectural competitions is a standing grievance, and the source of perennial complaint. Does it ever occur to us that there may possibly be a complete misunderstanding between the promoters and the competitors, which may partly account for this? When a competition is advertised,

Pounds
Bridge.
The Land.

business man would have been worn away by the process. One's client had tipped one at school—he held a trump card in that. One heard from a mutual friend of one's client's anguished sense of wrong. "Here's a young fellow," he had exclaimed, "here's a young fellow only qualified a year or two; with no standing, no fortune, and everything to make. I've given the fellow his dinner—I was glad to do that—but I've sat here with him till midnight dozens of times giving him the benefit of my experience, and now here he's charged me thirteen guineas, if you please, and the house not even built!" Finally, when he had reduced one's fees by half, one lost patience, and referred him to one's solicitor. A fortnight later one got one's account in sovereigns instead of guineas, and in the form of a second-hand cheque and a postal order. One's client dropped into the great mbo of lost friends, and one forgot him.

we are too apt to imagine that the promoters thereof want a building that is Architecture, as we understand the word, when they more probably want something that is Architecture as they understand it, which seems to be a different sort of thing. Do the promoters want one thing, while the competitors do their best to supply them with another? It is needless to point out that a building may be substantial, sufficiently convenient in plan, and have an appearance calculated to tickle the palate of a vestryman, and yet not be Architecture. Might not this be, to some extent, the reason why promoters so often go behind the award of the assessor? A design may be chosen which shows some grasp of the programme as a whole, that has a good general scheme of construction, which is expressed on the elevations with dignity and reticence—in short, that is a work of Art. The promoters may prefer another—for a

thousand foolish reasons that have nothing to do with the case—that, whatever it may be, is not a work of Art. Now, if this is the sort of thing they want, there is no practical reason why they should not have it, only they should not advertise a competition for architects, because it is misleading. An architectural competition is a competition in Architecture, and Architecture is the Art of building; architects are men who practise this Art. This is a distinction that should be appreciated and borne in mind; the architect who practises the Art of building, as distinct from the man who practises the practice of building. Do the promoters of most competitions really want a work of Art—Architecture—which is one thing, or do they want a building that merely answers certain requirements and fulfils certain conditions?—which is another thing. This is a point that should be clearly understood from the first, then we should know how we stood. If a work of Art is required, it is imperative that the conditions be such as render Art possible, which is not often the case; but if what is wanted is a sort of packing-case, into which the accommodation can be crammed in a more or less convenient manner, with no more real expression on its exterior than is usually to be observed in a packing-case, this does not come within the definition of Architecture, and consequently does not concern architects. It is possible that invitations are often issued to "architects" for lack of a more exact word—that they do not mean what we mean by this term. When an architect happens to compefe, therefore, he finds himself out of his element, and need not be too much astonished if his Art is not appreciated, considering it was never asked for or wanted. It may sometimes happen that his arrangements suit the popular idea, and so he may win, and the promoters, without knowing it, get more than they wanted; but this is just pure chance. In regard to many recent competitions, judging from the conditions issued and the award that is afterwards made, we can only feebly wonder what it has to do with architects, and where the Art comes in. This is not as it should be, but this is how it is, and it is as well to recognise the fact. Why can it not be clearly and definitely stated in the conditions of every competition—particularly in such as have been drawn up by an assessor—whether Art is really wanted or not? then we should know what to do. If it is wanted, we should expect to find everything arranged with that end in view, and to see the award go to a work of Art. If it is not, then an architect competes at his own risk, and must expect all he gets. Let us have the rules of the game laid down at the beginning, and mutually understood and abided by, then we shall know whether it is worth our while to take a hand.

A. R. J.

THE plans prepared by Mr. Harpur for the alteration of the Cardiff Post Office for municipal purposes have been approved.

AN inquiry has been held at Hyde into an application by the Corporation for power to borrow £15,400 for private street improvements, and for the Board's approval to the disposal of certain lands.

A NEW mission hall and parish room has been opened at Cutnal Green, Droitwich. The room has cost some £300. Messrs. L. Shepard and Sons, of Worcester, were the architects, and Messrs. Emuss and Harris, of Droitwich, the builders.

THE contract for the construction of the new Leith line to the foot of Leith Walk from Abbeyhill, which forms part of the North British Railway Waverley Station Improvements Acts, has been let to Messrs. James Young and Sons, Edinburgh. The contract price is between £90,000 and £100,000. It is stipulated that the line is to be finished by 1900.

EXPRESSION IN GREEK ART.

By J. F. WHITE, LL.D.

IT is often said that Greek Art excels in beauty, symmetry, and form, but lacks expression. The first part of the statement, remarked Mr. J. F. White, LL.D., in lecturing at Dundee on "Expression in Greek Art," no one would deny; it was the latter part that he would deal with. There were two forms of expression—that which was permanent and abiding, which a painter sought to give to the portrait of a man; and that which was the passing expression of some transient feeling of joy, or sorrow, or surprise. In the fifth century before Christ, the Greeks dealt with the abiding expression; in the fourth century they developed into the more fleeting and transient expression; in the third and second that practice became greatly exaggerated; and in the first it was carried to such an extent that it led rapidly to decay. It must be admitted that it was extremely hard for Christians and moderns to get into a position

FOR VIEWING THE GREEK MIND.

With their different ideas of life and death and a future state it was difficult for them to get at the intellectual and moral standpoint of the Greeks in regard to these subjects. People of to-day must be careful when saying that the Greeks did not express in sculpture the attitude of the gods to them. People to-day were so much imbued with the fables and foibles of the Greek gods that it was hard to believe that in the fifth century B.C. the Greeks did believe the gods they worshipped in human form were the rulers of the world. Zeus was to the Greeks the saviour of the world, and mercy and justice sat on his throne. Mr. Farnell, in his recent book on "The Cults of the Greek States," went so far as to say that the belief of the Greeks, so far as Zeus was concerned, was a modified monotheism; but he (the lecturer) would go further, and say that, with exception of the excrescences that disfigured Greek life, their moral law was not so widely different from that of Christians. It was Zeus and Athene, his daughter, the goddess of wisdom, who guided the people in the way of civilisation, that Pheidias tried to embody in his great statues in the fifth century. That he succeeded fully antiquity told them. Lucian said Pheidias made a revelation of Zeus to the Greek mind; and Quintillian said he added new dignity to religion.

EXPRESSION WAS OF SLOW GROWTH

in Greek sculpture, for the Greeks were extremely conservative, notwithstanding their love of new things, and they studied principally at the games, so that the face was neglected owing to the attention given to the body. Mr. White remarked on the dignity of expression given in statues to dying Greek warriors, and the absence of the expression of pain except in the case of enemies. The only difference the Greeks made was in favour of the Amazons, whom they represented as fine and dignified women. He also spoke of the sad expression on the features in their tomb sculpture, and said they thought that the dead would continue their ordinary life. If Ruskin had seen these pictures he would not have said the Greeks were incapable of expressing sadness in the presence of death. Passing on to treat of the change from the ideal to the realistic, which marked the fourth century—from the wars with the Titans and Centaurs to the subjects of everyday life—he spoke of the work of Praxiteles, and then dealt with Scopas, who carried emotion almost to passion, and which found its full development in the Laocoon, in which there was an expression of agony that was painful. That led to a reaction which went back to the true traditions of the fourth and fifth centuries and to the formation of an eclectic school. As a result of this reaction they had the Venus of Melos, in which they found the monumental character of Pheidias the grace of Praxiteles, and the emotion of Scopas.

"NATURAL ARCHITECTURE."

By PROFESSOR AITCHISON, R.A.

THE annual dinner of the Cardiff, South Wales and Monmouthshire Architects' Society was held a few days ago at Cardiff. Mr. C. B. Fowler (president) occupied the chair.—Canon Thompson, D.D., submitted the toast of the evening, "The Local Society and the Royal Institute." The citizenship of Cardiff was something to be proud of, and those who had watched its progress during the last quarter of a century knew what a critical period had been gone through in laying the foundations for a great community, and that was no small incentive to members of the architectural profession who had made themselves distinguished, or to others who were to become distinguished in the future. After referring to Architecture as being, next to literature, the most eternal of the Arts, the reverend gentleman advised a close study and the acceptance of the Renaissance style as compared to the Gothic, because of its perfect symmetry and exquisite proportion.—Professor Aitchison, R.A., following the chairman in reply, said it was the duty of local societies to follow the particular forms in Architecture that were most suitable to the districts in which they resided, because the buildings must be associated in some form or other with the scenery and surroundings. The Royal Society had done a great deal, and hoped to do more, in the direction of gaining an intimate knowledge of the Architecture in different parts of the world. Its examination for associates was most valuable, and he was pleased, when in Brussels recently, to hear the encomiums passed upon the standard and character of the work of these associates. The ideal of architects was to make their buildings like Nature makes her own, and while making them beautiful yet endow them with a strong character. The charms that could be added to Architecture were such that no effort was too great, in his opinion, for those who possessed the genius to bestow it upon their country. The greatest makers of Architecture provided examples at a time when the people were trying to give the greatest attention to form and character, and most of those were in temples built to their gods. If the lessons thus taught were added to the lessons taught by Nature, they must make an immense advance. Before long he believed that the younger generation of architects would suddenly burst forth into an enthusiasm that England has never before seen, and with the Divine gift of genius would spare no time to bring it forth, so that England may be like Greece, Rome, Italy, and France—a place where the people come to admire that which is high, noble, and beautiful. In conclusion, he again hoped that England would be one of the countries that people from all parts of the world would visit to see how its high expressions of beauty and utility are cultivated.

POUNDS BRIDGE.

POUNDS BRIDGE, which we illustrate on our front page, is one of the many good examples of half-timber work which abound in the neighbourhood of Tunbridge Wells. It is within a walk of Penshurst Place, the ancient seat of the Sydneys, and the picturesque village of that name, which ever attracts the architectural enthusiast. Pounds Bridge, now an inn, was probably the residence of some servant of the castle at Penshurst. It stands at the junction of three roads, down one of which its front can be seen through a short avenue of trees. The scenery round is picturesque to an almost romantic degree, with wooded dales, spotted with pretty villages made up of cottages of a similar type; with occasionally, the additional charm of a grey and ivy-clad church. Many delightful hours may be spent in the district with sketching book and camera, and the student of ancient domestic Architecture will find here a happy hunting ground.

THE CONSTRUCTION OF FIVE FAMOUS DOMES.

BY JOHN A. MARSHALL.

V.—THE DOME OF ST. PAUL'S, LONDON.

It cannot have been overlooked that each succeeding stage of domical development, as illustrated in these papers, affords evidence of an increasing disposition to give to the dome a more imposing appearance externally. It was mainly with a view to the attainment of this object that the innovations about to be noticed were introduced in St. Paul's. At the same time, the claims of the interior could not be ignored, and thus both the increase of the external elevation and the restriction of the internal height became important factors in the design.

In each of the four examples already considered, alike when viewed from the inside and the outside, practically the same dome is seen; and it certainly seems most fitting that one should serve for both roof and ceiling. But, as has been ably pointed out, if one dome is to serve both these purposes, it cannot be made "artistically perfect"; for, if the height be restricted to what looks well from within, it will be too low for external effect, as seen in the Pantheon and in Sta. Sophia; on the other hand, if elevated so as to be imposing externally, the interior will either be lost in obscurity, or, at the best, appear quite disproportionate; of this St. Peter's is an example. The dome of the Duomo comes most nearly to satisfying these contrary requirements; and the architect of St. Paul's has also kept, in its interior, the same proportions, i.e., two diameters in height; while, for external effect, he has provided a separate and distinct dome, making the height equal, in proportion, to that of St. Peter's. The great depth of the intervening space seemed to demand the provision, between the domes, of some other and independent support for the stone lantern, and to this necessity we are indebted for that master-stroke of genius—the introduction of the cone.

The general design of the Dome of St. Paul's bears unmistakable indications of a careful study, by Wren, of the great work of Michael Angelo. But the English architect aimed—and, it must be admitted, with considerable success—at the production of the desired effects by the use of the slightest materials compatible with sound construction. Evidence of this is also traceable in the supporting structure, where even the piers are so arranged as to offer the least obstruction.

The leading idea for the central compartment is a regular octagon, open at all sides to the several extensions.

Imagine four massive piers rising from the angles of a square, and occupying the same ground area, as do those in St. Peter's. The aisles, however, instead of terminating dead against them, as in the earlier church, are continued through to the central compartment, thus effecting the subdivision of the four supports into twelve separate piers. Eight of these, each 28ft. 6in. by 15ft. on plan, circumscribe the octagon; the remaining four occupy the outer angles of the square. The latter are built hollow, and take none of the superincumbent weight; their primary purpose being to resist the thrust of the barrel vaults, which, at the height of 65ft. from the floor, span the four main openings. With a width of 40ft., each of these occupies nearly the whole of one side of the octagon; while, to correct the apparent weakness of the supports at the angles, the intermediate openings are reduced in width to 28ft., and divided into two tiers; the recesses beyond, formed by the intersection of the aisles, being vaulted by semi-domes. To secure uniformity in the pendentives which spring from the angles of the octagon, the arches over the upper tier extend beyond the openings, so as to range, and in size correspond with those on the other four sides.

At this stage is seen what is the least satisfactory portion of the whole design. The

width of the main extensions is so contracted as to be out of all proportion to the central compartment; and, in making the openings to these extensions as wide as possible, the whole eight arches are brought so closely to each other as to give, at first sight, the appearance of the superstructure rising from eight mere points. This impression is somewhat modified by the wall of the drum being set back from the inner face of the octagon, which arrangement admits of the formation, at the height of 100ft. from the floor, of what is popularly known as the "Whispering Gallery." Another, and a more important, result is that the pendentives by which, at this level, the octagon is converted into a circle are relieved of all weight beyond that of the cornice and balustrade of the gallery. The great projection of this cornice assists still further in disconnecting the upper part of the design, and the apparently weak supports below.

From this level the influence of St. Peter's becomes still more manifest. The drum is divided into two stories—the basement, which is quite plain, and the upper story, enriched with the peristyle, and pierced with windows. The basement is of much lighter construction than that of St. Peter's; and consists of a thin wall, concentric with, and about 8ft. distant from, the inner wall of the drum: the two being connected by piers, on which are erected the counterforts of the peristyle. Round the outer wall, at intervals, are placed low buttresses, which are concealed beneath the roofs and afford a broader base for the superstructure. The space between the walls—containing galleries—is covered with a flat roof of timber, overlaid with lead.

A peculiarity of the drum must not pass unnoticed. This is the slight inward inclination of its wall, which gives to it the form of the frustum of a cone. This innovation may have

ST. PAUL'S - LONDON -

been introduced with a view, primarily, to its effect on the foreshortening; but it cannot fail to increase the resisting power of the drum. The height, from the level of the "Whispering Gallery" to the springing of the dome, is 60ft.; the internal diameter at the bottom is 109ft., and at the top 102ft.; the thickness of the wall above the basement is about 4ft.

The peristyle of St. Paul's is far more elegant than that of St. Peter's. The grouping, in the earlier instance, gives place, in the later, to equal inter-columination, and the entablature is carried round in an unbroken line. Each column, instead of having a solid backing of masonry its whole height, has only its upper part connected with the inner wall, and this in a manner so unobtrusive as hardly to encroach on the simple dignity of the colonnade. The architect, however, deemed it unwise wholly to rely on this slight abutment, which he increased by filling in every fourth inter-columination; and thus, at the same

time, provided facilities for staircases. The smaller counterforts are also strengthened by arching over the intermediate spaces, behind the entablature, whereon is laid the floor of what is known as the "Stone Gallery." Mr. Worthington, in his admirable prize essay on this subject (Transactions, R.I.B.A., 1890), mentions that each counterfort is secured to the drum in the upper part by two iron ties or cramps, the whole being encircled by a chain embedded in the architrave of the peristyle.

In giving to the structure greater importance externally, while preserving the symmetry of the interior, it was found desirable to raise the peristyle 15ft. higher than the inner wall of the drum. An important structural advantage over St. Peter's is here secured in the abutment thus provided to the lower dome.

In dealing with the remaining portion of the structure, it will be convenient to consider, first, the inner dome or ceiling; then the cone

supporting the lantern; and, lastly, the outer dome or roof.

The lower dome has an internal diameter of 102ft.; its radius, drawn to the vertex, makes, with the vertical, an angle of 10 degrees; and the thrust, which is consequently less than if the section were semicircular, is still further reduced by the omission of the crown, the opening being about 20ft. in diameter.

It is constructed of ordinary bricks, except that at every 5ft. in the height a course of 18in. brick passes through its entire thickness for the purpose of binding it. Having no extraneous weight to support, the slight thickness is fully adequate to all structural requirements. The haunches are filled in solid to a level of about 20 degrees from the base, and thus is provided a firm foundation on which the cone is erected.

This novel feature of St. Paul's has been justly pronounced "one of the most elegant applications of science ever introduced into a building." It meets the necessities of the case more completely than any other contrivance could have done, and that with the smallest outlay of material. It not only affords the firmest support to the lantern, but by its means the desired elevation is most readily attained. Indeed, in both these respects the capacity of the cone is well-nigh unlimited. Its form admits of its being carried to almost any height with perfect ease and safety, and it receives an accession of strength with every approach of the angle of its inclination toward the vertical. Seeing that the pressure is confined to a straight line within the thickness, the risk is not of bursting, as in a dome, but rather of spreading; and if the cone be secure at its base, the risk is—as Ware has well put it—"concentrated in the fragility of the material."

The cone in St. Paul's has an inclination of 24 deg. with the vertical, and an internal diameter of 100ft. at the bottom, and of 80ft. at the top, where it terminates in a cupola, which supplies, at the height of 90ft. from the base, the strongest form of foundation for the lantern; and is also a fitting termination to the vista obtained from below, through the opening in the lower dome. The cone is built of brick, 18in. in thickness, with six bands of stone, each containing an iron chain run with lead. A double iron chain, linked at intervals of 10ft., and bedded with lead in a channel cut in the stonework, checks any tendency to spread at the base, while also aiding to secure the dome at its haunches.

The liability of the cone, by reason of the extreme tenuity of its shell, to fracture, in case of disturbance in the substructure, is greatly increased by the weight of the lantern; and it was, doubtless, this danger that suggested the insertion of the additional ties, in stone bands, at different levels between the base and the summit. The numerous apertures in the cone, in addition to reducing its weight, answer the not less important purpose of limiting the extent of possible fractures, and also serve for lighting and ventilating the internal spaces. The power of resistance to pressure, residing in the domical termination of the cone, is severely tested. Though the thickness of the shell is only one-twentieth of its span, and though it is still further weakened by the loss of nearly one-third of its mass by openings, it has proved fully equal to the task of sustaining the enormous estimated weight of 700 tons. It must be remembered, however, that this vast weight is not borne by the crown—which is open to the lantern—but distributed over the haunches.

In a triple structure like the dome of St. Paul's, it is clear that the limitation of the weight is a question of the first importance; and, with the united weight of the lower dome, and of the cone and lantern, already pressing on the wall of the drum, the use in the construction of the outer dome of timber, rather than some heavier material, was, no doubt, recognised as a practical necessity.

In order to give to the external dome the desired elevation, a second drum, or attic story, is raised on the lower drum to the height of 25ft. above the peristyle. This additional feature contributes greatly to the general symmetry of the structure. Thin cross walls,

at intervals of about 8ft., and pierced in order to reduce their weight, connect the wall of the attic with the cone. These receive the thirty-two radiating frames of oak which support the curved ribs of the outer dome. The ribs are 11½ in. by 10 in. at the bottom, and 6 in. by 6 in. at the top. The framing is almost entirely dependent on the cone, in which, and passing quite through the thickness, are inserted stone corbels, which receive the ends of the horizontal timbers of the different stages; these timbers being fastened to the corbels with iron cramps. The ribs are tied in, at intervals, with bands of iron; while between them, at short distances apart, and following the curvature of the dome, horizontal timbers are framed and boarded. The ribs have a slight projection on the exterior; the whole of which, instead of being covered with copper, as was originally intended, is covered with lead.

To light the interior of the cone a somewhat ingenious method is adopted. In the upper part of the outer dome, every alternate couple of ribs is cut short, and eight wells are formed in the framing around the base of the lantern; thus providing accommodation for windows, through which, and corresponding apertures in the summit of the cone, light is transmitted to the space below.

The gallery of timber immediately above serves as an artistic connecting link between the dome and the lantern. The latter rises at the height of 275ft. from the floor of the church to a further altitude—including the metal ball and cross—of 85ft. Roughly speaking, at the base it is 22ft. square; the interior, which is octagonal, being about 11ft. in diameter.

In attempting to form a just estimate of the dome of St. Paul's, it should not be overlooked that in St. Peter's, where similar difficulties existed, they were, at least, honestly faced; but Wren, as if deterred by their formidable character, turned aside from the legitimate path, by disregarding, to a great extent, the capabilities of the dome. Hence, so far from St. Paul's presenting a satisfactory solution, it ought rather to be regarded as a skilful evasion of the problem.

Further, the pre-eminently scientific character of the construction has involved a great seeming waste of space (still leaving the lower dome much too high for proper effect) and has also necessitated the use of material of a perishable nature; while "the fabric"—to quote the words of an eminent authority—"is not to be safely trusted to the independent strength of its own construction." Still, taking into consideration the difficulty of reconciling the opposite requirements of the exterior and of the interior, and the ingenious application of the cone to accomplish that purpose, the architect may well be excused, and his fault condoned—if fault it be—in presence of the matchless symmetry and unequalled grandeur of the noble exterior.

HISTORICAL SKETCH.—In a report drawn up by Sir Christopher Wren on the proposed restoration of the second Cathedral of St. Paul's, appears the following passage:—"I cannot propose a better remedy than by cutting off the corners of the cross, to reduce this middle part into a spacious dome, or rotunda, with a cupola, or hemispherical roof, and upon the cupola a lantern with a spiring top, to rise proportionately." But, fortunately for Architecture, the Great Fire of 1666 occurred, and prevented the perpetration of such an anomaly as the crowning of a Gothic cathedral with a classic dome.

The necessity for an entirely new edifice led the Dean to give to Wren instructions to prepare a new design, unfettered by any conditions. This design was regarded with special favour by the architect himself; the clergy, however, raised objections to it; but a third design met with unanimous approval.

No sooner had the excavations been commenced in 1674, than the Chapter altered their minds, on the plea that the plan was not in harmony with the traditions of Christian Architecture. A fourth design was finally accepted, but totally transformed during the progress of the work. The first stone was laid in 1675; in 1710 Wren's son laid the last stone of the lantern.

GREAT ART WORKERS OF THE CENTURIES.

INIGO JONES, ARCHITECT.

ALTHOUGH pride of place is more frequently bestowed upon Sir Christopher Wren as an architect, and although in this connection no one will grudge him his position, there is no gainsaying the fact, to my mind, that, although the greater in construction, he was certainly the inferior of Inigo Jones in design, and the reader can look along the pages of history and seek in vain for one who is his equal as an artistic architect, he taking first rank in England during the Renaissance period. The subject of these lines was born in West Smithfield in 1572, dying in 1652. Very little is known of his early days, but he showed such an aptitude for,

ST. PAUL'S, LONDON.

and love of, the Fine Arts, being a landscape artist of no mean merit, that the third Earl of Pembroke sent him to Italy to be educated, his parents being too poor to defray the expense. So well did he profit by the opportunity that he was invited to Copenhagen by King Christian of Denmark, as Court Architect, and he afterwards accompanied the Queen to London, when he immediately became Inspector-General of the Royal buildings, though in 1612, on the death of Prince Henry, he returned to Italy, in order to complete his studies, being

ANXIOUS TO MASTER THE GREAT PRINCIPLES which guided the Italian architects in their work, which to his mind was as near perfection as possible, a dictum to which probably many of my readers will not give too ready assent. His visit bore good fruit, for immediately on his return he produced his design for the Royal Palace of Whitehall, which, though never completed, is in the noble and grandly-proportioned Banqueting House, now devoted to

the purposes of the Royal United Service Institution, one of the principal structures upon which his fame, certainly as an artist-architect will rest. Had the complete design been carried out, it would have been the finest and largest palace in the world, and would not then probably have passed through the stages of banqueting hall, chapel, and now museum. It was not, however, in dimensions so much as beauty of design that this palace would have taken a prominent position. The only building to compare with its internal courts is the Louvre, and that is less in height and dimensions, and has not the simple grandeur of the one under notice. Externally,

THE PALACE OF WHITEHALL

would have surpassed the Louvre, Versailles, the Tuileries, &c., by the happy manner in which the angles are accentuated, by the boldness of the centre masses in each façade, and by the play of light and shade, and the variety of skyline, all obtained without interfering with the simplicity or harmony of the entire design. As the banqueting hall now stands, the only portion of the palace ever completed, it is neither worthy of the great praise or equally great blame which has been bestowed upon it, one of its greatest faults being the solecism of having two external floors to only one apartment, but had the chapel, which was to have faced it, and the other two blocks been completed, this anachronism would have disappeared. Anyway, as a grand and solid structure, with just sufficient decoration to supply the effect intended, the building is well worthy of study by young architects, designers, and decorators, and artists should note its richly painted ceiling, by Rubens, the design being the "Apotheosis of King James I." Another of Jones's works is

ST. PAUL'S, COVENT GARDEN,

"the handsomest barn in England," as he remarked when told to build a church giving the greatest accommodation for the least expense. This church, which during the past few years has been externally and internally remodelled, is spoilt, so far as its noble Eastern portico is concerned, by the blocking up of the doorway, this being necessitated through the custom in Protestant churches of having the altar at the eastern end. Through this entrance being built up and railed in, an idea of falseness is conveyed, not lessened by the inscription thereon. Among the most successful of Inigo Jones's smaller designs, and in which he excels most as an artist, is that for the Duke of Devonshire's villa at Chiswick, which was suggested by the Palladio at Vicenza, which many claim that he improved upon. However much we may disagree with this Italian style of Architecture in these days, as being unsuitable to the variable climate of England, it must be borne in mind that in those days every one was hankering after classical models, and architects and painters having to meet the demand, it was well that they took the best models that the world could produce. There are several other specimens of his work in existence in the Metropolis, among others the west side of Lincoln's Inn Fields, formerly known as Arch Row, which will well repay inspection, though many executed by his son-in-law, Webb, are ascribed to him. That

INIGO JONES WAS AN ARTIST

is evidenced also by his being employed in the painting and manipulating of the scenic devices employed in the Court Masques, many of which were written by Ben Jonson, and in which Queen Anne acted. His son-in-law, Webb, justly wrote of him "that what was truly meant by the Art of design was scarcely known in this kingdom until he brought it into use and esteem amongst us here. He was generally learned, eminent for Architecture, a great geometrician, and in designing with his pen not to be equalled by whatsoever great masters in his time for boldness, softness, sweetness, and sureness of his touches."

W. N. B.

SOUTHPORT is to have another new church. The site will be at the top of Sussex Road, and the church is to seat 500 persons.

PHOTOGRAPHIC RECORD SURVEYS.

By G. A. T. MIDDLETON, A.R.I.B.A.

THE gradual decay and rapid disappearance for improvement's sake of much that is old and noteworthy in our country, has led many of the more enthusiastic photographic clubs and societies to organise systematic surveys of their respective districts; and more permanently useful work it would be difficult for them to find to do. Banded together under able leadership, a small body of amateur photographers could very quickly produce an album illustrating a district, a town, or a notable building, with a thoroughness not to be obtained by any other means. Proper leadership would be everything, promiscuous snap-shooting would be valueless; and it seems to us that each band of workers undertaking a definite survey should include amongst its members some one with a technical acquaintance with architectural surveying.

Obviously, the first thing necessary in a survey, even a photographic one, is a plan of the building, town, or district of which a record is wanted. It may be roughly drawn, but it must be approximately accurate; and, while the ordnance map will suffice for a town or district, a building must be measured. On this plan it is advisable to mark the position of the camera for every photograph taken with a letter or number, and the direction in which the lens was pointed should also be indicated. The work of the draughtsman being thus limited, the photographer takes a series of general views from well selected points, both of the exterior and of the interior, including within these views all details which are afterwards to be reached. Sharp, clear negatives are aimed at, and these enlarged and printed by some permanent process, the positions of various features being indicated by a number, and referred to in the index.

Photographs of these features are similarly taken, and similarly printed as enlargements, the positions of minor details being again indicated by reference numbers; and finally the details are themselves photographed, generally by the aid of a comparatively small

camera, and sometimes even by a hand camera, if fairly well lit, and so capable of being taken with a "snap" exposure.

In the result, such a record of a building is secured, in a comparatively short period of time, as could in no other way be obtained—even the most exhaustive of measured drawings falling far behind it in the important respect of general comprehensibility. Everyone can understand a photographic survey—very few, comparatively, can do more than admire the execution of a measured drawing; can, as it were, re-erect in their imagination the building which it represents. More than this, the drawing, however carefully executed, is liable to error, and at least is influenced, in the effect which it produces, by the powers of the draughtsman; while a photograph is accurate to precision, if taken for record purposes and not for effect. The difficulty of scale can always be got over by introducing a portion of a specially made, plainly marked 2ft. rule, or a portion of a levelling staff; and this is a very necessary precaution, as a finely-carved piece of decoration, which measures only some 3in. across, may well appear to be as many feet, if photographed apart from its surroundings; while, when dealing with general views, approximate scale can be suggested by the inclusion of a few human figures. Such surveys as these can be undertaken not only by the photographic societies, but by small independent bands of workers, and two or three architectural students engaged upon a series of measured drawings of any building might well supplement their work by taking photographs of such details as they might not have time at the moment to sketch.

We are not advocating the substitution of the camera for the sketch-book, but rather its addition to the outfit of the architectural draughtsman, to be used either by himself, or, more conveniently, by some companion upon the sketching tour who may not be an architect, but who may have joined the party for the sake of companionship. A combination survey obtained in this way seems ideal, and the records of such should not be lost and merely put away in private sketch books. It is difficult to advise a means of preservation, nor is it our province to do so, but we throw out the hint as worthy of consideration by local architectural societies.

KEYSTONES.

A NEW public hall and offices have been erected at Hoylake.

THE new waterworks at Leigh-on-Sea, just opened, cost some £11,000.

A FINE oak pulpit has been placed in the Church of St. Mary, Bickington.

A STAINED glass window has been erected in the north-west of West Redford Church.

THE Barry School Board has schemes in hand for the erection of six new schools in the Barry district.

THE plans for a new Baptist Chapel at Huddersfield, prepared by Mr. Joseph Berry, have been adopted.

THE new Wesleyan chapel which has been erected in Bulawayo for English services, at a cost of £5000, has been opened.

SIR E. J. POYNTER, P.R.A., has been appointed one of the Royal Commission for the Paris International Exhibition of 1900.

THE new buildings of the Reading University Extension College are expected to be completed early in June. The buildings will cost £13,000.

MR. HERBERT SPENCER's presentation portrait has now been finished by Professor Herkomer, R.A., and will be exhibited at the Royal Academy this year.

THE contractors for the erection of the proposed school at Westfield have resolved to raise an action for damages against the Aberdeen School Board for breach of contract. The sums claimed for amount in all to about £1000.

At a meeting of the Plans Committee of the Aberdeen Town Council plans of property representing £38,000 in value were sanctioned. The list included a plan of a warehouse proposed to be erected by the Northern Co-operative Company at a cost of £8500.

THE following have joined the council of the forthcoming Art Metal Exhibition, to be held at the Royal Aquarium in May-June next:—Sir Arthur Blomfield, A.R.A., Mr. Alfred Waterhouse, R.A., Mr. Brock, R.A., Sir Noel Paton, R.S.A., Sir James Linton, P.R.I.P., Sir T. Gibson Carmichael, M.P., Mr. Seymour Lucas, R.A., Professor Aitchison, R.A., Mr. Ernest George, Sir W. Cuthbert Quilter, M.P., Mr. C. Purdon Clarke, C.I.E., and Mr. Lewis Day.

LEADWORK: PLAIN AND DECORATIVE.*

By F. W. TROUP.

THE great question of milled versus cast lead I am not prepared to solve, but I may offer one or two remarks bearing on the subject. We are told by the advocates of cast sheet-lead that it turns to a silvery grey or white in the course of time, whereas milled lead always turns black on the surface. I believe there is not much doubt about the latter part of the statement, and certainly the beautiful patinas on the surface of many old roofs of cast sheet-lead go in support of the first part of the theory. But I think it wants some further investigation and proof to show that cast sheet-lead under modern conditions—which, of course, includes the metal as well as the atmospherical conditions—will also oxidise to a silver grey as white patinas. The lead used in

THE ROOFS OF ST. PAUL'S

and the buildings attached to it are, and, I believe, always have been, covered with cast lead. From these roofs we might, therefore, be able to judge conclusively, as there is a constant repairing being carried out, in which freshly cast lead is used. But I gathered from Mr. Penrose and his plumber, some years ago, that the stock of old lead was adhered to and simply re-cast, and in the stock I distinctly remember seeing, piled up in the crypt, fragments of very old lead water-pipes, and even several examples of Roman pipes. An examination, therefore, of the condition of the lead on these roofs would throw light on only one half of the question, namely, how the old metal stands and how the surface "goes" when oxidising under the modern London atmosphere. "Green oak wood, from the quantity of acetic acid which it contains, should not be used in contact with lead for building purposes. . . . The vapours of acetic acid corrode it rapidly" (Miller's inorganic Chemistry). As soon, however, as you come to ornament lead work, there is no longer any question as to whether cast or milled lead is best. With the latter you are confined to bossing, whereas in casting the sheet it is not only possible, but very easy, to imprint patterns or letters, or to ornament in the sand bed, and it is still possible to boss or beat up the cast sheet to what extent you please after the casting is complete.

TINNING AND ENGRAVING

can be done equally well on either kind of lead, but in the case of sheet lead all the work, however wrought, gains by the superior texture of the ground surface. I made some mention just now of the difference in the metals themselves, between old and modern lead. The chief difference consists in the greater purity of modern lead. Silver is frequently found in conjunction with lead ores, and formerly this was but partially extracted, but by modern perfected methods it is profitable to extract the silver if the lead contains only a few ounces to the ton. Whether this absence of silver in modern pure lead has any effect upon the colour to which the surface oxidises or wears, as some have held, I am unable to say, but I think there is no question that the old lead was somewhat harder and more self-supporting in exposed positions from its slight admixture of silver, traces of other metals with alloy being nearly always harder than the principal metal in the composition. In this connection it is interesting to note the remarks of

BURGESS UPON WINDOW LEDGES:

"Now the lead for this purpose was cast, not milled. It was also much narrower than the modern, but contained, if anything, more metal. The consequences are, that much of it is good up to the present time, while each flat board-milled window-lead, having its grain

broken by the milling, and presenting a very thin and very broad surface to the air, becomes rapidly deteriorated. At Beauvais I saw some lead which was probably put up at the end of last century quite in a state of oxidation; and at Jonnay, where the whole of the immense windows of the choir had been filled with stained glass, at no very distant period a very large expense will have to be undergone to fresh lead the whole, as nothing better than the common cottage window lead has been employed." Note here that thin lead soon oxidises and absolutely perishes altogether. The reason is very simple, and should not be overlooked. A fresh clean surface of lead tarnishes very rapidly,

WHEN EXPOSED TO THE ATMOSPHERE,

owing to the formation of a thin closer adhering film of oxide. This film protects the metal from further change, excepting that, in course of many years, it becomes (in the case of cast lead) a fine patina of variable thickness. Where the lead itself is of considerable thickness the loss of strength for this oxidation of the surface is unappreciable; but where the lead is rolled out so thin that the film of oxidised metal bears a considerable proportion of the whole thickness of the metal, it is no longer able to serve its purpose, and tears or drops away as the strain or wear and tear come upon it. Now a word as to the laying and working of lead. Whether milled or cast it matters not; there is room for much improvement of modern methods. You have only to look at the exhibits sent in by the students of the Polytechnic Classes for the prizes to see that the ideal aimed at is all wrong. The results are often wonderful and extremely praiseworthy, if only they were of any use. But the working of the lead, as at present taught, seems to me to be

LABOUR MIS-APPLIED.

What practical value is to be had from a three-branched soil pipe, beaten out of one single sheet of milled lead? The dexterity and patience required to do such work is astounding, and so is the patience and perseverance required to build a full-sized model ship inside a glass bottle—a seventh wonder to be seen in exhibitions of shop windows at times. I have, of course, taken an extreme example from what I have seen in the work of the students, but all the rest is "tarred with the same stick." Mechanical precision in lead work is not only wrong, from being labour mis-applied, but it renders the life of the metal shorter, it costs greater, often prohibitive, and certainly does no good to the woodwork it covers. Plumbers, with their 5ft. or 6ft. of milled lead, nowadays, often beat and dress it over the wood like a coat of paint. The

result is that frequently the lead cannot expand and contract freely as it should do,

TO PREVENT TEARING AND BUCKLING;

and the wood under—well, the closer you cover wood the more chance there is of dry rot, and if there is any acid remaining in the wood the more certain is it to attack the under side of the lead. I should like to see a closer following of old methods, which are invaluable, simpler, and more straightforward. My friend, Mr. Dodds, used to say he admired the old gutters, which seemed to be laid by cutting out a piece of lead the right shape and walking over it once or twice on stocking soles. That was all. Nothing more is wanted. The young plumber at the present day is taught to dress and fit the sheet hard down into every angle, and beat it close near the drip. The result is that you get the lead, as often as not, hard fixed at each end, and under a hot sun it must buckle, and under a frosty sky tear; and at each drip the water is drawn up from suction, or capillary attraction, between the two sheets of lead, and if thereby any snow is in the gutter, as likely as not the water gets up to the woodwork.

BY THE OLD METHOD

all this is left loose and easily fitting, one sheet sliding over the other where there is any expansion or contraction. There is no possibility of capillary attraction taking place at the drip or elsewhere, for the lead goes gently rounding over the drip, leaving a clear space between it and the turn-up of the underneath sheet. Nor can I see any special merit in beating things up out of a single sheet of lead when the same object can be attained more directly, more simply, and more rapidly by the help of solder. There are limits to everything, and soldering in plumber work may be overdone. But soldering seems to me to be the legitimate treatment of lead. The joining of two pieces of lead together by soldering is as pre-eminently suitable to the material as welding is for wrought iron or brazing for copper. Such problems as to beat up a rain-water head from one sheet of milled lead ought not to be set, except as a subject for students practice—a kind of study in lead working—and even then it is dangerous, as being likely to result in a

MERE DISPLAY OF MANUAL DEXTERITY

and skill, and to develop into such methods of laying and dressing lead as I have described and condemned already. After quoting the opinions of M. Felibien and Burgess on the subject of soldering, tinning, and decorating lead, the lecturer proceeded:—I would recommend those who wish to study the possibilities of the plumber's art historically to avail themselves of Mr. Lethaby's excellent little work, where they

THOMAS E. HARDY, ARCHITECT.

* Extracts from a paper read before the Architectural Association on Friday night.

will find a most interesting chronicle of the best work to be found in this country in all periods, besides invaluable suggestions and guidance for the worker in lead. I have referred very slightly to ancient examples, although, as is well known, it would be easy to discourse for hours on the multitude of beautiful examples of coffins, fonts, cisterns, pipes, pipe heads, spires, roofs, ridges, finials, &c., which remain all over this country and abroad. These form an attractive array for any student, and as every town has its examples, at any rate of the latter development of the plumber's art, an interesting study might be made of the varying types in the different localities. This, however, is not my object, and I would rather warn you against creating or reproducing old examples. What I wish to show you is the simplicity of the old methods of work, by what simple ways, almost child's play, they attained their ends. And again, from the very ease with which ornament can be applied, or wrought, to lead, you must beware of the opposite pitfall, and not imagine that you have reached the goal when you have covered your material with beautiful ornament.

LEARN THE POSSIBILITIES OF THE MATERIAL before you attempt to design in it. Architects cannot possibly study thoroughly all the materials they have to deal with, but it is always possible to study one or two, and the doing so will let in a flood of light upon all the others. This knowledge will make you very modest indeed in attempting to design with blacklead, white paper, and a "T" square. You have only to try once, by designing first on paper, and then attempt yourself to carry out the design in actuality to learn what a poisonous and deadly thing it is for a craftsman to have to follow line for line "with the architect's design." All freedom is gone; what would have been a quaint twist or an amazing blade of colour or shade, is sacrificed and killed in order to follow absolutely the black and white skeleton on paper. I say you have only to try it once, in any material you like, to find the truth of what I say. When once you have learned something about your material, paper and pencil is very useful, but you will use it in a more tentative way. Knowing that many things occur to render a slight change a necessity, in order to get the best result for what you have in hand—the drawing is but a means to an end. I cannot do better than finish by quoting from Mr. Lethaby's "Lead Work," already referred to: "New design must ever be founded on a strict consideration of the exact purpose to be fulfilled; of the proposed object, of how it will serve its purpose best and show perfect suitability to the end in view, when made in this or that material, by easy means. This, not the torturing of a material into forms which have not before been used, is the true ground of beauty, and this, to a certain extent, is enough, without any ornamentation. Ornamentation is quite another matter; it has no justification in service; it can only justify itself in being beautiful."—In the course of the lecture the casting of various designs in leadwork was illustrated, a temporary casting-table having been made for the demonstration, and this, and the appliances, were described by Mr. Troup.

(The discussion will be given in our next issue.)

TWENTY-TWO sets of designs have been sent in for the proposed technical schools to be erected in Abbey Road, Barrow.

THE new choir stalls in St. Peter's Church, Abbeydale, were recently dedicated. They are of carved Riga oak, of handsome design, by Messrs. Jones and Wills.

THE work of restoration at the Collegiate Church of St. Saviour, Southwark, has been continued since the re-opening a year ago, and further works will have to be carried out before the whole fabric can be completely restored. Among the promised gifts of the past year are several windows, which will include a Thomas Guy memorial window, the cost of which is to be raised by subscription amongst friends connected with Guy's Hospital.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

March 2nd, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE Committee of the Harrogate School of Art have received the report of the adjudicators, Messrs. Woodhouse and Willoughby, architects, Manchester, upon the competitive designs for a new technical institute for Harrogate, which is estimated to cost £5600 in addition to the site. The Committee have awarded the three prizes of £20, £10, and £5 as follows:—1, Mr. W. J. Morley, architect, Bradford and Harrogate; 2, Messrs. Bland and Brown, architects, Harrogate; and 3, Mr. J. E. Marshall, architect, Harrogate.

THE report of the Committee of the British Fine Art Section at the Brussels International Exhibition last year, just issued, states that Great Britain was awarded twenty medals—in the proportion of one to sixteen pictures exhibited—being two more than given to France and only two fewer than were given to Belgium. Very few living British artists of repute, it is stated, were unrepresented, and the report, which is signed by Sir E. J. Poynter, P.R.A., expresses the opinion that the committee may be congratulated upon having achieved an undoubted success, which has come as a revelation to Belgium, and which has been echoed throughout Europe. "Our work," it is added, "will have served its purpose if it has raised the prestige of British Art abroad, and helped to encourage our artists at home."

THE "Exhibition of International Art," which is to be held in London in a few months' time, may quite possibly, if it is judiciously managed, be a very valuable display of art examples. The executive council already includes the names of many men of note in the art world, whose judgment may fairly be regarded as likely to be trustworthy. If they exercise discreetly their privilege of deciding who are to be the artists invited to contribute, and if the response to their invitation is reasonably large, a summary of the art of the world ought to be presented. The only point that remains to be considered is whether an international show is calculated to attract sufficient support from the public to make such a venture remunerative. To the great majority of people the names of even the greatest foreign masters are unknown, and therefore the work that represents these painters does not make any wide appeal. This fact may prevent the exhibition being as great a success as it might otherwise deserve to be.

An interesting discovery has been made in the Church of the "Ognissanti" in Florence. A splendid "Pieta" by Ghirlandais, has been brought to light, containing a portrait of the great Florentine navigator, Amerigo Vespucci. This fresco, which for more than three

hundred years was supposed to have been lost, contains portraits of Vespucci's family, as well as of himself. It is in a splendid state of preservation. In the lunetta is the Madonna of the Misericordia, beneath whose mantle, which is upheld by angels, kneel on either side the family of Amerigo Vespucci, both male and female; the men on one side, the women on the other. The figures are two-thirds of life size, and Amerigo himself appears as a youth of about twenty, his actual age at the time the fresco was painted. Under the lunetta is the Descent from the Cross, the Madonna kneeling, St. John the Baptist, Mary Magdalen, and other saints. In the background is a view of Jerusalem and the Cross. The faces of the saints are supposed to be portraits, and they are dressed in the style of the fifteenth century.

The sketch reproduced on page 64 illustrates a small seaside residence built of local limestone, with Runcorn sandstone dressings to windows, &c.; and upper story in half timber and rough cast, with brick backing, and roofed with Ruabon variegated tiles. The site commands most extensive views of the Llandudno Bay and Menai Straits, Anglesey and Penmryn, and has been very successfully planted with trees and shrubs. The Little Orme forms a background and shelter from the east winds. It is the home of the architect, Mr. B. Nelson.

THE Office of Works has just taken in hand the overhauling of Hertford House, preparatory to its opening to the public. It has been found that the mansion, though in every way a splendid residential structure, is in many respects ill-adapted for the effective display of the treasures embraced in the Wallace collection, and extensive alterations have consequently been decided upon. These will be proceeded with forthwith, but probably at least eighteen months must elapse before the place can be opened to the public.

INTERESTING relics of Roman Paris, the old Lutetia, have been discovered on digging 16ft. deep the foundations for a house in the Rue du Cloître-Notre Dame. There are traces, for a length of nearly 200ft., of a wall 9ft. thick at the base, and consisting of blocks of stone which had evidently served for an older building and been hastily put together. Many of these blocks bear Latin proper names, still more or less decipherable, though rudely chiselled. It is believed that these inscribed blocks were the tiers of an amphitheatre, another portion of which was discovered in front of Notre Dame in 1847. They also resemble the stones found in 1870 in the Rue Monge belonging to another amphitheatre, a portion of which was restored some years ago and converted into a public garden.

In her third lecture at the Passmore Edwards Settlement, on Delphi, Miss Harrison dealt with the omphalos or navel-stone, the most sacred of all the objects at Delphi—what it was, where it stood, and what it signified. From references to the famous opening scenes in the *Eumenides* of Æschylus and the *Ion* of Euripides it was clear that the tragedians believed the omphalos to be within the temple, and close to the tripod, and from the narrative of Pausanias we should conclude it stood outside the temple at the east end, and near the great altar. At this very point a large filleted omphalos had been discovered by the French excavators, and this, it was highly probable, if not absolutely certain, was the omphalos seen by Pausanias. There seemed little doubt that the sacred stone was moved some time between the fifth century B.C. and the visit of Pausanias. The French had also found in the treasury of the Athenians a conical white marble stone, which seemed to correspond with the stone noted by Pausanias as the stone swallowed by Kronos. This stone used to be anointed with oil, like the Bethel of Jacob, and covered with wool on feast days. A number of representations of the omphalos on vases, reliefs, and coins were shown, and the general conclusion arrived at was that the omphalos was an

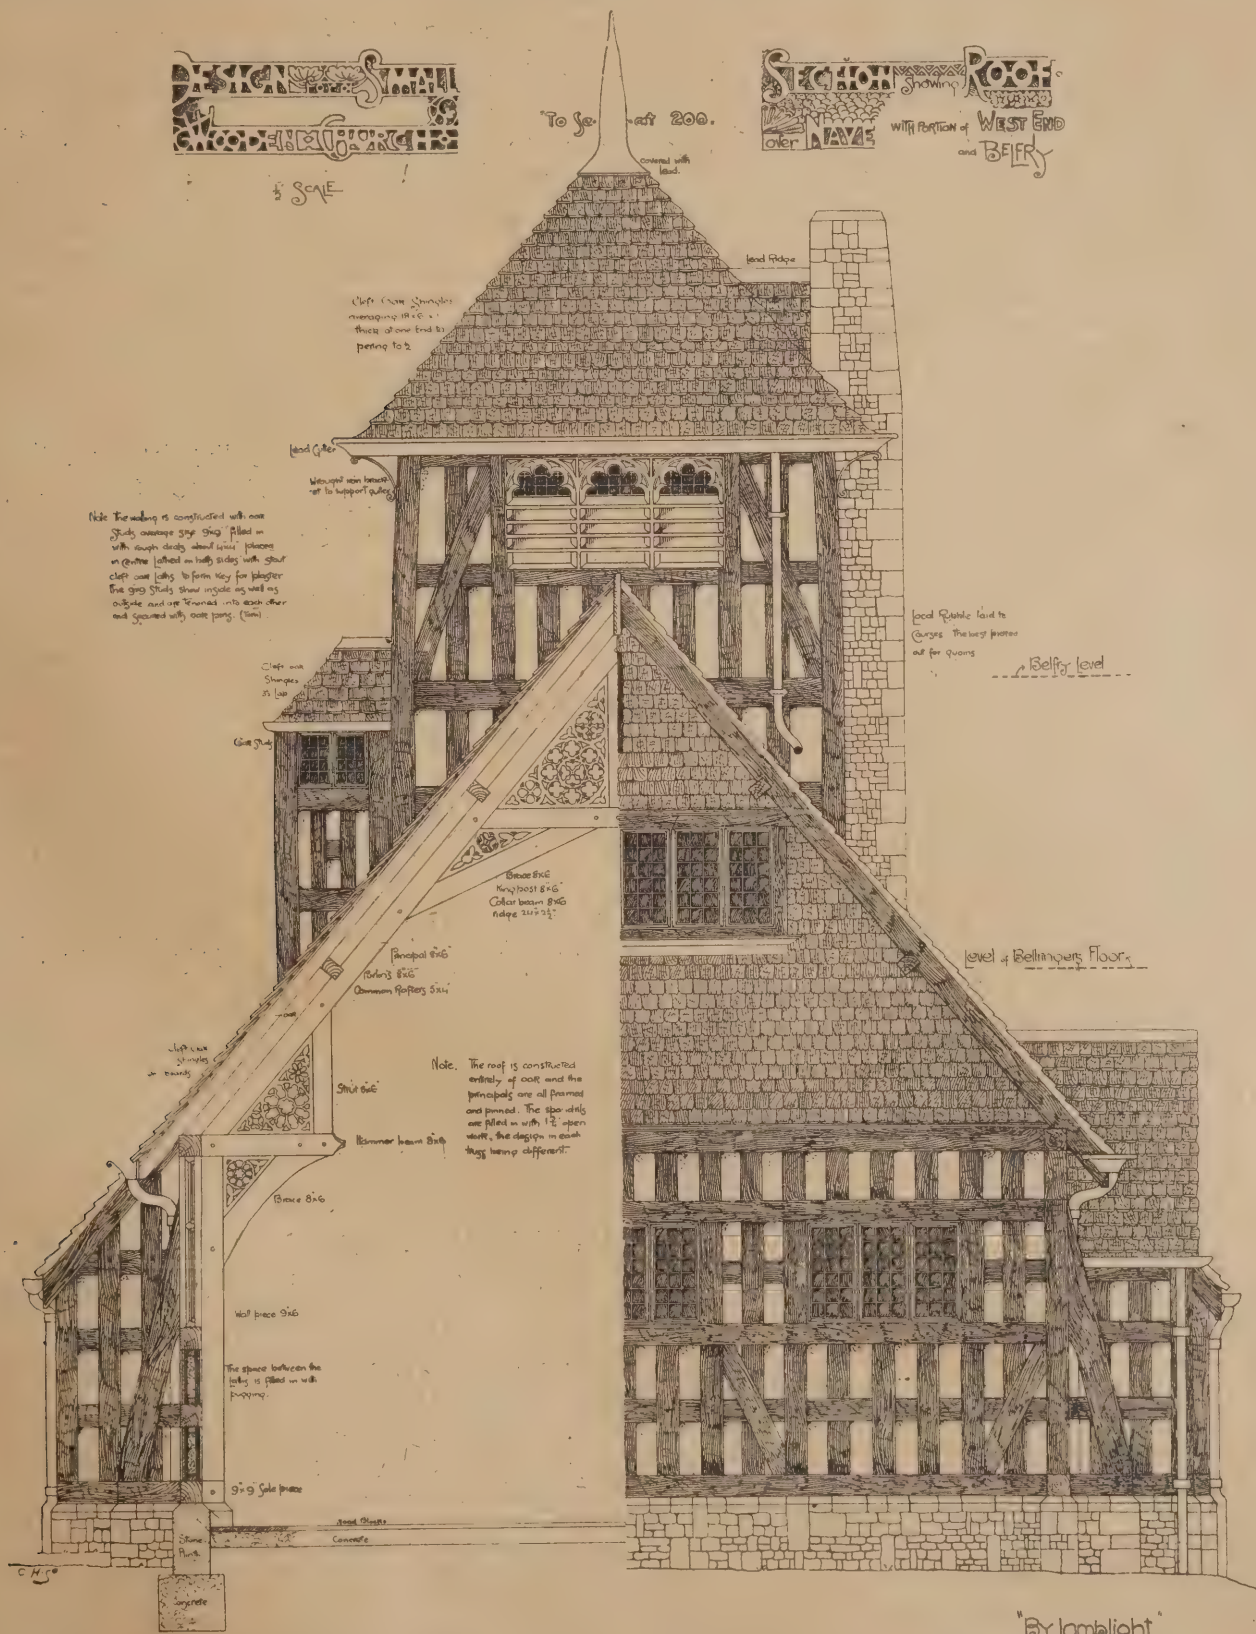

oracular fetish stone connected with the worship of Gaia, the earth Goddess, and long antecedent to the coming of Apollo.

In order to have the benefit of experience gained on the Continent and in America regarding questions of fire prevention, the executive of the British Fire Prevention Committee has invited a number of gentlemen to become honorary corresponding members; they have promised to afford every assistance in keeping the Committee informed of matters of importance relating to its work. Among these corresponding members are the Director of Public Works to the Prussian Government (Herr Hinckeldeyn), the Chief Engineer of the

City of Hamburg (Herr Andreas Meyer), the Architects-in-Chief of Vienna, St. Petersburg, and Cologne (Messrs. Berger, Luzor, and Stuebben), and, further, Chief Officer Meier, of Amsterdam, and Messrs. Gerhard and Constable, of New York. Messrs. Andreas Meyer and Constable, it will be remembered, had charge of the important fireproofing tests which were made respectively at Hamburg and New York, whilst Chief Officer Meier organised the first scientific fire congress held in Europe.

THE London County Council, at its final meeting last week, considered a report by the Housing of the Working Classes Committee containing particulars of a block of dwellings

which it is proposed to erect on the site of the Boundary Street area. Wargrave Buildings, as the block will be called, provides accommodation for 280 persons in sixty associated tenements, of which twenty contain three rooms, and forty two rooms. The architect's estimate of the cost of the buildings is £13,715 10s., and the committee asked the Council to approve of the scheme, and to instruct that the work be executed without the intervention of contractor.—Mr. White moved that the recommendation be referred back with instructions to the committee to invite tenders for the work.—Lord Dunraven seconded the amendment, which was defeated by 50 to 45 votes, and the committee's recommendation adopted.

MR. G. A. T. MIDDLETON has now made known full details of his sketching tour to the Hartz district, to which we referred last week. Intending tourists will note with satisfaction that the Great Eastern route has been adopted, as through trains in connection with the Harwich steamers are run both from York and Manchester as well as from London, thus enabling students from these further parts of England to participate with the minimum of trouble. Tickets will be available from any Great Eastern station—that is, from March by these through trains—and the travelling throughout will be second class on rail and first class on the steamer; while the hotel accommodation will be the best procurable. In the smaller and most interesting towns this will be probably of a homely rather than an ostentatious character, but in Hanover and Brunswick the accommodation will be at least as good as in towns of equal size in England.

A MEETING of the committee engaged upon the restoration of the Collegiate Church of Stratford-on-Avon was held recently. Mr. Bodley, the architect, attended to confer with the committee respecting the recently-discovered Early English lancet window, which was found when piercing the west wall of the south transept, a relic that had been hidden for nearly six hundred years. Mr. Bodley gave it as his opinion that no great sin would be committed in making the required opening in the wall, and thus doing away with the window, which was considerably mutilated. It was also thought undesirable to interfere with the plans of Messrs. Hill, who required the space for the reconstruction of the organ. The committee approved the recommendation of the architect that the new oak benches should be placed in the north and south aisles, and that the whole of the nave should be seated with chairs. It had already been decided that oak blocks should be used in place of deal for the flooring, being more in character with the church, and the hope was expressed that a donor would be found to provide new choir stalls, the cost of which was between £300 and £400.

IMPORTANT changes are, it is stated, likely to take place before long in the surveying branch of the Department of Works and Public Buildings. Sir John Taylor, who has been chief surveyor for many years, contemplates retirement from his office in the course of the next few months, and it is expected that he will be succeeded by Mr. Tanner, one of the younger surveyors. But it is believed that, although Sir John Taylor gives up the onerous and responsible office in which he has long served the Crown to the entire satisfaction of successive First Commissioners, his services will not be completely lost to the Department. It is understood that he will superintend the erection of the new War Office on what is known as the Carrington House site in Whitehall. He has had much to do with the preparation of the plans for that building, and it would be manifestly convenient for him to see them carried out. As the houses now occupied by the Office of Works in Whitehall Place will be pulled down in connection with the War Office scheme, the First Commissioner and his staff will remove to Storey's Gate in the course of the ensuing summer. It may also be remembered that Sir John has under his direction the restoration of the State apartments at Kensington Palace, which are shortly to be thrown open to the public.

THE Parliamentary Committee of the County Council reported, at the last meeting, that they were taking steps with regard to the preparation of the petition against the Westminster Improvement Scheme; but it appeared to them the Bill opened up considerations of such magnitude that the Council should not confine itself to simply opposing it in committee. They pointed out that the essentially important point for the consideration of the Council was whether or not it was desirable that the large powers sought, and the execution of such considerable works should be entrusted to a private company. The Bill would, of course, only be promoted in the

expectation of its proving remunerative to the promoters. Parliamentary precedent was against such a proposal, and there was, moreover, no guarantee, even assuming that the scheme was started, that any portion of it might not be abandoned after other portions had been wholly or partially carried out, or after a large number of buildings had been demolished. It was proposed by clause 19 that the compulsory powers might be put into operation so soon as a sum not less than £250,000, part of the capital, should be subscribed, under contract binding the parties thereto to the payment of the several sums respectively subscribed by them. Clearly it was necessary to guard against the possibility of the scheme being commenced without adequate security for its being ultimately carried into effect; otherwise the promoters might find themselves in difficulties, the undertaking might pass into a derelict condition, and it might become necessary for the Council to intervene at the cost of the ratepayers. They did not think that a scheme of this kind, involving large works of a public character, and large compulsory purchase of property, should be promoted as a private undertaking. Accordingly, they asked the Council to be allowed to take steps to obtain the rejection of the bill on second reading.—The Council confirmed the report.

THE Khedive in Council has approved a contract just concluded with Messrs. John Aird and Company for the construction of the long-talked-of Nile reservoirs. The work, which consists of a dam across the Nile at Assuan and another at Assiut, is to be completed in five years, and the contractors accept payment by annual instalments of £160,000 sterling, extending over thirty years, and beginning on the completion of the dams. The great dam forming the reservoir at Assuan will be constructed upon the granite reefs of the cataract, and will be composed entirely of granite ashlar, solid in section and pierced with sufficient openings to permit of the passage of the Nile in flood, with a very moderate heading-up. In the autumn months, after the silt-laden water has passed off, the sluice-gates will gradually be closed until the reservoir is full, which, in an ordinary year, will be in January or February. From April to the end of August, when the river runs low, the gates will gradually be opened, and the supply in the river will be supplemented by the water stored in the reservoir. By the time the reservoir is emptied, the new flood water will have arrived. Thus no break will occur in the irrigation system. The dam will be some 76ft. above the river bed at its lowest point, and the difference in the level or head of the water will be about 46ft. Its approximate length will be about 6000ft., and the amount of water to be stored is calculated at 1,065,000,000 cubic metres. Locks will be constructed capable of passing Nile steamers through the cataract. The Assiut dam is intended for raising the river level during the summer, thus increasing the distributing power of the canals in Middle Egypt and the Fayum, and it is designed much upon the lines of the great barrage north of Cairo.

A PROPOSAL to extend the Walker Art Gallery, Liverpool, is now occupying the attention of the Corporate Committee controlling that institution. In order that the pictures in the permanent collection may be hung to the best advantage, considerable additional space was no doubt required, and a new set of plans of the suggested work will be presented to the members of the Gallery Committee.

SOME important military works have been decided upon at Dover, and are to be commenced immediately. These include the erection of a block of new barracks to the east of Dover Castle, for which a contract has been settled at nearly £8000, and the construction of three modern forts on the cliffs. It is stated that the whole of the work is to be completed within about twelve months. The forts will be on the heights on either side of the town, so as to command the Channel and

cover the Admiralty National Harbour. is to be constructed to the east of Dover far from the convict prison. To the west the town two forts will be constructed, near Shakespeare Cliff.

MR. JAMES SAUNDERS, Associate of the Royal Institute of British Architects, Graduate of the Incorporated Association of Municipal and County Engineers, Associate of the Chester Society of Architects, and who is Assistant Borough Surveyor at Oldham, been elected City Surveyor and Water Engineer of Chichester.

CONSIDERABLE interest attaches to the one which is now being made to preserve on the most interesting memorials of Puritanism in suburban London by the purchase of Richard Baxter's old house at Acton. The house is just opposite the parish church, and is announced to be sold in order to clear way for building operations. It is suggested that such an interesting relic of Puritanism should not be swallowed up by the modern builder, but that it should be preserved.

AT Asti, in California, there is a reservoir 104ft. long, 34ft. wide, and 24ft. deep, which is kept full of wine. First an excavation was made in the rocky hillside. Next a wall of concrete 2ft. in thickness was put in the bottom and sides. Then came the laying and glazing of the cement. All around the sides big girders were put in place, and on these the sectional cover of the lake. This is constructed that not a ray of light can penetrate into the vast quantity of wine.

DURING excavations in Parliament Street, Nottingham, in connection with certain public works, a discovery of considerable archaeological interest was made. In the course of their operations between Market Street and Queen Street the workmen came across remains of the old town wall. It is supposed that the wall was constructed at least 800 years ago, being built of rock, in connection with which clay was used. It varied in width from 9ft. to 12ft., as far as recent observations throw light upon the matter. Starting from the Castle it ran, by way of the Postern Gate, to Park Row, ultimately crossing Chapel Bar in Upper Parliament Street, whence it proceeded in an oblique direction. Fragments were discovered some years ago opposite the site attached to the Black Bull Inn. Proceeding by way of that which is now Market Street, a point about 14ft. distant from the Monument statue, its course was then towards the site of the buildings which, until recent years, stood in the centre of Lower Parliament Street thence towards Coalpit Lane and the Market. As far as accepted theories are to be considered, the circuit was completed in the house Yard, the wall ending near the Coal Rock. During the recent works in connection with the Great Northern Company's participation in the Great Central Company's scheme some interesting remains of the wall were found.

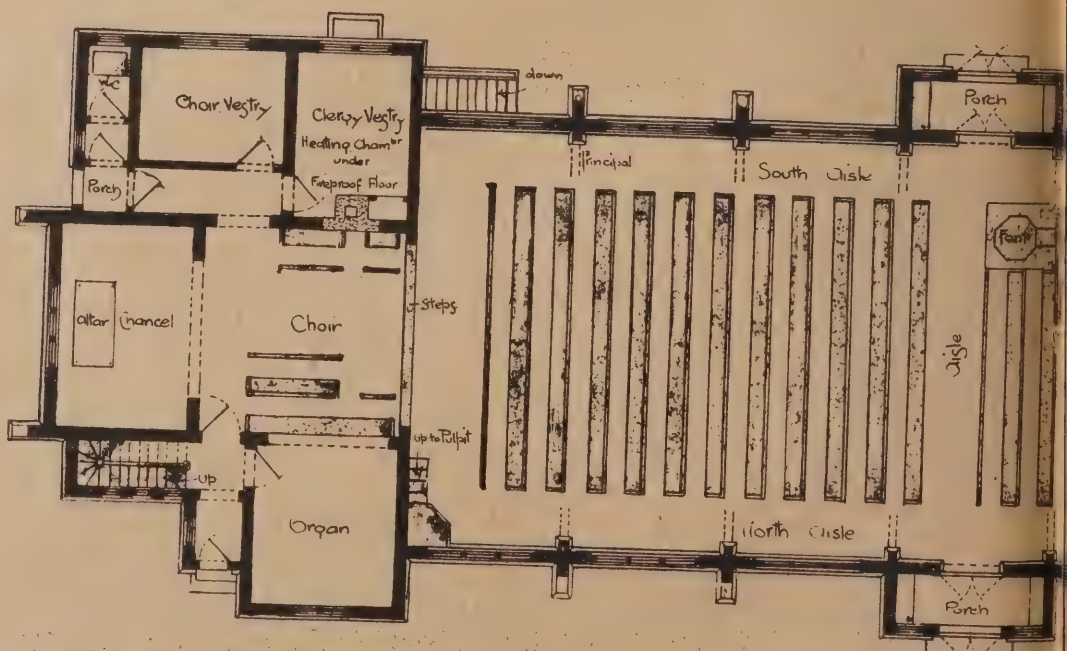

A NEW parish house has been erected in Clare Market in connection with the Church of St. Clement Danes, Strand. The building has been erected upon a piece of ground known as "the island," the gift of Mr. W. F. D. Smith, M.P., at a cost of about £4000, exclusive of the site, which is valued at about £3000. It contains a large hall, with seating accommodation for about 250 persons, and four other rooms.

In considering the half-yearly estimates, the Public Works Committee of the Cardiff Corporation discussed the merits of macadam stone paving, or wood paving. The Borough Engineer stated that if the streets were paved with wood there would be a very large saving not only in the repairing, but in the scavenging. — Councillor Crossman said that in his opinion the macadam system was not good enough to bear the heavy traffic in the town and supported the Borough Engineer's idea of paving with wood blocks or something else that would wear better.

MASONRY.

By JAMES WILDING

(Lecturer at the Liverpool School of Science, Technology, and Art).

No. I.

THE examples dealt with represent simple developments often required in the ordinary course of a mason's occupation. To make the principles embodied as clear as possible the minimum number of lines consistent with full explanation are used in each case.

FIG. 1.—THE CANT MOULD.—The square section of a mould is the one usually supplied by the architect to the workman—from this the developed section is obtained. The use of this mould is to prevent unnecessary labour on surfaces that are ultimately cut away.

The square section is marked inside an oblong figure. A C is the angle of the side for which the mould is required. Draw A M at right angles to A C; with A as centre describe the arc 1 M; divide the line 1 A into any number of parts—in this case, twelve—with A as centre. Describe the arcs dividing the line A M into the same number of parts; lines 1 2 3 4 5 6 7 8 9 10 11 and 12 are drawn parallel to A F B; from the points where touch the curve of the square section they are then drawn parallel to A 1 until they touch the line A C; from the points of contact on A E C draw them parallel to A M. Through the points of intersection the mould required for the "cant" is drawn.

This principle may be applied to any angle, care being taken to follow the method here described step by step.

FIG. 2.—DEVELOPMENT OF MOULD FOR LEVEL BED IN ARCH.—The square section is marked at the springing line. This is divided into a number of parts on the face, viz., 1 2 3 4 5 6 7 8, and on the soffit A B C D E F G, these being drawn parallel to the face line from the points of contact made by the lines 1 2 3 4 5 6 7 8 with line of the square section. Lines 1 2 3 4 5 6 7 8 are drawn parallel to the curve of the arch to touch the level line R S; transfer the numbers 1 2 3 4 5 6 7 8 to the

FIG. 1. THE "CANT" MOULD.

level line R S. As the width of the arch does not vary, the lettered divisions may be transferred by measurement. The mould traced through the lines that are square to R S and

FIG. 2. DEVELOPMENT OF MOULD FOR LEVEL BED AND ARCH.

those parallel to it will be the required section.

This principle can be applied to any line representing any level bed—say, for instance, any level bed required in a groin springer. A very simple mould is here used—the most complicated can be almost as easily developed.

FIG. 3.—RAKING MOULD FOR PEDIMENT.—An ordinary cyma-recta or ogee mould is here developed from the level to the raking line. The object of this development is to obtain a mould that will work or "mitre" with the level section. It will be seen from examination of the figure that the projection is divided into five parts on the line squared from C E; these are dropped vertically to touch the curve of the square section. The centre C is used for convenience. With C as centre, turn over from left to right the numbers 5 to 1; from C L draw these lines square to the rake; from the points of contact, the lines 1 to 5, make with the square or level section; draw lines parallel to the rake; through the points of intersection draw the curve L 1 2 3 4 5 E. This is the developed section, and will mitre with A F.

FIG. 4.—RAKING MOULD FOR SEGMENTAL PEDIMENT.—This is very similar to the example described in the preceding case. Square A M from A K, and divide into parts illustrated in the figure; square A R from A G; with

centre A, turn over from left to right divisions 1 to 5; drop these vertically to touch the level section. From the centre G, draw these to touch A G; square them out from A G. Now drop the divisions on A R, and through the points of intersection the developed mould is traced.

FIG. 5.—MOULD FOR LEVEL BED IN A STEEP GABLE.—In some very steep gables it becomes necessary to use the level bed in order to allow the coping to rest rather than thrust the footable. This figure represents such a case. The square section is marked inside a square figure—the level line M C is drawn—square M N and C R from M C—with C as centre describe the arcs indicated in figure—it will be seen that the arcs indicate points that divide the mould into parts, and give points of contact in the square section through which lines parallel to the rake may be drawn from the points where these last touch the level line M C, they are squared down from the said level line—draw the lines indicated by the arcs parallel to M C, and trace the section through the intersection—this gives the required mould. In order to avoid the feather edge at M, the top member is sometimes left square from the rake—the lower members only being developed.

A LOCAL Government Board inquiry has been held at Nottingham into the application of the Corporation for a provisional order to empower them to put in force the powers of the Lands Clauses Acts with respect to the purchase and taking of lands required by them for the purpose of sewage disposal. Mr. Arthur Browne, M.Inst. C.E., city engineer of Nottingham, said 638 acres of land was not nearly sufficient for the present purpose, and it would be totally impossible to deal with the additional sewage unless they had additional land. The sewage farm would be a failure if they tried to do it. The area of land which he thought should be taken was that which appeared on the deposited plan, and that would be an additional 987 acres, and would make a total area of 1890 acres. About 500 acres of that it was impossible to deal with, leaving about 1300 acres available for their purpose. Of that they had sacrificed 113 acres in accordance with the wishes of the County Council. If they sacrificed that land there could not be any reasonable complaint by anybody.

FIG. 4. THE RAKING MOULD FOR SEDIMENTAL PEDIMENT.

DILAPIDATIONS.*

By PROF. HENRY BUSHELL, F.S.I.

(Continued from Vol. VI., page xlvii.)

I BELIEVE I am right in stating that the London County Council take out about 1500 summonses in a year, the major portion of which are addressed to owners of property in respect of dangerous structures. But this somewhat wholesale summary method of procedure received a salutary check on the 2nd of last November by a decision of a Divisional Court, consisting of Justices Wright and Kennedy, The County Council, as well as their predecessors, the Metropolitan Board of Works, used to take no trouble or steps to ascertain who was the responsible party, but simply served on, or affixed to, the premises, a notice addressed to "The Owner," and then forthwith proceeded to get, almost as a matter of course, a magistrate's order against that more or less indefinite party, whomsoever he might happen to be. But recently the magistrate, Mr. Mead, declined to be so complaisant, and refused to make the order asked for by this powerful authority when the summons had merely been affixed to the premises. He held that this was not proper service, and that the Council ought to have exercised reasonable diligence to ascertain the actual owner, and have given evidence of such diligence before they were allowed to act in this summary manner. The County Council appealed against the magistrate's view (*Regina v. Mead*, Times Law Reports, Vol. xiv., p. 14), and, as before stated, had again to put up with defeat. It is to be hoped that in future they will seriously make inquiries beforehand in the direction indicated by the decision, and thus, perchance, diminish in some measure the harassing of lessees. This matter is of such grave importance that I trust you

* A paper entitled "The Practical Application of the Principles and Law of Dilapidations," read before the Auctioneers' Institute.

FIG. 5. DEVELOPED BED MOULD FOR LEVEL LINE IN STEEP GABLE.

will allow me to remind you of the case of *Lister v. Lane and Nesham*, quoted in my previous paper. The lessors claimed £700 for rebuilding a house which had been

CONDEMNED AS A DANGEROUS STRUCTURE, and pulled down by order of the district surveyor. The original construction was proved to be faulty, and the Court of Appeal held that the lessees were not liable under the covenant to substantially repair, uphold, maintain, &c. It is now generally accepted by the Courts that a vital principle in considering dilapidations is the condition and character of the premises at commencement of term. This evidently must exercise the judgment of the surveyor when determining whether or not such glaring defects as possibly are the advanced stage of inferior building are legally dilapidations. "Dry-rot" may be admitted to be closely allied to the foregoing. It is usually produced by faulty construction or want of ventilation. There is a difference of opinion among surveyors as to the liability to repair the consequences of "dry-rot." I incline to the view that the lessee must be liable, as under a repairing covenant he must repair from time to time. And although he may not permanently get rid of the trouble, yet, short of improving the construction (of a basement, for example), he must, unfortunately, accept the responsibility. We must not overlook the fact that dry-rot is sometimes brought about by a tenant's neglect.

POINTING TO BRICKWORK

affords another useful example for controversy. It must be admitted that pointing fulfils a necessary, as well as an ornamental purpose. I fail to see how any qualified surveyor could dispute the claim, as a dilapidation, if the mortar had so far worn or crumbled away as to admit the weather or wet into the walls. They must suffer in consequence, and the premises be, to some extent, the worse. In fact, I go further, and say, if "bare or open" joints are neglected long enough, the result will be a serious dilapidation. The kind of pointing claimable is quite another matter, and will be governed by the circumstances, but a weathered joint is a good form. Cement fronts and stucco work often offer a striking example of dilapidations. In recently surveying a town house in the West End, for the lessor, I found that the whole of the work of this description (some of it of elaborate design) was in a terribly dilapidated condition; in fact, the worst case of the kind in a house of its pretensions that I had ever seen. A heavy claim was the result. In certain cases of this nature I am not so sure that the mere reinstatement of the exterior would be sufficient to compensate for the inevitable injury to the fabric. As to

THE QUESTION OF RENT CLAIMS,

I am of opinion that, under certain circumstances, a claim in respect of rent as compensation during the execution of repairs is reasonable. The case just cited afforded an example of where a claim for a quarter's rent (£75) was made and recovered, but it is only right to say that the dilapidations recovered amounted to nearly £700, and as the lessee did nothing in the matter, and vacated on the last day of the term, there was, of necessity, time lost during the execution of repairs. Sanitary matters, including drainage, continue to call for careful discernment on the part of the surveyor. It is not altogether easy to state the present position of the law thereon concerning liabilities to repair, &c., but it appears almost settled law that a lessee under a full repairing covenant would have to be wholly responsible for drainage and sanitary matters not chargeable to the local authority of the *locus in quo*. It would, however, be advisable for a lessee to ascertain before taking an unfurnished house on lease if the drainage was not approved, or was such as is likely to be condemned. Incidental to these matters the important question arises as to the

DISTINCTION BETWEEN A DRAIN AND A SEWER.

The case of *Travis (appellant) and Utley (respondent)*, decided in 1893, is a case in point. A drain running under the basements

of three adjoining houses and carrying the refuse matter of all three houses into a public sewer, was held to be a sewer within Section 4 of the Public Health Act, 1875, and vests in the local sanitary authority. The appeal was heard before Justices Wills and Wright, and this interpretation was confirmed. But it is easy to conceive cases where the surrounding circumstances will render the distinction and interpretation by no means easy of application. Where Part III. of the Public Health Act, 1890, has been adopted by a sanitary authority, a drain passing through private ground, but receiving the drainage of more than one house, is a drain within the meaning of Section 19 of this Act, and is not a sewer within the meaning of the Public Health Act, 1875. This case was that of *Self v. Hove Commissioners*, and was an appeal from the County Court of Sussex, heard in 1895 before Justices Wills and Wright. It was held that this case was distinguishable from *Travis v. Utley*, and on appeal the decision of the County Court judge was reversed. The Local Board issued notices on plaintiff

TO RECTIFY A NUISANCE,

whereupon the plaintiff employed a contractor to do the work, and sued the defendants for the costs, and recovered in the County Court. On appeal it was held that the real liability was on the plaintiff, and not on the defendant. The more recent case of a similar nature to the last is that of *Eastbourne (Mayor) v. Bradford*, heard on appeal before the Lord Chief Justice and Mr. Justice Wills, in 1896. The appeal decided that a local sanitary authority who had adopted Part III. of the Public Health Acts Amendment Act, 1890, may, upon the true construction of Section 19, treat a drain connecting two or more houses, the property of different owners, with a public sewer, as

A SINGLE PRIVATE DRAIN

and repairable by such owners individually. It was an appeal by the defendant against judgment for the plaintiffs, a local sanitary authority, in an action brought in a County Court to recover in a summary manner, under Section 41 of the Public Health Act, 1875, as amended by Section 19 of the Public Health Acts Amendment Act, 1890, a proportion of expenses incurred in relaying a drain which connected the defendant's house, as well as the houses of the owners, with a public sewer. The appeal was dismissed, and the decision referred to above was upheld. Innumerable cases could be quoted bearing directly upon the subject under consideration. I have, however, in the foregoing, endeavoured to submit some of the more important cases decided in recent years. These may, I think, be safely regarded as acknowledged precedents, and as they decide some of the most "vexed and litigious points in dilapidations," a knowledge of the cases is invaluable to the surveyor.

It is estimated that £9000 will be required to make good the damage to the South Pier at the mouth of the Tyne. Mr. Walker, the Commissioner's engineer, has been instructed to go on with the work of replacing the disturbed foreshore blocks and adding a toe to protect these blocks. The sum of £9000 estimated to be required for this work has already been provided for in the estimates in three sums of £3000 each; and Mr. Matthews, of the firm of Messrs. Coode, Son, and Matthews, is making an examination of the condition of the South Pier. As to the North Pier, the walls on both sides of the parapet to the west of the breach have long shown signs of weakness—caused through the employment of lias lime, used in cementing the masonry blocks, this material having proved unsuitable through its inability to resist the action of the salt water and the weather—and now Mr. Matthews recommends the Commissioners to take immediate measures to save these parapet walls from falling away outwards by strengthening the pier at the parapet with tie rods passing from the outside of each parapet wall through the middle of the structure. This is found to be necessary for a length of 600ft.; and three tie rods will be inserted in every 50ft. of this section.

Surveying and Sanitary Notes.

THE Barry District Council has decided to ask the Local Government Board to sanction the borrowing of £9450 for new works in connection with the water supply of the town, instead of £7950, as originally intended. The water engineer (Mr. E. W. Waite) reports that it is intended to construct a new reservoir at high level with a capacity for 280,000 gallons.

THE foundation-stone has been laid of the Sheffield pumping station works, in connection with the Walsall Wood sewerage scheme. The cost of the engineering works is about £11,700. The sewage farm is at Clayhanger, a distance of two miles away, and is already in use for the Brownhills district. Mr. H. B. Nichol, of Birmingham, is the engineer for the scheme, and the contractor is Mr. H. Holloway, of Wolverhampton.

THE offer of Messrs. D. Cunningham and Son, Kilmacolm, to carry through the Parkhill Reservoir improvement scheme, has been accepted by the Glasgow Town Council. The additional tank to be constructed will contain about 500,000 gallons of water ready for use, and the filterage accommodation, which has been found to be inadequate for some time, will be considerably increased, the committee having decided to add two new filters in connection with the reservoir. The contract price is about £4000.

THE Royal Agricultural Society, a few weeks back, approached the Local Government Board on the subject of the regulations imposed by certain local authorities, fixing a minimum cubic air-space for cow-sheds. One point was made clear, viz., that the central authority had not imposed any uniform regulations, although it had in certain cases approved regulations submitted to it. But it also

appeared that the Local Government Board contemplate drawing up regulations, in which a minimum air-space will be fixed.

COLONEL A. J. HEPPER has held an inquiry on behalf of the Local Government Board into the application by the Batley Corporation for sanction to borrow £13,494 for works of surface water drainage. The Town Clerk (Mr. J. H. Craik) appeared in support of the application, and said that at present the surface and storm water went into the ordinary sewers, and in times of heavy rainfall these were insufficient. Serious complaints had been made of cellars being flooded, and when the surface water drains were laid the cause for complaint would be removed.

THE Local Government Board has issued, as a supplement to the Department's twenty-fourth annual report, a summary of the general sanitary survey of urban districts in England and Wales during the years 1893-95, when cholera on the Continent of Europe was an ever-recurring source of danger to this country. The survey took account of a large number of rural as well as of urban districts; but, owing to the delay caused by a serious accident which befel Dr. F. W. Webster, to whom the supervision of the survey was entrusted, and to the subsequent death of Dr. Barry as the result of his accident, the summary relates almost exclusively to the work done by the Department's medical inspectors in urban sanitary districts. Sir Richard T. Thorne, medical officer of the Department, states in an introductory note that the volume indicates the directions in which English sanitary administration proceeds when danger of imported infection arises; and it serves to emphasise the point that our main trust in the control of exotic disease lies, not in futile attempts to keep away from our shores all chance of infection, but in urging those who are responsible for the health of our communities, whether urban or rural, to maintain, by continuous and systematic work, such a standard of cleanliness as regards air, soil, and water, that their districts shall not afford

to any chance infection that may reach them the opportunities for multiplication and diffusion. In an unfinished introduction, the late Dr. Barry mentioned that reports were made during the survey regarding 396 districts, and added: "As to the value of the sanitary survey, there can, I think, be no two opinions, and it is only to be regretted that owing to the exigencies of the public service it could not be continued for a longer period."

SATISFACTORY progress has been made with the Burntisland new dock works, which were commenced about nine months ago. The new dock is to have a water area of fully ten acres, and a maximum depth at spring tides of 29ft. In order to obtain this extra depth the new works are being constructed to the south and east of the existing dock, and that necessitates the reclamation from the sea of an area of about thirty acres. During the past months the reclamation wall, which runs in a westerly direction from the eastern boundary at the Lammerlaws promontory, has been run out to the extent of 680 yards. The whole of the material used in the construction of this embankment has been obtained from a field of hard whinstone rock adjoining the shore, and about 80,000 cubic feet of this rock have been obtained by blasting operations. About 200 yards of the reclaiming wall have still to be constructed, and when that has been done an additional length of 500ft. will be built of concrete in order to protect and strengthen the new dock head. At the west side of the harbour an extension, and what is known as Cromwell Pier, has almost been completed, the distance run out being 500ft. The round head at the point of that pier has yet to be constructed, and between the piling work a solid concrete wall is to be erected, five blocks of which have already been built. This wall is 26ft. broad at the base, and 12ft. at the top, and is to be surmounted by a 6ft. screen wall to protect the new entrance from the force of westerly gales and seas. The width of the new dock entrance between the pier heads will be about 250ft.

EGYPT, THE BIRTHPLACE OF ARCHITECTURE.*

BY G. A. T. MIDDLETON, A.R.I.B.A.

EGYPT is, as far as has been ascertained, the fountain-head of all civilised Architecture, and being a country of peculiar climate, the remains of even the most ancient works have been handed down to us in a remarkable state of preservation, so that we are able to trace their history back in a manner which would have been otherwise impossible. Besides this, again, the monuments have been covered with inscriptions, both by those who erected them and by their successors, and modern research having enabled these inscriptions to be read, the history of the country and of the buildings alike has been revealed.

So far as it has been possible to ascertain the facts, it appears that the generality of the people have been at all times agriculturists, subject to despotic and often foreign rulers, who have made them their slaves. Thus, whenever the throne has been occupied by those who have been inclined to build, there has been ample slave labour available, both for the actual erection of the buildings and for the transport of materials, to bring limestone from the hills bounding the Nile valley, or granite from Syene.

The dates given by various authorities both to buildings and rulers are very confusing, but, according to Mariette, there were thirty different Dynasties of heathen Kings, or Pharaohs, between the years 5004 B.C. and 378 B.C., divided into three great periods, thus:—

1st Period	Thinite and Memphite.	1st to 10th Dynasties.
2nd Period	Theban (Ancient)	12th to 17th Dynasties.
	2466 B.C. to 1702 B.C.	
3rd Period	Theban (New).	18th to 21st Dynasties.
	1702 B.C. to 966 B.C.	
	Saite (Old)	22nd to 26th Dynasties.
	966 B.C. to 527 B.C.	
	Saite (New)	27th to 30th Dynasties.
	527 B.C. to 378 B.C.	

Then, after a short gap, came the period of Grecian rule, under the Ptolemies, commencing 322 B.C., the first Ptolemy having been a general under Alexander the Great; and this

* A paper read before the Society of Architects on Thursday, February 24th, 1898.

COURTYARD DENDERAH.

is followed by Roman occupation in the year 30 B.C., Egypt subsequently, for a long time, forming part of the Byzantine Empire, as it has remained feudatory to Constantinople even to the present day.

The building epochs also arrange themselves into four great groups, marked, as might be expected, by great divergences of style, which may be arranged as follows:—

- I. Pyramidal or Memphite, during the 4th Dynasty.
- II. Proto-Doric or Early Theban, during the 12th Dynasty.
- III. Theban or Late Theban, during the 18th and 19th Dynasties.
- IV. Ptolemaic, during the times of the Ptolemies and the Romans.

Between these periods the throne seems to have been occupied by kings who devoted themselves to other Arts than that of Architecture, or the country appears to have been in a state of disorder, as during the rule of the

Hyksos, of which little is known, between the 12th and the 18th Dynasties.

The earliest buildings existing are all of the nature of tombs. It seems that the Egyptians, with some vague idea of the Resurrection such as has been possessed by many heathen races, had a belief that the body would come to life a second time some three thousand years after death, if properly preserved. Hence the mummies, and the solid tombs. These latter first took the form of square-based Pyramids—evident successors to simple tumuli or heaps of stones; and the earliest of these of which remains exist is the Great Step Pyramid at Sakkarah. Accepting the earlier dates in all cases with caution, its erection is generally ascribed to Ata, King of Egypt, about 4300 B.C. Besides this, all that is known of it is that it consists of six huge steps of limestone masonry, arranged one upon another until a rough pyramidal form is attained, the steps being respectively 38ft., 36ft., 34ft., 32ft., 31ft., and 29ft. high.

If there were any intermediate stages between this and the perfect Pyramid, they have been lost, but of these latter there are many examples the principal group being at Gizeh, near Cairo, and the principal one of the group being the famous Great Pyramid of Cheops (or Khufis), which is supposed to have been erected about B.C. 3733. Each side of its base measured about 760ft., and its vertical height 450ft.; but its actual dimensions are difficult to determine, as the original granite casing has all been removed, and only the limestone core remains. The granite casing is said to have been so perfectly worked that not even a thin piece of paper could be passed into the joints; and this is still the case with the granite lining to the passages with which it is traversed, and which penetrate even into the rock upon which it is built. How the blocks could have been worked so perfectly, and how raised into position when worked, still remain unsolved problems to the present day.

The fact of the tomb chamber having been found unoccupied when explored has caused the promulgation of many theories as to the reason for the existence of the Pyramid at all, one of an exceedingly fanciful nature being that it was a prophetic building erected by Melchisedech, and another, put forward by a well-known astronomer, being that its passages, and the grooves along their sides, were intended to perform the office of huge telescopes for the observation of certain stars at certain times.

If the remains of the Pyramidal epoch be few, even though colossal in size, those of the

PYLONS, EDFOU.

succeeding period, the Proto-Doric, are fewer still, and small withal; but they make up for this by foreshadowment of greater things to come elsewhere in later ages. Some half-dozen dwellings were excavated during the 12th Dynasty, and about the year 2300 B.C., in the limestone escarpment bordering the Nile Valley at Beni Hassan, these being subsequently used as tombs upon the death of their inhabitants. The arrangement was that of a single chamber with the roof supported by columns, not built up, but simply left out of the solid rock when the chamber was excavated. In the principal case there is also a smaller chamber within, evidently used as the tomb; and in that, as in most instances, a verandah was formed in front of the entrance by carrying the overhanging rock there also by columns. The arrangement is precisely that which might be expected in a small flat roofed timber house in a hot country, from which the inspiration is most evidently taken; as is seen at once by examination of the front of the verandah, for the columns have small abaci, representing bearing-pieces of wood, between their tops and the lintel which they carry. This lintel is in the form of a horizontal architrave or beam of wood, and above it are representations of the ends of longitudinal rafters such as would carry the flat roof; while large flat circular discs are employed as bases, again, like the abaci, to act as bearing-pieces, this time to distribute the weight of the columns over the surrounding surface. In reality, however, the parts are not pieced together as the above description might lead one to suppose, but the whole is left of solid rock, without joint.

A great deal has been made both of this plan and of this elevational arrangement, as being the prototype of not only its immediate successors, the Egyptian Temples of later Dynasties, but of the Grecian Doric order. The plan of a prostyle temple consisting of a simple cell, with side walls extended in front, and columns placed there so as to form a verandah or entrance, is here clearly enough; but whether the temple plan was derived direct from these tombs, or from the type of building from which these tombs were also derived, and which must have been in common use for several hundreds of years, is questionable. So, too, it is with the general features of the elevation—and, perhaps, it is more interesting to believe that these tombs merely represent in stone a type of building, common for a long period of time, proving it to have been of exceedingly ancient origin, than to imagine that the inspiration of the Grecian temples was taken direct from them without any connection across the many centuries between their dates. The most curious feature, however, is the occurrence of flutes, or hollow sinkings, in the verandah-supporting columns of the principal tomb. There are sixteen sides to each column, and each side is slightly hollowed, as if to emphasize the arris, or edge; and similar flutings appear, at a much later date, in the columns of the Greek Doric order, there being no known examples at intermediate periods to carry on the sequence. As to the origin of these, there have been many theories, but probably the columns were first left square (as they still are to some of the tombs), then octagonal by the removal of the edges, then sixteen sided; and then looking awkward, the sides were sunk for emphasis, as said above.

In another of the Beni-Hassan tombs there are two transverse rows of three columns each, the column forming quatrefoils on plan being composed of four reeds of large size, or possibly representations of four circular wooden posts of small section, bound round near the top by representations of grass binding, the interstices being filled with short filets. Above this binding the reeds swell out forming a bud-shaped capital, and above the capital is a shallow abacus. The columns taper considerably, and the form is one which came into very general use later on. As usual, the theorists have been busy as to its origin but it is perhaps best to record only that which is obvious.

Between the 12th and the 18th Dynasties there is an unbridged gap in the history of Egypt, all that is known being that it was

overrun by the Hyksos, or Shepherd kings. It was evidently a time of disorder, and no buildings of the period remain.

With the 18th Dynasty, however, there opened the greatest building epoch which Egypt ever saw, the Theban Period; as, also, this time was that of Egypt's greatest prosperity. Then it was that the Israelites were captives in Egypt, Rameses II., the third king of the 19th Dynasty, being generally believed to have been the Pharaoh who withstood Moses.

The great buildings of this period are all close together at Thebes, further up the Nile than Beni Hassan, and now take the form of huge temples arranged upon a well-thought plan, one story only in height, but majestic and awe-inspiring in appearance. Externally they were simple, forbidding structures, with plain walls inclined inwards and crowned with the invariable simple cavetto cornice, and with entrance at one end only, between huge masses of masonry, called pylons, in the form of truncated pyramids, again with the cavetto cornice crowning them. Internally the arrangement was always symmetrical round an axial passage-way, so managed that when standing at the main entrance a view was obtained through the entire length of the temple to the shrine of the deity at the extreme end. This would be as impressive a view as could well be imagined, through sunlit courtyards and dark pillared halls alternately, with brilliant, nay gaudy, colouring used lavishly upon the walls and columns.

A glance at the plan will show that the

great temple (or palace—probably both) at Luxor, a fairly typical example, was erected in three stages. The earlier portion dates to, at least, 1500 B.C.—the time of Amenophis III., a king of the 18th Dynasty. It consists of the shrine, with a great number of small chambers round it, then, in advance, a deep pillared hall, opening along its entire width into a great courtyard, with double colonnade on either side, the whole being closed by a pair of massive pylons with the entrance gate between. Later on another hall, comparatively narrow, with two rows of columns down its length, appears to have been added, another pair of pylons with entrance between being erected. So far, the usual axial arrangement was preserved, but in making the subsequent addition of another open courtyard, with a double colonnade all round, and with yet fresh pylons at the new entrance, the axis has been lost, and the plan of the courtyard is not rectangular.

Of a slightly later date is the temple at Karnac, it being generally ascribed to the time of Seti I. and his son Rameses II., circa B.C. 1400 to 1333. Its general arrangement is very similar to that of the temple at Luxor, save that a small temple has been inset into the side wall of the outer courtyard by Rameses III., as late as 1200 B.C.; and an outer pair of pylons was added again much later, in the Ptolemaic period. From the outer courtyard is entered a great pillared hall, famous as the Hypostyle Hall of Karnac.

(To be continued.)

HYPOSTYLE HALL, KARNAC. VIEW DOWN AXIAL PASSAGE.

Professional Items.

ABERDEEN.—The Aberdeen Young Men's Christian Association has under consideration a large scheme for the alteration and improvement of their buildings. Plans and the scheme now proposed show that with regard to the present front house of the Association's buildings, the front is to be taken down, and two storeys—inclusive of a mansard roof—added, making it altogether, including the basement, five storeys high. The main entrance will be placed in the middle of the elevation, instead of the side as at present, and will be surmounted by a tasteful pediment, with architrave. Ornamental belts sweep across the front of the building, and at the ridge of the roof the moulded cornice is surmounted by an effective granite balustrade. The internal arrangements of the front house will be a distinct improvement on the present conditions. It is proposed to take down the present side gallery, knock out the two corners at the south-east and north-east, in order to make the hall rectangular; further, to place the platform at the Union Street end of the hall, instead of at the side as at present; and, finally, to run a gallery round the three other sides, giving accommodation for 1000 persons, instead of 750, as at present.

BARRY.—The new Wesleyan Chapel, just opened at Barry, has been built at a cost of about £3400 by Messrs. E. R. Evans Bros., of Cardiff, from plans prepared by Mr. Budgeon, of the firm of Jones, Richards and Budgeon, architects, Cardiff. The elevations are of Newbridge stone with Bath stone dressings, the style of Architecture adopted being Early Perpendicular. The ornamentation, however, is almost limited to the treatment of the central part of the front elevation. This is uncommon, and the flowing tracery archway to the central door is effective. The width of the chapel at the transepts is greater than the length of the building from lobby to choir. It is anticipated that this arrangement will bring the minister in close touch with the congregation. Sitting accommodation is provided for 624 upon the ground floor, and when the galleries are erected (provision for them in the future having been made), the accommodation will be increased to about 1100. The choir seats are behind the rostrum, and will accommodate forty-six, with space for organ in addition. There are two vestries for the choir and minister, both rooms having access to a large parlour. There are no gallery supports and columns from the same to help carry the roof, which is in one span, light Bath stone pilasters carrying the ends of roof trusses. A novel feature in this chapel is that Jarrahdale Jarrah wood has been introduced as wood-block flooring in the aisles and elsewhere, the warm red contrasting well with the adjoining oak blocks.

BRIGHTON.—Extensive alterations to the structures on the Sussex County Cricket Ground, Brighton, are to be made. They consist of the building of a new grand stand on the site of the old wooden structure at the south end of the ground, construction of a professionals' dressing room, etc. The elevation of the new pavilion for the professionals will be of brick and of neat design. Owing to the room taken up by the raised seats which border the playing field, it will not be possible to have a terrace after the style of the members' pavilion, and therefore entrance will be gained by a double staircase in front of the building. This will lead to a balcony, and to the double doors, through which admission will be gained to the principal of the suite of rooms—a spacious sitting room, which will be common to the Sussex and visiting professionals. This room will be fitted with four large windows, which will take up practically the whole width of it, so that a perfect view of the play will be afforded. On either side of the sitting room will be a large dressing room. Each will be fitted with two windows and every requisite, and at the back of the suite of rooms will be lavatories. On

the ground floor will be the telegraph office and store room accommodation. The new pavilion will be over 50ft. long.

CARDIFF.—A beautiful three-light stained-glass window, from the studio of Mr. N. H. J. Westlake, has been unveiled in the Church of St. John the Baptist, Cardiff. The window is intended as the first of a series of four in the south aisle of the church, illustrative of the life and history of the patron saint.

DUNDEE.—Considerable progress has been made within the past few months in the erection of the large new structures in Dundee. The Royal Bank in High Street is now well under way; the mason work of the ground floor is practically completed, and the archway of the principal entrance is being set, while in the rear the underground safes are nearing completion. The new offices of the Pearl Assurance Company in Meadowside are well advanced, the walls having been brought up to the level of the fifth and last storey. The mason work is expected to be finished in the course of a month. This promises to be an elegant structure, and its fine proportions and details are generally admired. The offices of the Scottish Provident Institution, situated on the other side of the street, have not progressed so rapidly as was desired, owing to delay in the forwarding of the Rubislaw granite that forms a feature of the ground frontage. This difficulty, however, has now been overcome, and the work is going on steadily. The new post office may be said to be in the finishing stages, the plasterers, painters, and glaziers being busily engaged upon their respective branches of the work.

EDINBURGH.—The foundation-stone has been laid of the St. Mary's Cathedral (Dalry) Mission Buildings, situated at Caledonian Crescent, Edinburgh. The site has a frontage of about 48ft. The chapel, which is 50ft. long and 25ft. wide, is on the first floor, with one end to the street. Under it is a hall of similar dimensions for Sunday school purposes. These two form a gabled block at the eastern side of the site. Slightly recessed on the western side is the porch, and rising over it an octagonal tower containing the staircase, and surmounted by a wooden belfry. On the ground floor there is at the back a large class-room (24ft. by 22ft.) for the infants' Sunday school. A caretaker's house is provided on the first floor over the class-room. The general feeling of the design is a free treatment of fourteenth century Architecture, with a blend, notably in the belfry, of seventeenth century work. The chapel gable is treated in two stories. The whole buildings, which are well lighted and ventilated, will be warmed by hot water and illuminated by electricity. The chief contractors for the works are Messrs. W. and J. Kirkwood, and the architect is Mr. Henry F. Kerr. The total cost of the undertaking will be about £2800.

GLASGOW.—The students of the High School Building Construction Classes recently paid a visit to the East End sewage works, Dalmarnock. Over forty students were present, and were shown over the works by Mr. Bain. The works form one of the largest and most successful projects of the city, being wrought on a very economical and efficient basis. The total area of ground covered is about 19 acres, out of 28 available, and they deal with one-fifth of the entire sewage of the city.

GLOUCESTER.—The following recommendations were presented at a recent meeting of the Gloucester School Board: (1) That this Board proceed to provide new schools for the eastern districts of the city, upon a site about two acres in extent, now owned by the Corporation in Sandpits Road; (2) that the said new schools should accommodate, when completed, 720 boys and girls, and 400 infants in all; but that the arrangement should be such that, in the first place, only the portion of the buildings ultimately designed for the mixed school of 720 children shall be erected for the accommodation of a mixed school of 500 boys and girls

and 275 infants. (3) That provision shall be made upon the site for a cookery school, and for the residence of a caretaker. (4) That plans be invited from a limited number of architects, in competition, including the following:—The architects having business offices in the city of Gloucester; Messrs. Goodey and Cressall, Colchester, and the architects of approved board schools at Grimsby, Leicester, and Bristol. (5) That premiums be offered of £100, of £50, and of £25 respectively, to be awarded according to the merit of the plans received; the premium merging in commission in the event of the winner being selected to carry out the work." After much discussion, resolution No. 1 was carried; 2, 3, and 5 were referred to the committee; and with respect to 4, an amendment that plans be invited from architects having business offices in Gloucester only was carried.

LEEDS.—The granite balustrade in City Square, which forms a circle about 100ft. in diameter around the space where the equestrian statue of Edward the Black Prince is to stand, is almost completed. Around the balustrade eight small figures, representing alternately night and morning, are to be placed. Each figure will hold a 500 candle-power electric lamp. These figures are expected to be ready before the close of the present year, but 1899 will be well advanced before the central statue is ready for unveiling. The plans for laying-out the square were prepared by Mr. Bakewell, architect.

The Standard Life Assurance Company is about to erect new buildings on the site of the old post office in Leeds. The company recently purchased the site from the Corporation for £49,950, and acquired the property at the rear with a frontage to Wine Street for £11,000. The preparation of the plans of the new buildings has been intrusted to Mr. Archibald Neill, 18, Cookridge Street, Leeds, and the work will be carried out under his supervision. The design is Classic in character. The façade will be of stone, Bolton Wood in the basement and the remainder Portland. Internally the accommodation will comprise between forty and fifty suites of offices. All of these, with the exception of about four suites, will be lighted from the front, and the aspect being towards the south, their situation will be still more desirable. The main entrance to the building will be from City Square; the offices facing Park Row will have separate entrances. The basement will have an entrance at the lower side of the site. All the corridors will be broad and well lighted, and the various stories will be reached by an elevator as well as by staircases. Every apartment in the building will have its fireplace. Mr. Isaac Gould is executing the contract for the digging of the foundations. The estimated cost of the structure is about £30,000.

LIVERPOOL.—The laying of the corner stone of the new building being erected by the Royal Insurance Company has taken place. When the directors of the company decided upon raising a new building, competitive designs were invited, and the architect chosen was Mr. J. Francis Doyle, of Liverpool, whose plan was put first by the assessor, Mr. Norman Shaw, R.A. The style is Classic, adapted to modern requirements. The substructure is composed of grey Aberdeen granite to a height of 30ft. above the pavement level. The superstructure will be composed of white Portland stone, and roofed with green slates. To the Dale Street front will be a gable rising 110ft. above the pavement. In North John Street will be placed the main entrance (in situation identical to the present entrance), which will be surmounted by a tower 150ft. high, and which forms one of the principal features of the design. At the south end will be the entrance for tenants, which also is embellished by a tower, but of less importance than that of the main entrance. A noticeable feature in the building is the steel construction, mainly introduced to obviate the necessity of columns on the ground floor, which for the entire length will be utilised as the general offices of the Company. The main weight-carrying girders

are placed upon the third floor, resting at the ends upon steel stanchions built into the walls, and from which are slung the two floors immediately beneath. Internally it is intended very largely to utilise marble faience or panelling for the walls in lieu of the ordinary plaster, this material being reserved for ceilings only. The building, rectangular in shape, will be about 220ft. long by 52ft. wide, and on the ground floor the general office will be of the dimensions of 194ft. long, 48ft. wide, and 21ft. high. The new building will extend from Dale Street to the return side street, a distance of 212ft., but the present operation only consists of two-thirds. This length when finished will be occupied by the Royal, pending the pulling down and continuing the structure up to Dale Street.

MAESTEG.—A new church has been built at Maesteg. It is arranged upon a somewhat unusual plan. The nave is 67ft. wide, and is designed so that practically every member of the congregation may see the Communion table. On either side of the nave is a fine arcade, with clerestory over. The ground floor of the tower provides ample organ space, with choir vestry, and there is a large clergy vestry in the tower basement, with separate entrance communication by means of a staircase with the choir vestry above. The font is placed at the west end of the church, where a baptistery for total immersion is also provided. The pulpit is composed of green Bridgend stone, neatly carved, with red Irish marble shafts and bands of polished pink alabaster. The style adopted is the English first pointed. The tower is not completed, but is designed to attain a height of considerably over 100ft. The masonry is of an exceptional character, faced externally with ashlar, laid in regular courses, cement pointed. The dressings externally and internally are of Bridgend stone. The open timber roof is of pitch pine, left plain, and is covered with green slates. The west wall, so often a source of trouble, has been rendered impervious to wet by the introduction of a vertical asphalted damp course. The contractor was Mr. McGaul, of Bridgend, who carried out the work under the direction of the architect, Mr. G. E. Halliday, the diocesan surveyor for Llandaff.

OSSET.—The corner stone of a new church at Gawthorpe, Osset, was recently laid. Designed in the Perpendicular Gothic style of Architecture, the church will comprise a nave 61ft. 6in. by 22ft., with north and south aisles, each 61ft. 6in. by 10ft. 4in. The aisles are divided from the nave by arcades of four arches each. The arches are double-chamfered, and rest upon octagonal pillars with moulded caps. The chancel measures 29ft. 9in. by 22ft. 6in., and on the north side of it is an organ chamber 15ft. by 12ft.; on the south side vestries for the clergy (15ft. by 10ft.), and choir (15ft. by 11ft. 6in.). The building is being carried out from designs by Mr. Swindon Barber, late of Halifax, and by Mr. T. H. Farrar, architect, Halifax.

STOCKPORT.—At a special meeting of the Town Council the Mayor proposed a resolution in favour of the erection of a town hall, the cost not to exceed £60,000, but, after discussion, a proposition was passed favourable to the erection of a town hall without committing the Council to the amount to be expended. The question of a site was referred to the Town Hall Committee. It was also decided to erect a new fire station on a portion of the Mersey Mill site, Heaton Lane, from plans and drawings prepared by Mr. John Atkinson, borough surveyor.

WORTLEY.—The Greenside Wesleyan Sunday School, Wortley, is about to be rebuilt. Mr. C. F. Wilkinson, architect, of Park Square, Wortley, has prepared the plans. Constructed of stone, with a Gothic roof, a portion of the new premises will be two stories high. On the ground floor there will be an assembly room 53ft. long by 28ft. wide, and three commodious class-rooms. A fourth class-room will be provided on the upper floor. The new building is estimated to cost £600 or £700.

Under Discussion.

THE WINTER SESSION.

HYDRAULIC MACHINERY.

A meeting of the Royal Scottish Society of Arts was held recently in the Society's hall, George Street, Edinburgh, Mr. A. Beatson Bell, the president, in the chair. Mr. Peter Whyte, C.E., made a communication on the various hydraulic machinery at Leith Docks, of which he is the superintendent. After mentioning the fact that such machinery had first been used in Scotland at these docks, he proceeded to give a description of the various methods of working the dock gates by means of hydraulic power which are employed at Leith. Going on to speak of hydraulics in their application to the working of swing bridges, he stated that the Victoria Bridge at Leith, which had a clear span of 120ft., was, at the time of its erection in 1874, the largest bridge of its kind ever made. In this connection, he indicated the method to be employed for working the new bridge over the Water of Leith at Bernard Street.

"MODERN DETAILING."

At the monthly meeting of the Glasgow Architectural Association—the president, Mr. W. Tait Conner, in the chair—a paper by Mr. Henry D. Walton, on "Modern Detailing," was read in his absence. Detailing he viewed as something more than the mere enlarging of small-scale drawings. There are new conditions to be observed, and a treatment is necessary that differs from that applicable to the composition of façade. Guidance in the matter is much required, and here the architectural curriculum is lacking in definiteness. Mouldings in particular were specialised in the paper; one of their first essentials is that scale should be preserved throughout an edifice, a truth pretty generally acknowledged, though not always easy of expression. Diagrams were exhibited of the mouldings of the Strozzi Palace that have this quality of scale, and a comparison made with the too common modern usage of main cornice, subsidiary and string, all repetitions in varying size. Another diagram analysed the profiles, &c.

ITALIAN ART.

Mr. Paton, curator of Glasgow Corporation Galleries, has delivered the eighth of his weekly addresses on Italian Art, dealing with the Venetian painters, Giorgione's and Palma, the elder. After referring to Giorgione's boyhood and early training under Bellini, Mr. Paton remarked that Giorgione introduced easel pictures into Venice. Art, which had hitherto been patronised solely by ecclesiastics and rulers, now acquired commercial patrons, who employed artists to decorate their houses with frescoes and to paint subjects suited for the household from classical writers, Virgil, Ovid, &c., as well as from Holy Scripture. Referring to Giorgione's portraits, the lecturer said they were distinguished for their great simplicity and intensity of character. Giorgione was the first to treat of colour in relation to light and shade, and was the first real landscape painter. He was lofty in character, a lover of all beautiful things, extremely popular, handsome, tall, dignified, and he exerted a wonderful influence even as a youth. Of the vast number of works attributed to him, less than a dozen are generally admitted to be genuine. Mr. Paton then gave a brief account of Palma and his characteristics as an artist.

BENEFITS OF BUILDING EXCHANGES.

The first annual dinner of the members of the Glasgow Building Trades Exchange took place in the Windsor Hotel. The chair was occupied by Colonel Robt. J. Bennett.—Mr. Peter Laurence, president of the Edinburgh Building Trades Exchange, in proposing the toast of "The Glasgow Building Exchange," stated that Glasgow was the first to start such an institution in Scotland, but the movement had spread to Edinburgh and other parts of

the country. He spoke of the benefits of such exchanges, and mentioned as one of them that Scotchmen in any branch of the trade who went abroad and found ideas in evidence which they thought might be of benefit to those at home made use of the exchanges to communicate those ideas, so that Scotland was always kept in the forefront of the business.—The Chairman, in acknowledging the toast, said that in these degenerate days, when prices were cut to the lowest and corporations and co-operative societies were loud in the land, it was proper that such associations as theirs should be built up and play a useful part in guaranteeing good work, and insisting on a fair price to enable them to execute it.

"THE VERNACULAR OF THE WREN SCHOOL."

At a recent meeting of the Edinburgh Architectural Association—the President (Mr. Thomas Ross) in the chair—Mr. James A. Williamson, past president of the Architectural Society, read a paper on "The Vernacular of the Wren School," which was illustrated by a collection of limelight views. The lecturer gave an historical resumé of the Renaissance in Great Britain from the earliest period of its influence, in the reign of Henry VIII., till the beginning of the seventeenth century, when the architectural authority of Inigo Jones became paramount. Mr. Williamson stated that Inigo Jones was the first Englishman to grasp in its full significance the art of the Italian Renaissance. The works of Inigo Jones were minutely described, particularly the palace at Whitehall for James I. This work, the lecturer considered, showed that Jones possessed a complete mastery of proportion, a keen sense of the balance of voids and solids, and full knowledge of the value of chiaroscuro. He was one of the most brilliant architectural designers this country has ever produced. Sir Christopher Wren, as the acknowledged head of the school, was next dealt with in an exhaustive manner, and his several outstanding achievements in design described in detail, notably St. Paul's, Hampton Court Palace, St. Mary-le-Bow, and Walbrook. Mr. Williamson claimed that Wren founded a strictly vernacular school of Architecture based on the principles of Italian Renaissance, and that, never having visited Italy, he approached the study of his great works with a mind free from the trammels of precedent, in which, perhaps, the instinct of the engineer rather than the artist predominated. The lecturer concluded by referring to the eclectic and cosmopolitan character of the Architecture of the present day, arguing in favour of a return to the best examples of the Wren school, with a view to a logical development of the spirit then in force towards perfection on traditional and vernacular lines.

GLASGOW CATHEDRAL.

In the eighth of his Art lectures, delivered in the Glasgow Corporation Art Galleries, Mr. T. L. Watson took for his subject "Glasgow Cathedral." He referred to the influence upon the development of Gothic Architecture exercised by the numerous and destructive fires which occurred in the large churches of the eleventh and twelfth centuries. In order to make their religious buildings enduring as well as beautiful, the whole energy of the designers was directed to the problems of covering them with stone vaulting, and this resulted in the evolution not only of the arch rib vault, but of the pointed style of Architecture. The earliest building of importance at Glasgow, the church erected by Achaius in the early years of the twelfth century, was destroyed by fire in 1176, and a parallel to this was found in Canterbury, where the choir of the Cathedral, erected at the same time as the church of Achaius, was burnt down in 1174. While we knew nothing about the destruction of the building at Glasgow beyond the date, a minute and picturesque description of the fire at Canterbury by an eye-witness, together with a valuable account of the operations which followed, had come down to us. From this Mr. Watson read several extracts. The rapidity

with which the rebuilding of the choir at Canterbury had been carried out was contrasted with the prolonged operations under Bishops Jocelyn, Walter, and Bondington at Glasgow. The choir and lower church, it was stated, were almost wholly of the thirteenth century, a period when there was no appreciable difference between the Architecture of Scotland and that of England. We had thus the broad basis of English archæology to ground upon, and in contrast with other parts of the building and with many other buildings in Scotland, its Architecture was particularly clear. The Architecture was of five distinct dates, each separated from the others by an interval sufficient to mark the development of the style. This development was indicated by a change of general design and by the introduction of a new type of moulding in the vaulting ribs in each section, which formed a regular sequence and illustrated the development of vaulting during the thirteenth century.

MATERIAL AND DESIGN IN POTTERY.

Mr. William Burton, lecturing at the Manchester Municipal School of Art, on "Material and Design in Pottery," said that the application and use of glaze must not be regarded solely from the decorative point of view. The most important reason for the use of glaze was a strictly utilitarian one—that it served to render ordinary pottery impervious to liquid. There was an important group of pottery which from the nature of its clay material was not so dependent on a coating of glaze, and which might indeed be sufficiently impermeable without the addition of a glaze coating at all. The name "stoneware," so generally applied to this class, was an excellent one, for most of the older specimens had practically the colour and the same evenness of grain as a good freestone. The simplest members of this important group were only to be distinguished from earthenwares and terra-cotta by their greater density and their diminished porosity. Owing to their partial vitrification they emitted a much clearer and more ringing sound when sharply struck. But at the other end of the group were found examples so white and translucent, as well as so vitrified, that they were hardly to be distinguished, even by an expert, from true porcelain. The group of "stonewares" formed a natural connecting link between earthenware and porcelain; and a knowledge of it formed the best possible preparation for a study of the highest form of pottery—the porcelains. Mr. Burton passed on to a technical account of the production of the earliest stoneware pieces. In early days stonewares, though often so vitrified as to need no glaze to enable them to retain fluids, were very frequently smeared, before firing, with a coating of ferruginous clay, which, melted at a high temperature, produced a dark-coloured sort of glaze of a perfectly natural kind. This variety of glazed stoneware was largely made in most European countries for use among the peasantry even at the present time. Its place had never been quite supplied by the finer and whiter modern earthenwares. The German and Flemish potters of the sixteenth century elevated stoneware into a distinct and artistically important pottery group by the invention of salt-glaze, which had made the stoneware group complete in itself, and quite distinct from either earthenware or porcelain, to neither of which could a salt-glaze be applied. The lecturer described the method by which the strongly heated ware was entirely enveloped in common-salt vapours, forming salt-glazed stoneware, which was one of the simplest, but most technically perfect, forms of pottery known. The glaze was brilliant and most perfectly adherent to the body. It was so thin, too, that the finest and sharpest work of the modeller retained its crispness and vigour.

MESSRS. JOHN MARSHALL AND SONS, builders, Hawick, have received instructions to erect the monument which the Edinburgh Border Counties Association has resolved to put up at Ettrick Hall to mark the birthplace of James Hogg, the Ettrick shepherd. The architect is Mr. Heiton, Perth.

Correspondence.

NOTTINGHAM COMPETITION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—With reference to your excellent account of the above, might I mention that there is no such firm as Messrs. Robson and Newberry, and that the design was sent in by Philip A. Robson and John C. Newberry, Assoc.R.I.B.A.—I am, dear Sir, yours faithfully,
PHILIP A. ROBSON.

Enquiry Department.

NOTICE.

Readers manifest a desire from time to time to assist those who avail themselves of the Enquiry Department instituted in this Journal, and many supplementary replies answering points raised in the Enquiry Department have been received from all quarters. The Editors, therefore, have decided, in order that Enquirers may benefit also by these kind offices, to publish the supplementary answers, in addition to the answers supplied by the technical experts associated with the staff of the Enquiry Department. The more widespread the information, the more effectually will the purposes of the Enquiry Department be served, and the Editors invite replies from any to whom the questions appeal, as they appear. Such answers must be to hand not later than Saturday morning for the forthcoming Wednesday's issue.

WORKING DEEP LEVELS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I should feel extremely obliged if any of your readers could explain the method of working out or reducing levels, when the datum comes out above the site levelled. I have made a sketch of my level book, which I think asks for itself what I want.

B.S.	I.	T.S.	Rise.	Fall.	R.Levels	
2.93	8.56			5.63	2.00	Bt. For.
	6.75		1.81			
	10.01			3.26		
		10.99		0.98		

Yours faithfully, "LEVELLOR."

EXTERNAL WALLS IN DOMESTIC BUILDINGS.

ARCHITECT (Guildford).—There can, in our opinion, be no doubt in this case that the District Council is quite right in its contention—that, in fact, it would have been neglecting a clear duty had it not insisted on the wall being made 13½ in. thick, in compliance with sub-section (k), evidently specially devised to meet precisely such a case as this.

PROFESSIONAL CUSTOM.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Wishing to have a house built, I interviewed an architect and surveyor (a personal friend) who agreed to undertake the matter for a considerably reduced fee (i.e., much less than the usual five per cent.) His account is strictly in accordance with the arrangement, but I find he has received nearly £20 from me, through the builder, for getting out the quantities, he having instructed the builder to add this sum to his estimate. Under the circumstances is this a fair and proper action on his part?—Yours faithfully, M. A. T.

Though the architect would have done more wisely, and have been more open, had he first

told his client that he was going to prepare quantities and charge for them through the builder, he only did what is customary in the provinces. In London it is usual to employ an independent quantity surveyor, but it comes to the same thing so far as the client is concerned; the architect appoints the surveyor, the quantities are paid for by the builder, and the money comes out of the owner's pocket, being added to the builder's estimate. By the way, is it the act of a "friend" to expect a professional man to work for him at a reduced fee?

WHOSE MODEL?

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Is plaintiff justified in retaining the joint model after defendant has lost the action and paid all costs? Should not the model become the property of the party who pays the costs?—Yours, etc.,

"PROTRACTOR."

Our Solicitor replies as follows:—"If the plaintiff's costs include the sum paid by him as his half of the expense of the joint model, then, when the costs have been paid by the defendant, the model becomes, I think, the sole property of the latter."

ANCIENT LIGHTS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Can you kindly inform me how many years undisputed right it takes to qualify for an easement as regards ancient lights, and, failing such qualification, how should such lights be blocked up?—Yours faithfully,

"AN OLD SUBSCRIBER."

Twenty years. Any effectual obstruction to the access of light, e.g., a wall built up close to the window, or a hoarding erected there. Care must be taken in doing the work necessary to block up the window, not to commit any trespass, e.g., by building or resting anything upon any part of the wall in which the window is.

ADOPTED PLANS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I instruct an architect to prepare plans, &c., for a house, which is duly built and inhabited by myself. A year or so later, I desire to build a nearly, but not quite, similar structure, on an adjoining plot, without further architectural assistance. Am I justified in adapting the plans of my first house for the purpose?—Yours faithfully, T.

In a strict legal sense, you are justified in doing as you propose, but the architect in question would certainly feel aggrieved, and it would be better to come to an arrangement with him. Under such circumstances, architects will generally charge only for making copies of the plans already prepared for the first house, and of its specification—with, in this case, a little extra for proposed alterations—and for supervision of the work. It is well to bear in mind that competent supervision may well, by securing sound construction and good materials, save many times the amount paid for it.

PLANNING OF SKITTLE ALLEYS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I shall feel extremely obliged if you could give me some particulars as to the planning of skittle or bowling alleys, such as would be adjoined to an hotel or club—a few leading points to be observed in the construction of the same, such as the proportion of length to width and height, whether top or side lights would be best; also the best materials for the construction of the alley.—Faithfully yours, "GAME."

At a meeting of the Bradford City Council a long discussion took place on an amendment to pay £100 extra to Mr. Barker, architect, for his services in connection with the erection of the new electricity works, which had cost £11,000 instead of £7000, as originally estimated. The resolution was that Mr. Barker should be held to a contract for £250, but the amendment was carried by 35 votes to 14.

Trade and Craft.

MESSRS. GIBBS AND CANNING.

Messrs. Gibbs and Canning, Limited, whose buff clay in terra-cotta work is held in great repute, inform us that they are now fully represented in London. Their representative will always be pleased to call in reference to any architectural terra-cotta work in view. The address of the firm is New Inn Yard, Tottenham Court Road, W.

LIBERTY AND PROPERTY DEFENCE LEAGUE.

The report of the Liberty and Property Defence League for 1897 states that the number of individual members continues to increase, and gives the number of societies representing the various interests in the country which are federated with the League as 207. The chief interest in the report centres in the League's Parliamentary work. The successive steps comprised in the process of Bill "blocking" are catalogued, and particulars given of the part taken by the Parliamentary Committee of the League in securing the defeat of various Bills affecting land and house property, railways, mines, trades and manufactures, shipping, and the liquor trade. For instance, as regards the London County Building Bill, the League published a pamphlet, which was sent to every member of the House of Commons, with the result that a strong feeling of opposition to the measure was aroused. In the House of Lords the League chairman (Lord Wemyss), with a view to calling attention to what the League regarded as the absurd and mischievous character of Lord Londonderry's Working Men's Dwellings Bill, introduced a "logical" Bill to provide facilities for the acquisition by occupiers and occupying ratepayers of their dwellings, and this action the League claims had something to do with the fate of the other measure, which, although read a third time in the House of Lords, did not reach the second stage in the Commons. Strong endeavours were made to obtain the rejection of the Workmen's (Compensation for Accidents) Bill. It will be remembered that to achieve this object Lord Wemyss unsuccessfully divided the House on the third reading.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

CAMBRIDGE.—For the construction of roads, bridges &c., for St. John's College. Messrs. J. Carter Jonas and Sons, surveyors. Quantities by the surveyors:—
W. Bell and Sons £5,337 15 8 Siddons & Freeman £3,737 0 0
W. Saint... 4,994 0 0 Sindall... 5,649 0 0
Thos. Adams... 4,485 0 0 Chas. Kidman...
Swann Bros... 4,126 13 0 Sturton-street,
G. Bell... 3,945 10 0 Cambridge* 3,602 8 0
Coulson and Lofth 3,840 0 0 *Accepted.

EWELL (Surrey).—For the erection of a house on the London-road, for Mr. J. Stradwick. Messrs. Burdwood and Burdwood, architects, 4, Berkeley-road, Crouch End, London, N.:—
Kendall, Ewell... £294 Powell, Worcester Park* £335
Killick, Ewell... 355 *Accepted.

GRAVESEND.—For the erection of (1) market buildings, and (2) fire-engine station, mortuary, &c., for the Town Council. Mr. Edmund J. Bennett, architect, 24, Darnley-road, Gravesend. Quantities by Mr. W. Hawker:—

	Market.	Fire-engine station.
Thomas and Edge	£2,708	£3,914
Rayfield	2,564	2,995
Gorse	2,554	1,015
Martin	2,554	968
Tuffer	2,552	925
Multon & Wallis, Gravesend*	2,499	899

*Accepted.
HENDON.—For the construction of 1,240 yards of 12in. sewer, including manholes, lampholes, flushing chambers, etc., at the Hyde, for the Urban District Council of Hendon. Mr. S. Slater Grimley, engineer:—

	Best London stoneware pipes.	Best approved country pipes.
C. Ford	£2,332 0 0	£2,237 0 0
M. S. Kitteringham	2,328 19 3	2,232 14 3
Allen Bros.	1,984 11 2	1,910 16 2
E. W. Hollingsworth	1,958 0 0	1,853 0 0
W. Neave and Son	1,946 0 0	1,813 0 0
Rich. Ballard, Ltd., Child's Hill, N.W.*	1,918 0 3	1,764 11 11
H. Lee	1,894 10 10	1,814 0 0
T. Adams	1,789 13 3	1,698 12 5

*Accepted in consequence of two tenders (a and b) taken together being the lowest.

LONDON.—For the erection of factory and warehouse, Valentine-place, Blackfriars-road, S.E., for Mr. James Pascall. Mr. W. H. Woodroffe, architect, 214, Great Dover street, S.E.:—
Hall, Beddall, & Co. £13,760 W. Smith and Son... £12,287
Higgs and Hill... 13,284 Harris and Wardrop... 11,623
George Parker... 12,295 James Smith & Sons* 11,227
*Accepted.

LONDON.—For alterations to the Manor House, including the erection of boiler-house, chimney, and two lodges, and for the erection of temporary buildings, for the London County Council:—

Alterations and additions to Manor House.
Leslie and Co. £22,429 Kirk and Randall* £20,812
W. Harbrow... 21,711

Erection of temporary buildings.
E. C. & J. Keay £77,798 0 0 Kirk & Randall £68,000 0 0
F. Gough & Co. 72,897 0 0 Humphreys...
W. Harbrow... 70,489 0 0 Ltd. 66,556 0 0
Hawkins & Co. 68,763 11 1 Leslie and Co.* 64,263 0 0
*Accepted.

The estimate of the asylums engineer in respect of the former work is £16,679, and in respect of the latter, £64,950.

LONDON.—For the erection of a block of flats (Block 1) at Sloane-court, Chelsea, S.W. Mr. Paul Hoffmann, architect, 152 and 153, Palmerston-buildings, Old Bond-street, E.C. Quantities by Messrs. Dunk and Bousfield, Billiter-square-buildings, E.C.:—
John Allen and Sons £18,950 C. F. Kearley... £18,610
Fred Britton... 18,900 Grover and Sons* 18,178
*Accepted.

LONDON.—For the erection of school, Eldon-road, Lower Edmonton, Middlesex (a three-floor school, with central halls, site covering 2½ acres of land), for the School Board for Edmonton. Mr. H. W. Dobb, architect, 110, London-wall, E.C. Quantities by Messrs. Young and Brown, 7, Southampton-street, W.C.:—
C. Gray Hill... £24,000 James Monk, Edmon-
E. Lawrence and Sons 23,360 ton* £22,810
*Accepted, subject to the approval of the Education Department.

LONDON.—For conversion of stable building, situate on the corner of William Street and Kingscote Street, into a warehouse for Messrs. Spicer Bros., Limited. William Smith, A.R.I.B.A., architect, 65, Chancery Lane, W.C.:—
Rider and Sons £1,578 Matlock Bros. W.C. £1,323
Ward and Lambie... 1,571 Stevens Bros.* £1,311
Wall and Co. 1,528 (Youge Park, Seven Sisters Road, N.)
Larke and Sons... 1,336
*Accepted.

LONDONDERRY.—For erection of stores, Strand Road, for Messrs. Robert Cooke and Co., oil merchants, London-derry, including machinery:—
Joseph Ballantine (accepted) £1,200.

KING CROSS (Halifax).—For the erection of wood-working machine works, with pattern shop, show-room, offices, and appurtenances on the Kenton estates. T. Lister Patchett, architect and surveyor, Halifax:—
Ben. Riley, Halifax... £1,340 10 0
John Dixon & Son, King Cross, Halifax 526 0 0
John Berry, Bank Foundry, Halifax 553 0 0
John Naylor and Son, Halifax 98 0 0
Joseph Bancroft and Son, Halifax 247 15 5
Total work let... 2,765 5 5
Do. Lowest tenders... 2,378 11 5
Do. Highest do. 3,148 5 0

RUSHDEN.—For the erection of cottages at Rushden, as per quantities supplied by Mr. H. Knight:—
T. Swindall... £3,505 R. Marriott... £3,345
C. E. Bayes... 3,500 H. Sparrow... 3,340
T. Willmott... 3,429 Whittington & Tomlin 3,315
F. Henson... 3,395 F. and C. Berrill* 3,295
Hacksley Bros... 3,390 *Accepted.

ST. ALBANS.—For erecting a house, Beaconsfield-road, for Mr. W. F. Fenne. Mr. Percival C. Blow, architect, 7, London-road, St. Albans:—
Miskin... £966 0 Savage... £800 0
Bushell... 895 0 Sparrow (accepted) 739 10
Dunham... 830 0

R. I. B. A.—A young ARCHITECT in PRACTICE is open to COACH by Correspondence a few CANDIDATES. Terms moderate.—Apply "Coaching," Office of BUILDERS' JOURNAL.

ASSISTANCE RENDERED by Architect, Silver Medallist, at his own office. Working drawings, tracings, &c. Colour perspectives made a special study. Charges moderate.—7, London-road, St. Albans.

R. I. B. A., SOCIETY OF ARCHITECTS, and CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparations by correspondence or in residence. Fourteen first places.—G. A. T. MIDDLETON, 19, Craven-street, Strand, W.C.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R. I. B. A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, and twelve months' courses. Any subject taken separately. Special three months' course for any of the Exams. at reduced rate.—For full particulars apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to British Museum).

BUILDERS desirous of TENDERING for ERECTION OF A NEW PARISH CHURCH at Gwyne, near Llangadock, in the County of Carmarthen, may send in their names to the undersigned,
E. H. BRUTON, F.R.I.B.A., Architect,
15, Queen-street, Cardiff.

CITY OF BIRMINGHAM. MAGNIFICENT BUILDING SITE IN THE VERY HEART OF THE CITY. TENDERS are invited for LETTING ON BUILDING LEASE, for a term of 99 years, from MARCH 25th, 1898, the LAND bounded by New-street, Paradise-street, Colmore-row, Waterloo-street, and Christ Church-passage, Birmingham, and forming the site of Nos. 72 to 79, New-street, Christ Church, and No. 3, Christ Church-passage, and having a total area of about 247½ square yards.

For plan and further particulars apply to BLOXHAM, SMYTHE, AND ETCHES, 106, Edmund-street, Birmingham.

APPOINTMENTS VACANT.

ARCHITECT in Reigate, Surrey, has a VACANCY for Gentleman's Son (aged about 17) as PUPIL. No premium required.—Apply, B. Z., Whitmore's, Bell-street, Reigate.

COSTING CLERK REQUIRED. Accustomed to Builder's or Engineer's office. Must be quick at figures. One with knowledge of Architectural Drawing preferred.—Address, stating age, salary expected, with copies of testimonials, to Box 643, Office of the BUILDERS' JOURNAL.

REPRESENTATIVE WANTED for Town and Country, to keep before Architects, &c., Special Appliances in general use (no orders taken). One having a previous acquaintance with Architectural Work preferred. Good appearance and address a sine qua non.—Address, stating age, qualifications, salary expected, &c., to Box 644, Office of the BUILDERS' JOURNAL.

ST. MARTIN-IN-THE-FIELDS, WEST-MINSTER.

The Vestry of the above Parish require the SERVICES of a SURVEYOR between 25 and 40 years of age.

He will be required to devote the whole of his time to the service of the Vestry, to attend to the duties of his office at such times and in such manner as the Vestry may determine, and to perform all the duties which a surveyor is required to perform under the Acts administered by the Vestry.

He will be required to reside at a distance not greater than two miles from Charing Cross.

An inclusive salary of £900 per annum will be given for the first year rising by annual increments of £25 to £400.

Applications for appointment endorsed "Candidate for Vestry Surveyorship," must be accompanied by copies of three testimonials of recent date and be delivered to the undersigned at the Town Hall, Charing Cross-road, W.C., not later than FOUR p.m. on MONDAY, MARCH 7th next.

G. W. MURNANE, Clerk to the Vestry.
St. Martin's Town Hall,
Charing Cross-road, W.C.
February 23rd, 1898.

NOW READY. Price Four Shillings.

Laxton's Builders' Price Book FOR 1898.

"The acknowledged standard work of reference." CONTAINING ABOVE 72,000 PRICES.

Together with many useful and important Memoranda and Tables, and Prices and Descriptions of New Materials and Inventions suited to the Builder, Contractor and Engineer, and all Trades connected therewith.

The whole carefully corrected and revised according to the present Prices of Materials and Labour. Contains:

THE LONDON BUILDING ACT, 1894;

also the RULES OF PROCEDURE IN CASES to be brought before the TRIBUNAL OF APPEAL appointed under the LONDON BUILDING ACT, 1894; Bye-laws of the London County Council and the City of London; also Regulations by the Council applying to Theatres and other Places of Public Amusement; List of Aldermen and Councillors of the London County Council; also the District Surveyors, with their respective districts.

Notes of Cases & Decisions in the Superior Courts.

KELLY'S DIRECTORIES, LTD.,

182, 183, & 184, HIGH HOLBORN.

SIMPKIN, MARSHALL, HAMILTON, KENT & CO. Limited, Stationers' Hall Court, E.C.

AND MAY BE ORDERED OF ALL BOOKSELLERS.

"EMPRESS"

SMOKE

CURE.

The "Empress" Smoke Cure has held its ground with constantly increasing sales for many years, and is now widely recognised as the best chimney pot.

Full Particulars of Sizes, Prices, &c., on application to the Makers—

EWART & SON.

346, Euston Road, LONDON N.W.

ESTABLISHED 60 YEARS.

An Architectural Causerie.

A False Issue? We have lately passed through a period of some excitement with reference to the restoration of the west front of Peterborough Cathedral. Now that this excitement has died away, perhaps there might be an opportunity to ask whether the attitude of those who so zealously defend our ancient monuments from the hand of the restorer is always a sufficiently broad-minded

one which is old? Is not an artist's first concern—as an artist—with the Art—the human skill—which a building displays, not with the glamour of age, or the accidental beauty with which Nature has endowed it, though, as a man, he feels these things as others feel them? Perhaps we sometimes deceive ourselves, and, admiring an old building for the charm that time has thrown over it, invest it in our imaginations with artistic qualities which it does not possess, and which, if present, are quite independent of age, or the softening and harmonising hand of Nature. The added charm which Nature gives—the beauty of weather stains, the delicious quality and texture of surface—is no compensation to the architect for feeble planning, false construction, and the absence of composition and proportion, though to the painter who cares for none of these things, it may be all in all. Are we not too apt to assume that every old building is a fine work of Art because it is old, and, if it is threatened, to defend it as a fine work of Art, when it may not be such? Or, where it has a certain degree of artistic merit, to wildly exaggerate that merit, to make a stronger case? In the late contro-

who might think that their sympathy and support would be understood as an approval of methods, and an acknowledgement of claims, neither of which seem to them to be just and right. We value all old buildings for a thousand reasons. Because they are old; because our forefathers built them; because there clings round them a faint and delicate perfume of far-off days, which speaks to us of the human life of the past. Some of them speak to us in the language of Art also, in greater or less degree, and some do not. To confuse the two, to raise false issues, is to take the sacred name of Art in vain.

A. R. J.

The Beautification of London. For very many years Art lovers and others have pointed out what vast opportunities are afforded by our noble Victoria and Albert Embankments and Thames bridges for the beautification of our huge metropolis, which, though rich in favourable sites, is yet utterly deficient in statues—we do not mean of the one-man

LIVERPOOL ARTS AND CRAFTS EXHIBITION. ENTRANCE LODGE AND GATES AT LISS. DESIGNED BY W. H. SETH-SMITH.

attitude—whether these buildings are always defended for the right reason? It does seem, that, in the heat of controversy, the primary reason for which a building is erected is apt to be overlooked. More emphasis is laid on the fact that a cathedral, for example, should be a delight to the eyes of the appreciative connoisseur, a volume in which to read the history of the past, than on the fact that it is, first of all, a temple in which to worship the Deity. Do we not sometimes confuse human and historic interest with artistic interest? There are buildings of supreme human interest, of immense historic importance, which have little or no value as works of Art—as fine designs. Is not their human and historic interest alone sufficient to justify their preservation from the blighting touch of the restorer? Cannot he be condemned for outraging human sentiment and falsifying history, without being charged with the additional crime of destroying priceless and unique artistic creations? Sometimes he may do this as well, but usually he does not; priceless masterpieces of design being rare in this country, he does not often get the chance. Is not a good design which is new of more artistic importance than an indifferent or bad

versy, we heard the west front of Peterborough eulogised in terms which must have appeared, even to many architects who have a genuine admiration for this building, the terms of extravagant exaggeration. Everything is relative, and, if we exhaust the language of eulogy over this west front, what is there left to say of the unquestioned masterpieces of antiquity? The particular circumstances of the erection of this front, which add to its peculiar interest as history, detract from its value as Art. If defended on the grounds of history and human associations, and a certain degree of artistic value, every educated man must sympathise; but if defended as one of the grandest masterpieces of Art the world has ever seen, one cannot but feel that a false issue has been raised. It may be that any reason is justifiable, any exaggeration permissible, if only it help to impress the ignorant, to rouse the indifferent, and to save the building. To the practical man it may not matter how it is saved, as long as it is saved. But, at the same time, an extravagant attitude may have the result of alienating the support of those who retain some sense of proportion, who value the truth even above old buildings, and

order, which are all too plentiful—but of the group, allegorical or otherwise. Some years ago the Corporation put up a trial group in plaster at the head of Blackfriars Bridge, but after allowing sufficient time for it to become well coated with London soot, it was taken down, and buried with the scheme, never to be heard of again. Bases innumerable exist all along the river walls of the two Embankments, but not a single work of Art—if we except the handsome gas standards, which are really creditable—is to be found thereon. In the gardens are many statues, but the great majority of them are inartistic and ill-placed—the greatest monstrosity among them all being the latest—that of the Queen, facing Blackfriars Bridge, which is out of place in every respect. Going to the other end of the magnificent riverside boulevard, we now have a trial essay of Thornycroft's monument to Queen Boadicea, the only British warrior-queen our history affords. This, undoubtedly, is a fine piece of work, both in design and composition, and we hope to see the completed bronze work find a permanent situation here, beneath the shadow of our noble Houses of Parliament and within sound of the bells of the Abbey. As Frenchmen

have done justice to the memory of Charlemagne by the erection of the fine group before the Cathedral of Notre Dame, as Germans have done for Frederick the Great, and as Russians have done for Peter the Great, so ought we to do for those who have made our history and our nation what it is, though, of course, from this point of view, the traditional Queen Boadicea does not rank first. The only grouped memorial to which we can point in all London is the monument to the Iron Duke, and puerile as this is, it occupied fifty years in the accomplishing. Besides the many bases and sites which exist on our embankments and bridges, there are others in our parks and gardens, and at Trafalgar Square, where, if the National Gallery were only adequately ornamented, one might forgive and forget the wretched pepper-boxes which keep watch and ward over some of the finest pictures in the world. Why cannot some of our rich City merchants commission a few groups of statuary for the beautification of the Metropolis? The Boadicea group, as is well known, is the result of the heroic work begun by the late Mr. Thomas Thornycroft no fewer than forty years ago, while the complete group is given to the public by his son, Mr. Hamo Thornycroft, R.A., and provisionally accepted by a committee, of which Mr. W. J. Bull is the honorary secretary. The bronze casting has been successfully accomplished by Messrs. J. Singer and Sons, of Frome, the cost having been defrayed by public subscription. The figure of Boadicea is 18ft. in height, and the right hand grasps a spear, while the left is upraised as though to urge on the horses. The plaster cast weighs five tons. Cowper's words—

"Regions Caesar never knew,
Thy posterity shall sway,"

are on the pedestal, which will be given by the County Council, while the Government will provide the site. It is to be hoped that soon Queen Boadicea and her attendant maidens will be an accomplished fact in London, and that it will not be long before some companion groups—allegorical and otherwise—are erected. W. N. B.

EXCAVATIONS AT DELPHI.

M. PAUL PERDRIZET, the distinguished French archaeologist, in an address on the recent excavations by his countrymen at Delphi, gave a description of the tour of the precincts, starting from the Treasury of the Athenians and ending with the Stadium. He dwelt especially on the interest of the ancient precincts of Gaia, the Earth Goddess, the primitive mistress of the oracle displaced by Apollo. The rock of the Sibyl, the traditional seat of the first priestess, was shown, and M. Perdrizet hazarded the very interesting conjecture that the unfiled *omphalos* found in the Treasury of the Athenians was the original altar of Gaia herself. The beautiful, though badly mutilated, metopes of the Athenian Treasury were also exhibited. The Temple of Apollo was discussed, and in the course of its history the lecturer made clear how again and again it had suffered destruction from earthquakes. The Temple, of which the foundation has been laid bare by the French, is of the fourth century B.C., but built into its foundation at the west end are portions of the earlier Temple of the Alkmaonidae; fragments, too, of the sculptures of this earlier Temple remain in the mass of *débris* heaped up when the ground was cleared for the new structure. Below the foundations of the west portion of the Temple are clearly traceable the rocks that once formed the prophetic chasm noted by Aristotle as within the temple. While the French excavations were in progress Delphi was visited by an earthquake, which M. Perdrizet vividly described.

MR. T. G. TAYLOR, Douglas, Isle of Man, has been appointed Borough Surveyor of Ramsgate.

GABLES.

AS ADJUNCTS TO DESIGN.

IN any representation or description of domestic buildings, even of the humblest character, it is remarkable with what avidity artists, poets, and writers of fiction seize upon the picturesque feature of the gable. When the painter of the most conventional landscape adds a cottage to his woodland scene, it is the gable end, surmounted with its snug thatch or weathered tiles, which peeps out from between the neighbouring elms. Of such little dwellings it has been said that each is a poem in itself, and well have our English poets, from Chaucer to Tennyson, confirmed the idea. Nathaniel Hawthorne could hardly have given his famous romance a more piquant and attractive title than the "House of the Seven Gables." For how could such a habitation have anything but a charming and romantic history? To begin with, it must obviously have been a detached house, standing almost certainly

IN A PICTURESQUE LOCALITY,

and with garden and grounds of corresponding character. Not that the novelist leaves us in any doubt about the matter, for he gives a most graphic and loving description of the rusty wooden building, standing back from the street of a New England village, with its seven acutely peaked gables pointing on every side sharply towards the sky, and presenting the aspect of a "whole sisterhood of edifices breathing through the spiracles of one great chimney." Of course, the windows were lattice, with diamond-shaped panes; and it is only in harmony with the slumbrous old-world air which pervades the whole, that the inmates of the house should take their time from a sundial set in one of the principal gables. Modern dwelling-houses are not generally designed on a plan that will produce seven gables, though a great many are daily rising around us which give the

GRATEFUL RELIEF

of one or two. The street architecture of the period is conspicuous by the employment of this suggestive feature; and we have only to contrast the greater of the new erections with those they have displaced, or with such as still neighbour them, to become aware of the immense difference between the two types. Apart from their general dinginess, the monotonous effect of London houses, from the Georgian era to at least the end of the first half of this century, was largely due, the Globe asserts, to the almost entire absence of the gable. The necessary contiguity of the buildings in closely aligned streets, and the purely utilitarian views which prevailed in their construction, not only made gables a difficulty, but also supported—if it did not give rise to—the idea that they were not worth the trouble of introducing. In the then dreary dearth of artistic taste and impulse, when our grandfathers succumbed to the dominating influence of "the house unbecomingly" within, it is not very surprising that they should have been indifferent to what did not touch them so nearly, the appearance of their dwellings from without. Of course, in a long row of houses of this character, a true gable was only possible to such as stood at a convenient corner, or were at least on one side detached from an obscuring neighbour. But the eye, ranging up the depressing wall of sad-coloured brickwork thus disclosed, found no other termination than a sordid chimney-stack, surmounted in its turn by no more artistic finial than that which is known to fame as the "London chimney-pot." In modern houses, both detached and otherwise, and by no means of an ambitious character, gables almost necessarily figure. The Strand—when divested of the distraction of its traffic, always the most picturesque of London thoroughfares—now presents a wonderful vista of these cheerful and almost life-giving features; and the same may be said of the great mass of building which has risen during the last few years at the West End and beyond it. In some composite erections,

"altered and enlarged" by many occupiers—or, perhaps, by the varying mind of one—the gable sometimes appears as a more or less picturesque excrescence. Not seldom a dormer window has been "put in" in the roof, and the spectator finds himself face to face with its retiring little gable, fitting apex to the pleasant casement, perched—like a post of observation for beauty's eye—beneath. To perfect such a coign of vantage requires the familiar aid of the

EAVESDROPPING IVY;

but this, of course, is a piece of domestic taste which does not devolve upon the architect. When such an addition is fittingly made, it gives a wonderful air of cosiness and repose to the most substantial dwellings; and it is the saving grace of much of the suburban architecture now overwhelming us that it allows scope for some artistic treatment of the gable. Amid the enforced repetition of details, and the somewhat threadbare complaint against the iniquities of the jerry-builder, we are apt to lose sight of the real merits of design possessed by so many of the erections of villadom. A new terrace, or suburban road, involves of necessity a building scheme of almost endless repetition. But we have only to imagine these miles of houses without the relief afforded by the gable, to give that welcome feature its just meed of praise. If we could detach one of these comparatively humble dwellings, and transplant it to its own little separate plot of ground, it would appear in much pleasanter guise than as a mere unit among a hundred counterparts. But as the conditions of civic life are compulsory, we may be thankful for the

ONE BREAK IN ARCHITECTURAL MONOTONY

that redeems so many suburban roads from absolute triviality and meanness. Unity of design is as apparent in the general features as in the minutest details. The very railings and knockers proclaim their relationship. But, glancing upwards, we experience a genuine sense of relief. The old style gave us almost constantly a horizontal sky-line, to the last degree flat and depressing. The new offers us a series of gables—naturally of various degrees of artistic merit—which, detaching themselves from the prevailing level, suggest a touch of personality, a kind of "way of their own," in the buildings which carry them. As we penetrate further into the country the gable begins to assume a greater air of freedom and spontaneity. The charm of the few manor-houses of the Tudor and Stuart periods which yet remain is, of course, greatly due to their innumerable associations, and to the venerable aspect which commands our unconscious homage. But the loss of their gables would be cruelly felt. They are by far the most striking and speaking features of the school of domestic Architecture to which they belong; and, on their picturesque side, we could as ill afford to dispense with them as to despoil the church of its spire, or the tower of its turret or pinnacles. To the eye contented with the quiet, but always refreshing, details of a typical English landscape, nothing, perhaps, makes such an irresistible appeal as the weather-beaten

GABLES OF THE HALF-TIMBERED COTTAGES,

which here and there seem to haunt valley and wayside, as if beseeching some sympathetic ear to listen to the stories they could tell. Than these old "homes of ancient peace," with all their narrow and tortuous and, to the modern sense, inconvenient interiors, scarcely any offspring of man's labour is at once so engagingly quaint and so humanly suggestive. Shakespeare was born in one of them, and so seems to be brought nearer to ourselves than if he had been cradled in castle or hall. Happily, the most modest modern cottage may yet command its gable. If it be only the crown of a rustic porch, it is still welcome, and invariably attractive. In the summer it smiles through its natural garniture of roses and woodbine, while it reserves a background of ivy for winter wear. And so, however insignificant its artistic value, the humblest gable makes a cheerful and friendly overture which few would willingly reject.

ARTS AND CRAFTS AT LIVERPOOL.

BY ERNEST RADFORD.

THE feature, so far as we are concerned with it, of the Spring Exhibition in Liverpool, is the work of the decorative artist, and it is necessary, if only that we may be brief, to exclude the Indian *Objets d'Art* which come from South Kensington; the photographs which, *per se*, may be excellent, and works other than decorative, as for instance, engravings and drawings which may or may not deserve praise. Thus then, have we planned a day's work: a circle within a circle is drawn, and even so there is scope enough.

A further and useful distinction is made in the place between works in the nature of trade advertisements, for which places are found because they are paid for, and others more purely artistic in spirit, and this being so, it need scarcely be said that the latter are more interesting. The members of the Hanging Committee have shown most excellent taste, and seldom, if ever, has an exhibition looked better.

No. 6, "Peony Surf," by Alexander Rottman, is a bold and effective design for a stencilled frieze which is well described by its name.

The products of the Kirkby-Lonsdale Potteries consort very well, without suggesting comparison, with those of the Della Robbia Co. The ware would appear to be generally harder in substance. The pieces are sea-green or slate-blue as to colour, and generally well-designed. Instance, No. 73 and its companion, by J. T. and Sidney Firth.

"A Fairy Plaque," white on a field of blue, designed by Miss M. Wood for the Della Robbia Pottery Co., is a beautiful little work, and is only one of a number in which the imitation, adaptation, or appropriation of the Italian's manner has been very successful. The Company in question is fortunate in having examples to show of Conrad Dressler's designs, for now it appears that he has a separate establishment.

A mantelpiece exhibited by Messrs. Longman and Co. has already been seen in London. Mr. Lethaby amongst others, has contributed, we believe, to the work. The furniture exhibited not remarkable from our point

PERFORATED BALCONY PANEL IN THE MUSICIANS' GALLERY, "PADDOCKHURST," SURREY.
CARVED IN SPANISH MAHOGANY. BY W. AUMONIER.

of view, though it may be good on all other accounts. Examples of mechanical ingenuity applied coldly to problems of design that are never very easily solved should always, we think, have a place, if only to impress on the young the necessity of docile submission to rule. In illustration of this remark may be noticed, in passing, a piece of embossed leather by J. Hammer Hutchings, which is as good of its kind as can be, and lacks nothing but the *je ne sais quoi* which converts proseurs into poets, and engineers into artists.

Mr. Nelson Dawson, when not engaged with his wife upon the exquisite allied art of enamelling, is generally employed upon works of tremendous strength, and may be fairly described as the Vulcan of these latter days. There could hardly be anything finer than his fireplace. It is intended, it seems, for some vast baronial hall, and, this being so the work in all parts is most carefully judged and proportioned. We ourselves have tested our strength on the poker and tongs, and

feeble indeed we appear. The forward and upright parts of the andirons are surmounted by apples most cunningly wrought, which present to the eye a polished surface, with sections of brass inlaid and in-beaten.

Mr. Rathbone's good work gains daily in grace, for having mastered his obdurate craft, he is able to devote more time to design, but always with careful regard for the thing which he has in hand. "To have and to hold" the conveyancer says, and the phrase is fairly expressive of the infinite pleasure there is, or should be, in acquiring for use a thing which is perfectly made. Let Art be defined as Love at work, and let this modest exhibition of things both useful and beautiful be at once admired and desired. Even if enough had not already been said in a general way, it would be time now to speak of particular things which appear to the writer to be more than ordinarily good of their kind, and this, in so small an exhibition, may be easily done.

Messrs. Rottman and Co. exhibit (No. 33)

LIVERPOOL ARTS AND CRAFTS EXHIBITION. "WHEATFIELD AND TREES." DESIGN FOR CRETONNE.

BY J. AND R. SILVER.

LIVERPOOL ARTS AND CRAFTS EXHIBITION. "PINE SHAPES." DESIGN FOR WALL PAPER. BY J. AND R. SILVER.

as a specimen of fibrous plaster, a bit of ceiling decoration, designed by J. and R. Silver, which is in itself beautiful, and being in low relief is peculiarly fit for its place.

If we are correctly informed, the "Children in the Garden of Joy," exhibited by Stirling Lee, are intended for the same house as Nelson Dawson's great fireplace. The work, "to be executed in oak," will form, when completed and placed, one of the most sumptuous pieces of ornament that modern England has seen. As we have not ascertained exactly where they will go in the building, it would not be safe to praise unreservedly, as we might be inclined to do. Suffice it to say for the present that they court comparison with Della Robbia's "Singing Boys," which, designed for the organ loft of the Duomo, are now on the walls of the Bargello in Florence. They are fortunate who are able to see them here, as they will be lost to sight in a private house. To a plaster medallion, by Miss Rope, No. 60, our attention was drawn by a competent judge of good work, and, as we agreed for once, the artist may safely be praised.

The later attempts of the Fitzroy Society to popularise Art are by no means always successful. The inanities of the stained glass designers are all right in their place. So long as the senses are gratified, we are fairly content. Hedged about as they are by convention, they cannot be expected to disport themselves freely, or to make a liberal allowance of life to God's creature; but with these same conventions the pictorial, as distinct from the decorative, artist has nothing to do. Our children, whose name is legion, cannot understand them, and it is not desired that they should. The most pleasing are, of course, the most natural. In these the attention is properly drawn to the abstract idea, as of a sower—rather than to the personal peculiarities of any particular son of the soil.

Perhaps because we have seen them before we have omitted to mention the carpets of M'Voysey's design. It would be difficult here to justly apportion the praise between him

and the firms that produce them, as the general effect is entirely delightful. By the same versatile artist are the papers exhibited by Messrs. Essex and Co., which may serve to give an idea of what can be done by this firm. They have not sent their best, however.

Mr. F. W. Pomeroy, sculptor, is here represented by one little "plaster relief," but, small as it is, it is beautiful.

No. 109, "a fire screen," in stained oak and coloured gesso, should not be passed without notice—the artist, Miss Agnes D. Bell.

Mr. Anning Bell, as a Liverpool man, contributes largely, of course. "A Mother and Child," No. 116, a plaster-coloured relief exhibited by the Della Robbia Company, is one of the best things he has here.

There are three or four rooms devoted to the productions of the different Art schools, which may, as a whole, be heartily praised. They cannot, however, be specified here.

In room No. VI are the architectural drawings. It will be understood that examples of Architecture chosen for reproduction must necessarily be very few, and that, perhaps, even these few are here because of a certain pictorial charm which they possess, and which does not as a rule belong to the ordinary scale drawing.

The actual cost of the barrages on the Nile at Assauon and Assiout, for the construction of which the Egyptian Government has just signed a contract in accordance with the scheme for creating a great Nile reservoir, will be £2,000,000. Inclusive of interest, the total sum to be paid will be £4,800,000.

A PAINTED memorial window, replacing the plain leaded glass, has lately been put in the chancel of St. John's Church, Great Horton, Bradford. The window is in one large light, and is divided by a canopy-base into two subjects. The general treatment of colour and design is in keeping with former work in the chancel. The window is from the studio of Mr. William Lazenby, Northgate, Bradford.

EGYPT, THE BIRTHPLACE OF ARCHITECTURE.*

By G. A. T. MIDDLETON, A.R.I.B.A.

(Continued from page 74.)

THE axial passage of the Hypostyle Hall of Karnac lies between two rows of columns, 60ft. high, resting on circular discs as bases, then swelling suddenly and afterwards tapering to a capital which is of bell form. The abacus above, instead of being a thin broad bearing slab as at Beni Hassan, is cubical and comparatively small.

This central passage is roofed with flat stones in the usual way at a high level, but on either side are several rows of lower columns, carrying a roof at a lower level, light being admitted to the central portion by a series of clerestory gratings or openings. The shorter columns very much resemble the reeded columns at Beni-Hassan, having a bud-shaped capital of exceedingly similar character; but they have a swelling, or entasis, as have the taller columns, and are circular, and not reeded, in section. This, however, is not a necessary peculiarity of the period, for reeded examples are to be seen at Luxor, though the entasis is always present, and the abaci are small cubes which do not appear to bring the weight at all well upon the capitals.

The ornamentation, it may be remarked, was generally painted, and not carved, during the Theban period, with the exception of the Symbolical Winged-globe, which appears in bold relief in the cavetto cornice over every doorway—and excepting, too, the hieroglyphic inscriptions and representations of scenes from every-day life which are commonly found incised upon the wall surfaces. It seems that the ornamentation of the columns generally took the form of representations of reeds, and leaves, and binding straw bands, as if the column had originated in bundles of reeds or posts, and not in large tree trunks or in monolithic quarry supports.

Contemporaneous with the temple at Karnac, and undoubtedly of the time of Rameses II., is the Ramesseum. It again exhibits the same characteristics of arrangement as does the temple of Medinet Habou, erected by Rameses III., the first king of the 20th Dynasty, about 1200 B.C. So exceedingly conservative were the Egyptians in their religious rites, as well as in their general mode of living, the son always adopting the father's trade and working according to his rules and methods, that even in the three hundred years of the Theban period of Architecture little variety is to be found. Even in the later examples, as at Medinet Habou—and, of course, it will be understood that there are many smaller monuments which are not mentioned here—there is but slight change noticeable. There is the same extreme vigour and imposing strength, but sculptured figures are now more often found in front of and even attached to the square supporting columns of some of the colonnades and halls. The sculptor's art had reached a high state of perfection at a very early date, but its productions do not appear to have been directly connected with the buildings till somewhat later, and then gradually more and more. Still, it was at all times most architectural in character, harmonising in its massive solemnity in a most wonderful manner with the tombs and temples. Following strict laws of proportion and posing, it may be called conventional portraiture of the highest order; and so little variety of method is to be noticed that it is exceedingly difficult to understand the great distance of time between the erection of the great Sphynx, which, close to the Pyramid of Cheops, is by many authorities contemporaneously dated, and the well-known portraits of Rameses II.

Obelisks, too, were during the Theban period, frequently used as architectural features, being erected in pairs, as at Karnac, outside the entrance doors and pylons.

* A paper read before the Society of Architects on Thursday, February 24th, 1898.

Besides the erected temples, some few were excavated in the rock during the 18th and 19th Dynasties, the most important being that at Abu Simbel (Ipsamboul), of the time of Rameses II., and that at Mount Barkal, the date of which is more difficult to determine. The simplicity of arrangement noticeable at Beni-Hassan is no longer preserved, that of the axial passage way being followed, with every other detail of the open air temples, so far as was possible under the changed conditions; save that at Abu Simbel side chambers are to be found, as if they were subsequent excavations.

It was only the inner portion of the temple of Mount Barkal, however, which was excavated, the two outer courts or halls having been built against the face of the walls; and a glance will show how crude were the figure sculptures attached to the square columns flanking the axial passage. At Abu Simbel it was different. All there was rock-cut, and the entrance was made as nearly as possible to represent a magnificent pylon, with four colossal seated figures attached to and excavated out of the face of the rock. Inside, in the Entrance Hall (representing the colonnaded open court of the erected temples) are two rows of huge standing figures, certainly much smaller than the external statues, but still 60ft. high each, which appear to carry the roof, but which are, in fact, quite clear of it, looking straight in front of them, as all Egyptian statues do, apparently ignoring poor, feeble, pigmy man, with his short existence of three score years and ten.

Wonderful and noble edifices are these temples of the Theban Dynasties of Egypt; and a small point of additional marvel has recently been brought to light and announced by Professor Goodyear, in the Architectural Record of New York, in the fact that the courtyards of Luxor, Karnac, and Medinet Habou—and also that at Edfou, to be mentioned presently—are not quite square, the cornice lines at least being always somewhat curved convex to a spectator standing within the court, the curve being sufficiently subtle to be unnoticeable from below, but yet inducing an appearance of greater dimensions to the court than those which actually exist.

After the death of Rameses III.—with whom, it will be remembered the 20th Dynasty opened—the prosperity of Egypt rapidly declined, and at the close of the Dynasty in 1100 B.C., the state of the country was not much better than it had been when the shepherd kings (Hyksos) were in possession. The natural result followed, and all building of importance ceased, the Art of Architecture only reviving with the later prosperity under the Ptolemies, even though there was comparative peace during the 26th Dynasty, from B.C. 666 to B.C. 528. It was with the conquest of Egypt by Alexander the Great, in B.C. 332, and with the accession of his general Ptolemy, that building really recommenced, and, strange to say, upon almost precisely the same lines as a thousand years before. Throughout the length of Egypt the old temples were restored, and new ones built in a style which imitated and almost equalled that of the Theban period. Everything upon the island of Philae belongs to this time, the worship of Isis commencing there in 286 B.C., and the worship of Osiris being continued until 453 A.D.; and the greatest of the other erections were the temples at Denderah, 200 B.C.; Edfou, 237 B.C. to 57 B.C.; and Kom-Ombo. Even a casual glance at the plan of Denderah shows how similar it is to the temples of the 19th dynasty. There is the inner sanctuary, then the pillared hall, and then the open court, with its pylon entrance, all arranged about an axial passage. The differences are those of proportion and detail rather than of general effect. There is a certain loss of massiveness and dignity, compensated by greater elegance, especially in the small single-cell temples, such as that commonly known as Pharaoh's Bed upon the island of Philae—a delicate little gem. Like much of the work of this period, it depends largely for its effect upon its carving, for the ornamentation which a thousand years previously had been painted upon the buildings was

now carved, and it was in the capitals of the columns that the change was most marked. The bud form has by this time gone out of use, but the bell is enriched with foliage lavishly applied. As a rule fern and other leaves are represented rising above the binding straws, still present as binding together the reeds of which the columns were supposed to be built up. Often they assume most graceful forms, and the Corinthian capital of the Greeks is frequently found closely followed in general scheme. A strange point to be noticed is the retention of the axial arrangement even in these ornamental capitals, those nearest to the axis on either side being alike and no others, or, in flanking colonnades, the first on the right of the axis being similar to the first on the left, the second to the second, and so on.

Another form of capital which was now in common use was square, with the mask of a female head carved upon each face; while the abaci above the capitals were also carved in representation of small pylons. The columns, too, no longer rest upon circular discs as bases, but upon a continuous step, or stylobate, and, more than this, they are joined to one another, save at main axial openings, by a dwarf wall reaching up to about one-third of their height. This wall has a small cavetto cornice, like those to the main colonnades, the doorways, and the pylons, frequently ornamented with simple vertically rising leaves.

These comparatively slight differences are all that distinguish Ptolemaic from Theban work, yet they are sufficient to enable a judgment to be pronounced at once as to which period any particular building belongs.

Thus it will be seen that there are four great Egyptian building periods, with gaps of time between, the styles of the first and second being distinct, and of the third and fourth almost identical, in spite of an interval of nearly a thousand years between them.

The death is announced of Mr. William Spooner Till, who for nearly forty years filled the office of city surveyor of Birmingham.

EXPANDED METAL.*

ITS RELATION TO FIREPROOF CONSTRUCTION.

By J. F. GOLDING.

THE structural novelty of expanded metal has never failed to attract and interest all those who have seen it. It is metal distributed in that latticed form which never goes out of fashion, and it can be applied to almost every purpose for which open metal work is at present used. It is about nine years since expanded metal was first produced in commercial quantities, and then with considerable difficulty, as a machine had only recently been invented which would operate on the metal so as to simultaneously cut and open it. The perfecting of the details of this machine had still to be invented, and the knowledge of suitable metals for cutting and expanding had to be acquired. It was then an entirely new article, manufactured by a method necessarily peculiar to itself, and with an untried field for its employment. It is not surprising therefore that considerable money and energy were misdirected in the endeavour to vitalise it. There was, however, a serious limitation to the use of the products from this machine, owing to the fact that they could not be expanded from plates above one-sixteenth of an inch in thickness, so that on account of this, and the imperfections of manufacture, the use of the metal was restricted almost wholly to lathing for plastering. The necessity for heavier metals and for greater accuracy in cutting was therefore ever apparent, and the result was the addition of another member to the family of expanded metal inventions in the form of a machine which operates alike upon the thinnest or thickest metals required, and with great precision. Before detailing

SOME OF THE USES

to which expanded metal can be applied, it will be, perhaps, best to draw some comparisons

*A paper read before the Civil and Mechanical Engineers' Society.

THE LIVERPOOL ARTS AND CRAFTS EXHIBITION. ROMANO BRITISH MOSAIC. "HEAD OF POMONA." FROM A PAVING IN THE MUSEUM AT CIRENCESTER. BY ARTHUR T. BOLTON.

between the methods and manufactures of the old expanded metal and the new, which will assist in making clear the reason why the old metal was not more generally applied for exposed uses. The old metal was limited to thin sheets because the construction of the machine necessitated peculiar cutters which would not stand the strain required for heavy metals. The new machine is the embodiment of simplicity and strength in all its parts, and is only a large shearing machine having one lower stationary blade of the required length (say 8ft.) and a top blade, or series of blades with corrugation, representing half the sizes and forms of the meshes longitudinally, also means for feeding the metal forward to the cutters and shifting it sideways between every stroke. The old machines each produced but one size of mesh of width of strand, and were limited in practice to sheets of, say, 4ft. in width. The new machines are individually capable of producing any size mesh by simply changing the upper corrugated cutters, and the width of the strands may be increased or diminished while the machine is in action. The old machine slit and opened the metal, giving much the same effect as if it was first slit and afterwards drawn open, which naturally caused the metal to shorten in length as it was opened or expanded in width, this shortening being about ten per cent. The new machine produces the expansion by stretching the strands as they are cut away from the plate, and consequently the finished article is of the same length as the original strip of metal, while it is increased from twice to twelve, or even more, times in width; that is to say, a sheet of steel 8ft. long by 6in. wide can become a sheet of expanded metal 8ft. long by 6ft. wide, or more. In the old machine motion was given to both the upper and lower cutters, both sets consisting of single cutters stacked alongside each other to the full length of the machine, and in this double movement the cutters had an almost uncontrollable action upon the metal, with the effect of distorting the produce both in respect to the shape of the strands and of the finished sheet. The effect of the new machines is perfect alignment of cutting as to strands, and perfect squareness and regularity of the finished sheet throughout. There is, therefore, besides, the

ALMOST LIMITLESS CAPABILITIES

of the new machines as to variety of products, great economy over the old, both as to cost of construction and operating charges, and as to the quantity of metal plate required to extend over a given area. The patented processes and machines leading up to the present perfected system of manufacture are unique innovations from the routine of mechanical discoveries, and have been surprises even to engineers engaged in avocations most nearly associated in kind, so that I would ask you to pardon me if I feel some pride in the fact that there is sufficient similarity between all features of these various developments to establish them as my own offspring. Until quite recent years the order of buildings, wherein expanded metal is now largely employed, were provided with floors of wood joists, and wood stud partitions, and wood lathing. This was dictated by the very obvious reason that the laths are but faggots with only an under surface of plaster to protect them from fire, and are left free above, to communicate flames one to another, thus forming a fire trail to both sides of the wood joists supporting the floors and ceilings. The marked change towards the further elimination of woodwork from buildings and the substitution of all iron columns, girders, joists, etc., is shown by the fact that more than 15 per cent. of the expanded metal lathing used prior to, say, five years ago, was for application to wooden joists, studs, etc., the balance of per cent. being in combination with other iron work about the buildings, whereas at the present date these figures are reversed in nearly equal proportions. The expanded metal lathing now not only serves to encase the main girders and columns, but also to form suspended ceilings under what were once termed fireproof floors, consisting of rolled girders with concrete fillings between them,

also for forming double or solid partition walls. The importance of protecting exposed iron works from the direct contact of flames has become so apparent that new structures without these provisions are rarely to be met with. In fact, there is a general disposition to cover these in the older buildings, and the stimulus to this is noticeable immediately following the recurrence of great fires, such as the Cripple Gate conflagration. The advantages possessed by

EXPANDED METAL LATHING,

rendering it so largely useful as a building material in combination with plasters, are that it is fire-resisting, manufactured in form convenient and economical for application, being in flat sheets and requiring no stretching, has the maximum uniform key, and is buried within the plaster. The first proposition, *i.e.*, fire-resisting, needs no sustaining; but the question is asked: "Will it not expand under considerable heat to disturb the plaster?" This has been answered in the negative by many tests, and the reason is that the sheet steel from which it is made no longer presents the same rigid plane for expansion or buckling, but that it has been slit into numerous strands of small section, and these reticulated to such a manner as to permit each of such strands to expand, thus reducing its effect to an infinitesimal quantity, and this is compensated for by the yielding nature of the plaster. The first form of sheet metal lathing with which I became familiar consisted of corrugated and perforated sheet-iron. Sheets of such lathing, when used externally on buildings exposed to intense sun heat, continue to expand and contract, and it has been found impossible to keep it covered with cement mortar. Instances like these prove that for metal purposes the less there is of the original sheet left in its flat and corrugated form the better. The second proposition asserts its convenience in form for application, and this will be understood when it is known that it can be produced in flat sheets up to 8ft. in length, and in width of from a few inches to several feet; in fact, wide enough to encase the largest girder or column if desired. In one direction the material is sufficiently rigid to span a considerable space without other support, and yet sufficiently yielding to form self-supporting corners, etc., while in the other direction it is readily bent and retains itself at any desired angle. The third proposition asserts superior keying qualities for plaster. The strands forming the meshes lie at an angle of nearly 45 degrees to the plane of the sheet of lathing, so that if the plaster only filled the sheet equal to its thickness it could not be removed except at the angle of the strands without it was first broken up. The key, however, in practice will be seen to pass through the meshes, and overlap the strands, effectually burying the lathing in the mortar, and thus preserving it from exposure and oxidation.

PARTITION WALLS.

The second development of expanded metal in structural work was the formation of solid partition walls, and the present system of erecting them was due to two suggestions, one to an inquiry as to the use of the metal without supports while imposing the plaster, and the other a criticism on the use of angle iron studs to carry the lathing. The first inquiry was in the interest of economy, while the criticism was, that the angle irons, being of stiff section, must, under heat, expand and distort or destroy the partition. As a result, we have a near approach to meeting to both these suggestions, *viz.*, the taut wire studs, into which the lathing is interlaced and covered with plaster to a thickness of 1½ in. or 2 in. These are economical, both as to first cost and in saving of floor space, and are as fireproof as the nature of the cement plaster permits. The item of saving of space is of very considerable importance in large cities, especially in sub-dividing offices, in forming stair and lift shaft casings. This invention germinated in England, and was taken up with great avidity in the United States, and is employed in many of the largest modern

buildings, the area of such partitions erected annually probably extending a million super yards. They may be built within any existing building and at any point without other foundation than the flooring, as they are comparatively light, and when set hard become a monolithic slab, equally distributing their weight. The advantages of this feature over segmentary constructions will be readily understood. They are surprisingly sound proof, as has been witnessed by many tests at London.

FLOORS.

The third development of the use of expanded metal in fireproof building construction relates to its use as a tensile bond in concrete floors. This was also a very natural adaptation of the metal, because of its manifest and surprising supporting strength. This stiffness is due to the fact that the strands are set edgewise to the plane of the sheet of expanded metal, their combined width representing the width of the original sheet from which it is made. Thus, a sheet of expanded metal of 3in. mesh and ½ in. wide strands represents a strip of steel 6in. wide set upon edge. The carrying capacity of the 3in. metal, it is true, is not so great as the 6in. width uncut would be standing edgewise, for the reason that in the expanded form the strands do not set vertically, but, as in the lathing, approaching 45deg. from the plane of the sheet. But, as these are supported in their lattice-like position one by the other, their carrying power is many times that of the original sheet when laid flatwise, and tried as a beam. This metal of varying meshes and weights is used for the manufacturing of flooring, paving slabs, lintels, &c., but most commonly for the making of concrete floors *in situ*. This is done by laying the expanded metal loosely upon the ordinary centering, so that it will reach from girder to girder, or wall to wall, as the case may be, and imposing the concrete upon it. It is not possible in practice to either have the centering on the expanded metal so exactly flat, but that with the weight of the workmen treading upon the sheet in the act of imposing the concrete will cause it first to slightly rise up at some point, thus permitting the concrete to pass under the metal, and which prevents it again from returning to the centering, and as they tread again at the other points, the metal will be found to have taken its place wholly within the concrete, so that when the centering is removed the metal is not visible but is in the best position as a tensile member and bond to the concrete. No. 8 expanded metal, which is the 3in. mesh, ½ × ½ strands, made up in a slab of concrete 6ft. 8in. long × 2in. wide × 3in. thick, has been proved to increase the strength of the slab more than tenfold (see page 2 of Messrs. Fowler and Baker's report). All the tests made by this eminent firm of engineers gave this as about the average result. The utility of this metal in concrete as against rods placed at right angles, as is done in the Monier system, is evident when we take into consideration the fact that the expanded metal is a continuous solid connected

WEB WORK WITHIN THE CONCRETE,

and that weight imposed at any one part distributes the strain over a larger area than it is possible for disjointed rods to convey. And, besides, a large sheet of expanded metal, say a square of 8ft., is laid in a few seconds, whereas considerable care is required in placing rods a given distance apart in either direction, and especially so if they require to be tied at the intersections. There are several systems of concrete flooring to which expanded metal has been adapted, *viz.*: first, a continuous slab lying above girder or wall supports; second, the metal placed between rolled iron joists, and resting upon their lower flanges. This latter practice may be done *in situ* or by casting the slab and placing them between the joists as they are laid. If cast *in situ*, a strip of the lathing mesh, somewhat wider than the joists, may be laid beneath and longitudinally with them, so that the concrete passing through the larger mesh with it, and thus providing a surface to receive plaster beneath the joists when the centering is removed. It has been

extensively used in concrete arches. In some cases the metal lying immediately upon the arched form of centering; and in other cases, as at Kennet Wharf, London, E.C., the arched centering was filled with concrete to slightly above the crown of the arch, when the expanded metal was laid flat from girder to girder, and the filling in of concrete continued as described. As before stated, there is no single system of floor which seems to lend itself to all requirements, and this particular floor (generally described as the channel arch system) has proven to be most economical where spanning of considerable distance is necessary. Its special advantages are that it produces an exceedingly rigid floor with a minimum amount of material, and its consequent lightness. The flooring may finish up either with or without a suspended flat ceiling or with a dome ceiling. There is no limitation upon the span of flooring or roofing to be

CEMENT ADMIXTURES.

FOR the past three years, investigations into the question of cement admixtures, have been made by the Cement Trade Section of the London Chamber of Commerce. They instructed Messrs. Stanger and Blount, of Broadway, Westminster, to make extensive experiments with mixtures of Kentish ragstone with Portland cement, and also obtained valuable evidence from Mr. D. B. Butler, Mr. Gilbert Redgrave, Mr. H. K. Bamber, and Dr. Michaelis of Berlin, and others. After full consideration the Section adopted the following resolution:—"That Portland cement be defined as a mixture of two or more suitable materials intimately and artificially

MIXED IN THE REQUISITE PROPORTIONS, and afterwards properly calcined and ground, to which nothing has been added during or

for minor effects, caused by the slight slaking action of moisture commonly present in ordinary ragstone, the part played by ragstone mixed with cement is purely mechanical. The product obtained from the two materials is merely a mechanical mixture, and is in no sense a chemical combination. In our opinion such a mixture cannot correctly be termed Portland cement.

GYPSUM ADDED TO CEMENT

for the purpose of regulating the setting time, in quantities not exceeding 2 per cent. of the weight of the cement, has no deleterious influence on the quality of the cement." With respect to other materials, Messrs. Stanger and Blount say that they are unable to give a general opinion as to their influence on cement when mixed with it, and that they would have to report separately as to each after long and careful investigation; and they express a

BYFLEET VILLAGE HALL COMPETITION. DESIGN BY CHARLES E. VARDELL.

obtained by this system within the average requirements for buildings. One of the first works carried out on this plan was a reservoir roof, having a clear span of 60ft., as is indicated on water reservoir litho plate. In this instance the arches were about 8ft. deep at walls on the apex of the roof, some 6ft. above the walls, giving a rise of about 14ft. The channel supports were 7ft. apart, and the thickness of the concrete between channel supports, including the finish, about 3in. These floors of 12ft. spans, the channels at 4ft. centres with 12in. rise with 3in. thickness of the flat concrete, had been loaded with 17cwt. per super foot, and variously otherwise tested, until their strength and utility has been fully established. I trust if I have not succeeded in conveying anything specially new, still that I may hope to have awakened such interest in the matter as will enable those of an inventive turn of mind to improve upon the methods of using expanded metal.

THE Hornsey District Council has now made arrangements to complete the purchase of Churchyard Bottom Wood for the sum of £25,000, the whole amount having now been received. The acquisition of the wood has taken nearly two years to accomplish.

after calcination, excepting that an addition not exceeding 2 per cent. of gypsum is permissible for the purpose of regulating the setting." That the following rule be adopted:—"That if any material whatever, excepting 2 per cent. of gypsum, for the purpose of regulating the setting be added to the Portland cement clinker during or after calcination, the article so produced shall not be sold as Portland cement, but under some other distinctive name." The above resolution was based upon the evidence of various experts, which cannot be better summed up than in the following conclusions of Messrs. Stanger and Blount:—"Ragstone is a natural form of calcium carbonate mixed with siliceous matter. It is an inert substance incapable of setting when gauged with water. Ragstone, when mixed with Portland cement, undergoes no chemical change, and does not combine with cement either in the dry state or when the mixture is gauged with water. Mixtures of ragstone and cement have a specific gravity lower than that of unmixed cement, and indeed correspond closely in specific gravity with that calculated from the respective specific gravities of the two materials. The specific gravity of normal ragstone may be taken as 2.70, and that of normal cement as 2.15, so that the difference between them is substantial. Save

strong opinion, in conclusion, that whatever be the effects, whether good or bad, of the admixture of any material whatever with Portland cement clinker after calcination, the article so produced cannot legitimately be termed Portland cement. Each of the other experts examined endorsed this view, and the Section approve and adopt it.

THE memorial stones of new club premises at Hebden Bridge have been laid. The architect, Mr. Jesse Horsfall, Todmorden, has adopted the style of English Renaissance.

THE latest suburban theatre is at Dalston, and will open early next autumn. The theatre is the first built on the plans of Sir Henry Irving's "safety" theatre. The architects are Messrs. Wylson and Long.

THE new swing bridge across Leith Harbour has been opened for traffic. Sir William G. Armstrong, Mitchell, and Co. were the contractors for the bridge, which has taken eight months to complete, and has cost £8000.

FUNDS are being raised for the completion of the fabric of Christ Church, Moldgreen, Huddersfield. The church is without chancel and vestries. Plans of the desired extensions have been prepared by Mr. G. F. Bodley, consulting architect for York Minster.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

March 9th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slates; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, could, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

We understand that Mr. J. F. Micklethwaite, F.S.A., of Westminster, has been appointed surveyor of Westminster Abbey.

THE whole of the plans prepared by the six selected architects in competition for the new lunatic asylum which the Birmingham Corporation propose to erect at Holly Moor, near Rubery, have been deposited at the Council House. The names of the competing architects are Messrs. Cossins, Peacock, and Bewlay, Colmore Row; Messrs. Mansell and Sons, Colmore Row; Messrs. Ingall and Sons, Temple Row West; Messrs. Cross, Brooks, and Nicholls, Temple Row; Mr. Frank B. Osborne, Bennett's Hill; and Messrs. Martin and Chamberlain, Colmore Row. Before making a final selection the Asylums Committee will take the advice of Mr. G. T. Hine, of Parliament Street, London, the consulting architect to the Commissioners in Lunacy.

THE Estate and Burial Grounds Committee of the Leicester Town Council have reported that, as authorised by the Council of October 27th, 1896, they invited designs from the local architects for laying out the proposed new cemetery on the Gilroes Estate. Three sets of designs were sent in, and the committee appointed Mr. John Belcher, of 20, Hanover Square, London, to act as professional adviser, and the committee awarded the premiums in accordance with Mr. Belcher's report, as follows:—First, £50, Messrs. Goddard and Co.; second, £30, Mr. Stockdale Harrison; third, £20, Mr. Charles Kempson. The designs of Messrs. Goddard and Co. have since been carefully considered by the architects in conjunction with a sub-committee, and certain modifications have been made. The committee recommend that the plans of Messrs. Goddard and Co. be adopted, omitting for the present certain specified work. The original estimate of Messrs. Goddard was £27,573, but the revision of the plans and the omission of work reduces the estimate to £20,797, to which must be added: Sexton's lodge at Groby Road entrance, with office, committee-room, &c., attached, £800; architect's commission, £1080; clerk of works' salary, £300; total, £22,977. There is also the following work which was excluded from that to be provided for by the architects, viz.: Belt of trees surrounding the cemetery, £1500; fences not otherwise provided, £1600; making a total estimate of £26,077.

At the third meeting of the newly-formed Commercial Section of the British Fire Pre-

vention Committee the question of independent tests with fire-resisting materials was dealt with from the manufacturer's aspect. The sixty firms associated with the section were strongly represented, and Mr. Farrow, F.R.I.B.A., the new chairman of the section, presided, supported by Mr. Edwin O. Sachs for the executive. After considerable discussion, various resolutions were passed expressing the desirability of arranging reliable independent tests in such a manner that would in every way merit the confidence of the general public and of the professions interested. Some of the principles as to the manner of arranging the tests, the construction of testing stations, &c., were also formulated for the consideration of the executive. With these resolutions expressing the support of the Commercial Section as regards independent testing, the execution of this scheme is practically decided, and it now only remains with the executive to make workable arrangements of a thoroughly scientific but practical character. One of the most important pieces of work on the committee's programme has thus been inaugurated, and London will at last have a centre where reliable information regarding fire-resisting construction will be easily obtainable. New York and Hamburg, it will be remembered, have already had some similar tests, but on a smaller scale than here intended.

THE exhibition which has been got together at the City Art Gallery at Leeds as the attraction for this spring is hardly so strong as some of its predecessors. Whilst there is an abundance of respectably painted and more than respectably painted canvas, pictures of real mark and distinction are not very easy to find. These vicissitudes are, of course, unavoidable, and some other year no doubt, without any greater effort on their part, the committee will find themselves able to grace their collection with a few conspicuously fine works. In the present exhibition there is plenty to interest and afford pleasure, and several hours may be spent pleasantly and profitably in making the tour of the different rooms. Among the artists who contribute are Mr. J. MacWhirter, R.A., Mr. Colin Hunter, A.R.A., Mr. David Murray, A.R.A., Mr. J. M. Swan, A.R.A., Mr. J. Aumonier, R.I., Mr. Alfred East, R.I., Sir Wyke Bayliss, P.R.B.A., Mr. Ernest Normand, and Mr. G. P. Jacob-Hood.

THE inhabitants of the city of Auckland and its surrounding districts in New Zealand, having decided to erect a statue of the Queen in commemoration of the sixtieth year of Her Majesty's reign, the Committee appointed to make the necessary arrangements obtained, through the Agent-General for New Zealand in London, several designs from some of the leading sculptors, and it has now been decided to accept the offer made by Mr. F. J. Williamson, of Esher, to supply a replica in bronze of the statue which now stands in the hall of the Royal College of Physicians and Surgeons on the Thames Embankment. This statue is 7ft. 6in. in height, and the base measures 2ft. 10in. by 2ft. 8in., and it will be erected on some one of the beautiful sites so well adapted for the purpose which are to be found in the city of Auckland.

THE Shakespeare Memorial at Stratford-on-Avon has just been presented with a fine stage portrait in oils of the late Mrs. Stirling, painted by Anna Lea Merritt in 1884, eleven years before the actress's death. She is represented in the character of the nurse in "Romeo and Juliet," and the likeness is a very good one. Lady Gregory, better known as Mrs. Stirling, acted in the Shakespeare performance at Covent Garden in aid of the fund to purchase the birthplace in 1847, and made her last appearance on the stage she had ornamented for half a century in 1886. There is already a likeness of her in the gallery in another of her great impersonations, that of Peg Woffington in "Masks and Faces." The present portrait was bequeathed to the Memorial by Sir Charles Hutton Gregory, K.C.M.G. Another recent donation to the gallery is a

portrait of the late Mr. H. Graves, the well-known art connoisseur, whose fine collection of Shakespeare pictures was presented to the Stratford Gallery at his death. His portrait is destined to hang by that of Ellen Terry, presented by the actress herself a few weeks ago when she was in Stratford, and it is the gift of his son, Mr. Algernon Graves, F.S.A. Mr. Graves was one of the first governors of the Memorial. In anticipation of the April performances, new seats have been put in the theatre of a comfortable character, and the lighting on the other side of the curtain has been improved, while the accommodation has been added to by the construction of a store room for properties under the pit.

WRITING to the Daily News, Mr. G. Hawley says:—"The historical landmarks of the country should be watched with jealous eyes when under process of so-called restoration. I passed through St. Albans recently and saw that the Abbey was again under course of repair, and by the same hand as replaced a perpendicular window in the transept with a glaring wheel one. This time it is the tower (to judge by the previous work of the architect) that is doomed to change. Before that it was the tower of St. Michael's Church that was reconstructed on an entirely different design. Now, here is the case. St. Albans as a city is apparently not rich enough to undertake the work, so a rich amateur steps in—with the above result. Now, are there no men of deep architectural knowledge who can give us an opinion as to the necessity for changing such important buildings—they are landmarks of English history—or for them to be done privately? The case of the tower of St. Albans Abbey is a matter for swift action. The battlements on the west side are already being stripped."

THERE seems at last to be a definite intention in official circles to undertake the rehousing of the National collections in a proper way. A Bill is shortly to be introduced to make the necessary financial arrangements for the work that has to be done, and unless any unforeseen accident occurs to delay the progress of this measure, we may fairly hope to see before long an improvement in the none too creditable condition of affairs at South Kensington and elsewhere. There is a great deal to be done, and it is to be hoped that the work when once undertaken will be carried through with all possible speed. It is not, perhaps, a good augury that there should be so little progress to record with regard to the rebuilding of that inconvenient exhibition place, Hertford House. At least another eighteen months must elapse before the Wallace Collection is made accessible to the many people who want to see it.

ONE of the best possible signs of growth in the influence which artists exercise upon public taste is given by the anxiety of the managers of the leading theatres to secure the help of prominent painters in productions that present scenic opportunities. Recently Mr. Alma Tadema rendered valuable assistance with the scenery and costumes of "Julius Caesar" at Her Majesty's Theatre, and now at the St. James's Theatre the scenery and dresses of "Much Ado About Nothing" owe much of their excellent effect to the co-operation of Mr. Arthur Melville and Mr. Graham Robertson. It is a matter of no little importance that such influences should be encouraged, for our theatres have too long adhered to obsolete spectacular conventions, which are often opposed to true pictorial effect.

THE seventy-second exhibition of the Royal Scottish Academy has been opened in Edinburgh. The exhibition this year is of good average merit, though neither by the members nor associates nor by outsiders are there any works of what might be termed sensational interest. As usual, the Council has obtained on loan a few pictures by contemporary artists. These include a work of great accomplishment and beauty by M. Munkacsy, the Hungarian-French artist, called "My Mother's Old Song," which has been lent by Mr. J. M. Fraser, Rosemount, Perth; and from the same collection

has been obtained a picture by M. Bouguereau, entitled "Mischief," which can hardly be regarded as an important example of the art of this well-known French painter. The subject smacks too much of the print-shops of the Rue de Rivoli. Three pictures by Mr. Orchardson have also been received on loan, viz., the portrait of Sir David Stewart, Aberdeen, and the portraits of Mr. and Mrs. James Tullis, Glasgow. The last-mentioned, in primrose tints, was at the Royal Academy last year. The President, Sir George Reid, is represented by two portraits painted in his virile and trenchant style. They are of Professor Davidson, of the Free Church College, Edinburgh, and of Mr. W. Carnie. The beautiful portrait by Mr. Lavery of Miss Mary Burrell, Glasgow, which was so much admired both at Burlington House and at the Salon Champ de Mars, has now reached Scotland, where it will greatly raise the artist's reputation; and from the hand of Mr. James Guthrie there are three portraits of great merit.

The further details of Mr. Middleton's sketching tour to the Hartz district of Germany at Easter, which are now before us, show that all possible arrangements have been made in advance to secure smooth working, and the saving of time. This is of great importance, for with everything ready mapped out, earnest students can go straight to work, without being bothered by the thousand and one hindrances of independent travel. Leaving London on the night of April 6th, the party will travel to Harwich, meeting there the contingents joining from York and Manchester, and will travel by the comfortable boats of the G.E.R., in which the sleeping accommodation is all that could be desired, to the Hook of Holland. All the next day will necessarily be devoted to a railway journey through Holland and Germany, passing through many interesting towns *en route*, reaching Hanover in time for a late dinner. As Hanover is a comparatively modern town—though it contains some old brick houses of the fifteenth and sixteenth centuries, a Gothic Rathbans, and two fine brick churches—only one day is to be given to it, in order that more time may be devoted to Brunswick, the next town visited, with its magnificent cathedral, its many churches, and its well-known Cloth Hall and Weigh House. Of the other three towns, Halberstadt, Goslar, and Hildesheim, it need only be mentioned that they are situated in the midst of the Hartz district, and are as picturesque and interesting in themselves as is the country round.

The south side of the new wall of Westminster Hall is already decaying, and Earl Stanhope is pressing the Government to take early steps to repair it, which may cost a considerable sum. Yet the old building itself, which dates from the Norman Conquest, is still in first-class order and needs no expenditure.

The Royal Institute of British Architects is engaged, as the English representative of the trustees of the Phebe A. Hearst Fund, in distributing prospectuses and ground plans for a world-wide competition in which English architects are particularly interested. The buildings and their arrangements, for plans of which premiums amounting to £10,000 are offered, are to comprise San Francisco Bay, with a magnificent view of the Golden Gate. Some idea of the magnitude of the project is gained when it is said that the buildings, when completed, will form a pile over thirty times the size of Somerset House, and that the space to be disposed of to the best advantage by the genius the trustees hope to develop through the competition, is a strip of sloping land over a mile in length and half a mile in width at the widest part, covered in places with charming groves and having near one of its edges a pretty watercourse. The programme points out the necessities of twenty-eight groups of departments, but leaves competitors free to concentrate or distribute, to study new dispositions, and to suggest—either in writing or by means of drawings—any new ideas that they may have perfected. In the general

observations attention is particularly called to the opportunities for planning a group of beautiful edifices by the statement that no limitations are placed in the materials to be used, and that California abounds in beautiful and durable building-stones.

ALL the plans must be in the hands of the United States Consul at Antwerp before July 1, when they will be submitted to an international jury. There are to be two competitions, a preliminary and a final. The final competition will be between the authors of the ten to fifteen best plans selected at the preliminary competition, members of the jury for which are: Mr. R. Norman Shaw, R.A., London; Mons. J. L. Pascal, Paris; Mr. Paul Wallot, Dresden; Mr. Walter Cook, New York; and Mr. J. R. Reinsteine, San Francisco. If only ten plans are retained, £300 will be paid to the author of each of them; if fifteen are accepted for the final competition, £250 each will be paid; if more than fifteen, not less than £200 each. Competitors successful in the preliminary competition wishing to journey to San Francisco to study the site of the proposed buildings on the ground will be paid first-class return fares to California, and will have six clear months in which to send in their amended plans. A sum of £4000 will be devoted to premiums for the best plans, £1600 of which amount will be awarded the plan classed as No. 1. The buildings of the new University of California will finally be erected in sections made up of the best of the different prize-winning plans submitted.

MORECAMBE means to stand on its dignity rather more firmly than of yore. It has rejected plans for a new police station which the Lancashire County Council propose to set up, at a cost of £7000. The fact that the plans have been approved by the Home Office, the Local Government Board, and the County Council does not count. The Morecambe District Council has ideas of its own on the subject, and can at least express them. The Council has also rejected a proposed revolving tower, which was to adorn the Marine Road, having discovered that it would be certainly ugly and probably dangerous. Lastly the Council turned up its nose at the suggestion of a refuse destructor, because it might create a smell in a rapidly improving neighbourhood. They passed the destructor after all, it is true; but the simple circumstance that Morecambe has already advanced to the point at which ugliness and smells are objected to, is little short of marvellous, as an æsthetic development.

A MEETING of the Liskeard Vestry was recently held to again consider the subject of the condition of the church tower. On behalf of the Tower Committee, Mr. S. Bone said they had taken counsel's opinion, which was that having regard to the fact that there were no funds available to restore the tower, and that the Chancellor did not well seem to grasp that the tower had become dangerous, the vicar and churchwardens should lay the case before the Chancellor again. In accordance with that, the churchwardens wrote the Chancellor, pointing out that the mischief was still increasing; that the tower must inevitably fall, and was dangerous to life; whilst it was absolutely certain that should it collapse, great damage would be done to the church itself, whilst the tower would be totally destroyed. In reply, the Chancellor asked whether the parishioners were favourable to the proposed application for a new faculty, and whether funds would be forthcoming to rebuild the tower. The required answer was given, and the Chancellor wrote that he would be prepared to grant a faculty to take down and rebuild the tower as it now stood with one stage not more than 15ft. added to its height and a vestry, the Norman arch of the tower to be preserved. Probably the best course, the Chancellor advised, would be to withdraw the present petition and all proceedings, and then to file a faculty to carry out the work in the way proposed. Taking into consideration the expressions of the Chancellor, Mr. Bone said the committee had decided to recommend

the vestry to abandon the appeal and apply for a new faculty. The Chancellor, he might add, did not object to the committee taking down that portion of the tower which was absolutely dangerous.—Mr. A. De C. Glubb proposed a resolution abandoning the appeal against the decision of the Chancellor of the Diocese refusing a faculty for removing the present tower of the church and rebuilding it, and that the previous application for a faculty be withdrawn and a fresh one applied for as soon as new plans were approved, Mr. Sansom to prepare the fresh designs. The motion was adopted.

THE Marquis of Huntly, Lord Rector of Aberdeen University, has received from Mr. A. Marshall Mackenzie, A.R.S.A., architect, a statement to the effect that the question of the retention or not of Greyfriars' Church as part of the University buildings at Marischal College is a subject to which he had given much consideration ever since the first proposals for extensions towards Broad Street were made, and had frequently advised that the old Gothic building should be retained and restored. He held this opinion from artistic reasons quite independently of the strong antiquarian and historical ones that existed. The quadrangle would lose in effectiveness if thrown entirely open by the removal of the church. In any restoration of the Greyfriars' building, the mean-looking modern parts, such as the wing towards the quadrangle and the gable next the entrance gate, would be demolished, the church lengthened by a bay, and the beautiful series of seven windows facing Broad Street filled with tracery. The restored building would therefore have quite a different appearance from that presented to the eye at present. Its dark freestone colour would form a refreshing contrast to the light grey granite of Marischal College, and the long horizontal lines of the church would, in the same way, enhance by contrast the vertical lines in which Marischal College was designed. The slight departure from the symmetrical position of the south tower, which the retention of the church would involve, was a distinct gain to the general artistic effect of the buildings, and would prevent a feeling of over-rigid symmetry. He feels quite certain that the effect of the whole will be much more delightful and beautiful if the old building is retained to contrast and group with the new, than if it were demolished, and the quadrangle entirely exposed.

THERE appears to be a good deal of misapprehension with regard to the Peel pictures, concerning which so much has been heard lately. The impression has got abroad that the gallery at Drayton Manor contains the collection formed by the great Sir Robert Peel, whereas the larger portion of this collection was sold to the nation by the late baronet about twenty-five years ago for £70,000, and now hangs in the National Gallery. The Drayton pictures are chiefly portraits, with a few works of the Dutch and Italian schools.

A STRIKING instance of zeal in the service of the Church comes from Southrey, Lincolnshire, where the curate of Bardney (Rev. Mr. Knox), who qualified as an architect before entering the Church, is now acting as clerk of the works, foreman of building operations, joiner, bricklayer, and general labourer on the church he has himself designed. The church is of wood, felt-lined, match-boarded inside, possesses a beautiful spire, and is built upon a concrete floor, which the curate has himself assisted to lay down.

MR. WATTS, R.A., who recently celebrated his eighty-first birthday, is in excellent health at Limnerslease, his charming house at Guildford. Fifty years ago Mr. Watts had been a resident in Italy for some years, living at Florence in the retinue of Lord Holland, who was our attaché there. A relic of that time is to be found in the portrait of Lady Holland, which was first exhibited in the Royal Academy exactly half-a-century ago. Another result of that friendship is to be seen in the

artist colony now to be found on the outskirts of Holland House, where Mr. Watts settled on Lord Holland's property, to be followed by Leighton, Fildes, Prinsep, Stone, Colin Hunter, Shannon, and others. Mr. Watts's wide experiences as a portrait-painter leave him two strong impressions—that Mr. Gladstone is the most distracting sitter he ever had, and that Lord Rosebery looked ten years younger after his retirement from the leadership of the Liberal party.

A BILL was passed through Parliament some two years ago for the widening of Blackstock Road which slopes upwards to Highbury Park. This improvement involved the pulling down of a number of old tenements which caused the road to narrow for about 120 yards, and the making up the road to the same width as the other part of the Blackstock Road. To do this a hoarding was placed on the margin of the ground occupied by the said tenements, and in order not to obstruct the traffic any longer than was absolutely necessary it was decided to make up the new portion of the road, pavement, etc., first. This was done. Next the other side had to be made up to correspond with the new portion. After this work had been in hand some weeks, it was discovered that the new portion of the road was considerably higher than it should be, and the consequence is that all the work that has been done to that portion has to be taken up and done over again in order to get a level road. The foreman who superintended the first half of the road-making was so disgusted with the interference of the Works Committee, according to local residents, that he resigned, and another man was found to continue the work.

THERE is so great a tendency in London to allow considerations of utility more than their due weight, and to neglect æstheticism, that such a scheme as is now being discussed for the rearrangement of Westminster needs to be most carefully watched. It is undeniable that from time to time the rebuilding of even the most interesting quarters of the Metropolis must become advisable, and that we have to face the necessity of adapting streets that have survived from past centuries to present-day requirements. But it is most important that this process of remodelling should be carried out on really judicious lines, and that what are called improvements should be so in something more than name. Nowhere is this need for care greater than in Westminster. There we have, grouped together, some of the most admirable examples of Architecture of various periods, and some of the most valuable illustrations of our national history. To destroy these, or even to diminish their picturesqueness and their old-world charm, would be to commit an act of vandalism most discreditable to our modern civilisation; and, as a building syndicate can hardly be expected to have much conscience in matters of artistic moment, the necessary steps to prevent reckless destruction must be taken by independent people of taste.

THE tragic fate of a French lady, recently reported, seems to carry with it a warning of the danger of the French window. The French laugh at our "guillotine windows," and greatly prefer their own, which open inwards, and freely admit light and air. But many of us think, and this case goes some way to prove it, that they open too low. The opening is commonly little more than a foot from the floor, and, though there is a safety bar at some distance above, this itself is too low to afford absolute security against accident. Then, the opening wastes space within the room, as a certain free way has to be allowed for the movement of the frame on its hinges. This makes it impossible to place a dressing table quite near the pane. Moreover, the vertical opening floods the room with cold air from top to bottom. With the much abused guillotine, the stream may be confined to the upper part of the room. Yet ours is still a cumbrous contrivance, in spite of everything, especially when it "sticks," or when the cords begin to feel the effects of age. The ideal

window has yet to be invented. Perhaps something that would set the whole apparatus of the guillotine in motion by the mere turning of a handle within the room would meet the want. This, however, might turn out to be only one more contrivance to go wrong.

It is still hoped that the first quarter-dome, of which there are four above the pillars, that serve to support the great central dome of St. Paul's Cathedral, will be unveiled at Easter. The actual mosaic work has long been completed, and the decoration of the surrounding portions is making steady progress. Here Christ is represented as crucified in the centre of the Tree of Life, beneath whose wide-stretching branches stand on one side Mary, the mother, and St. John; on the other the two Mary's. Shadowed, too, by the extremities of the boughs are, to the right, Eve, in supplicating attitude; to the left Adam, pointing towards the Sacrificed One. From the base of the tree bursts a stream of water symbolising the Gospel, and overhead the sun, in token of God's love, shines on the central figure. In the south-west quarter-dome the cartoon for the entombment has just been put in place, one of the four subjects intended to illustrate the doctrine of the Atonement. Here again Sir William Richmond aims to convey a sense of underlying joy. By the open tomb before a cross the body of Christ lies in the arms of an angel, eight of the Apostles gathered round; but the scene is a garden bright with spring flowers, through which flows the River of Life. The remaining quarter-domes will contain presentations of the Resurrection and the mission of the Apostles.

THE much-maligned Liverpool Town Hall is at last to be handed over to the care of the decorator. Professor Simpson, of University College, has been entrusted with the designs for the entrance hall and grand staircase. The building is one of the most deceptive pieces of Architecture in the city. From the outside it appears much smaller than it really is. It is not until one passes along the suite of magnificent apartments leading to the great hall that a real conception of its immense size is gained. It may not be generally known that a large painting, by Paul Delaroche, of Napoleon crossing the St. Bernard, hangs in one of the salons of the town hall. The picture is an important example of Delaroche's most polished manner.

THE Council of the Society of Arts recently attended at Marlborough House, when the Prince of Wales, president of the Society, presented the Albert medal to George James Symons, F.R.S., "for the services he has rendered to the United Kingdom by affording to engineers engaged in the water supply and the sewage of towns a trustworthy basis for their work, by establishing and carrying on during nearly forty years, systematic observations (now at over 3000 stations) of the rainfall of the British Isles, and by recording, tabulating, and graphically indicating the results of these observations in the annual volumes published by himself."

"A HOUSE AT BEXLEY," illustrated on our central pages, was designed for a doctor, and contains on the ground floor, in addition to a hall, dining-room, and drawing-room, a small surgery, with separate entrance for patients. On the first floor there are five bedrooms, with bathroom and three large attics in the roof. The general character of the interior suggests rather the homely comforts of the farmhouse than the flimsy gentility of the villa. The fireplaces are arranged as ingle-nooks, with wide, open hearths and settles. The walls are finished with panelling, and the ceilings with massive beams. The hall, which is carried up through two stories, is the principal feature of the house, and is arranged so that it is not a passage for servants or visitors, and may be used as a sitting-room. The proposed materials for the building are red brick, with half-timber work and tiled roof. Mr. W. H. Baillie Scott is the architect.

KEYSTONES.

A NEW reredos has been erected in Rufforth Church, Yorkshire.

THE Court of the Founders Company contemplate holding an exhibition during the summer of designs in brass and other metals.

AT Portsmouth a new hospital infirmary and nurses' home has been erected, at a cost of £24,000, in connection with the Portsea Island Workhouse.

A MEMORIAL chancel and screen and credence table have been added to St. Thomas's Church, Wincobank, Sheffield. The screen is of oak, and was made by Messrs. Jones and Willis, of London and Birmingham.

THE Church of St. Mary Magdalene, Massinger Street, Old Kent Road, has been restored. Among the gifts towards its furniture is a stone pulpit, removed from St. John's, Kingston Vale.

A NEW chapel has been built at Morley, from designs prepared by Mr. T. A. Buttery, at a cost of £2500. The building is in the classical style of Architecture, and provides accommodation for 577 adults, and is lighted by electricity.

RECENTLY the new parish church at Roehampton was consecrated. The church, when finished, will be one of the most beautiful in the diocese of Rochester. It has been enriched by many valuable gifts. The architect is Mr. G. H. Fellowes Prynne.

THE Church of St. Hugh, in Crosby Row, Southwark, has just been dedicated. Constructed from designs by Messrs. Carpenter and Ingelow, the church has cost £4700, but £5000 more is wanted to complete the upper portion.

THE present church at Rowley Regis, built fifty-five years ago, is in a dangerous condition. Plans have been prepared to rebuild it at a cost of £10,500, including £2500 for the tower. The work is to be done in sections the first of which will cost £5000.

THREE shops are about to be erected at Hill Rise, Richmond, according to the designs of Mr. P. Hoffmann, of 152-3 Palmerston Buildings. Mr. Hoffmann has also designed a block of flats for Sloane Court, Chelsea, the estimated price for the erection of which is £18,178.

THE new polo pavilion, at Ranelagh, which occupies the same site as the old one, is rapidly approaching completion. The structure has been designed by Mr. Alfred Burr. Its length is 118ft., in two storeys, the whole being built of the b-st pitch pine, with two verandahs running along its full length.

THE famous Gabrielli collection of old engravings has been purchased in Rome by Mr. Davidson Dalziel from Prince Gabrielli. The collection consists of nearly 7000 specimens of the graver's art, and none of them is of later date than the seventeenth century. The price paid was £3500.

A TESTIMONIAL in recognition of the long and successful services of Mr. Francis H. Webb, as secretary of the Institution of Electrical Engineers, has been presented to him. The testimonial took the form of a cheque for over £600, together with a diamond brooch for Mrs. Webb, and an illuminated address.

THE railway which the Congo State has in contemplation will have a total length of 1000 kilometres, and will run from Acuentana, on the River Stimbiri, and Redjaf, on the Nile. From Acuentana the railway will follow the Stimbiri as far as Eringa, and continue via Niangara and Lazzoland.

AT St. Gabriel's, Warwick Square, Pimlico, has been erected a reredos, altar rails, and other decorations in the sanctuary, at a cost of £2500. The subject of the reredos is the Crucifixion. The rest is opus sectile, by Powell, of Whitefriars, and consists of types of our Lord as Prophet, Priest, and King, and of His Passion.

THE Plymouth Corporation has applied to the Local Government Board for sanction to borrow £70,000 for the improvement of Tavistock Road and place, £10,215 for the provision of houses for the working classes, £2750 for works of street improvements, £2600 for works of sewerage, and £2070 for the erection of a police station.

Surveying & Sanitary SUPPLEMENT.

MARCH 9TH, 1898.

Practical Carpentry and Joinery.*

By GEO. ELLIS.

(Continued from page vi.)

CENTERING is the name given to various rough frames, constructed of wood, to support stone, brick, or cement arches during their building and until they have set. They must be constructed in such manner that their shape will not be altered by the pressure of the arch, be easy of erection and removal, be capable of gradual release, or "striking," and, as they are purely temporary appliances, be designed so as to injure the timber as little as possible, with the view of its subsequent use for other purposes. They should always be of ample strength for the occasion; to avoid any crippling due to flexure of material, the dead weight being thrown to the foundation. Centres for arches of large span require careful trussing, as the strains vary, both in amount and direction, as the work progresses. There is always a tendency, but more especially in flat arches, for the crown to rise whilst the haunches are being built. This is sometimes met by weighting the crown with the material for the arch, but, in view of the constant and discriminating attention required to properly arrange the load, it is better, apart from the expense, to so truss the centre with tie-rods and struts that it will be practically unalterable.

Fig. 77 shows the form of centre in use for turning small brick segmental arches. The rise being less than the width of an ordinary board, the two ribs R are shaped to the curve, kept parallel by stretchers S nailed on the bottom, and the circumference covered with laggings about 2in. by 4in. For brick and other rough arches these are spaced about an inch apart, but for gauged brick or groined arches they are fixed close to each other, and the surface made regular with the plane for the bricklayer to mark his courses upon (see Fig. 82). When stone is the constructive material, the laggings are made stouter, and are spaced at wider intervals—from 6in. to 14in., according to the size of the blocks in

FIG. 77. A SMALL RIB CENTRE. ELEVATION.

FIG. 78. SECTION.

use. For all ordinary work it will be found better to increase the number of ribs rather than the thickness of the laggings. A centre for a larger span, with built-up ribs, is shown in Fig. 79. This kind may be safely used in spans up to 12ft.; the boards forming the ribs are cut to shape and nailed in two thicknesses, the butt joints of each layer falling in the middle of the length of the contiguous piece; the joints should be perpendicular to the curve, and it is essential that they fit properly; one or more braces B may be introduced, as the weight to be carried may indicate, and pairs of folding wedges are used between the supports and the stretchers S for the purpose of setting the centre up level, and so that it may be struck gradually. Sometimes, to make this form of centre stiffer, two tie-pieces T are used to each rib, bolted together with coach screws, and the ribs cut of stouter stuff (in one thickness), the lower ends shouldered between the ties, as are also the ends of the braces; but it will be found advisable, and also economical, to use a framed centre (as shown in Fig. 81) for large spans, or where the weight to be carried would render it dangerous to use a "built-up," whose strength mainly depends upon the accuracy of the joints.

The framed centre (Fig. 81) is formed by

trussing a frame of rough timber as a foundation for the ribs, to which the laggings are attached. This can be made similar to either a king or queen-post truss, as the span may require, but the strains should in all cases be directed to the points of support; when possible, there should be intermediate supports to the tie, but this is not always practicable, the roadway at times being required for the passage of material, and in such cases the ties must be made deeper to ensure stiffness. As will be seen by reference to the figure, the main timbers are arranged in the form of triangles, and framed together with stub-mortise and tenon joints, the shoulders being brought up, with timber dogs. The ribs are then cut in between the ends of the braces, to which they are spiked, and their joints dogged up. These ribs are usually cut out of 9in. by 2in. stuff, and when, in consequence of the quickness of the sweep, they are pitched up at the joint, a short puncheon, P, is introduced. The laggings, 3in. or 4in. by 2in., are nailed on the ribs at intervals of an inch. The ribs should not exceed 3ft. apart, and are further tied by the three stretchers, S. A piece of quartering, also called a stretcher, is usually spiked to the head of the supports to steady them whilst the centre is wedged up level. There should be a post under each rib, and in the middle this form of trussing will do for spans up to 25ft. Beyond that a kind of queen-post truss should be used, for which consult the chapters on "Roofs," No. 142.

In building continuous arches, as in vaults or tunnels, the centering is made about 6ft. or 8ft. long, and so much of the arch turned, the centre being then lowered and pushed forward to receive another bay. Sometimes, when it is desired to push on the work rapidly, a second centre is used, and is set up next the first, after the first portion of the arch is turned. The second is then proceeded with, and when completed the first centre is struck, and re-set at the other end of the second, and so on to the finish, giving time for each section of brickwork to set whilst the succeeding one is being built. Fig. 82 is the elevation and section of a close-boarded centre for a Gothic arch, and clearly shows the method of preparing these for gauged work.

SUBSIDENCES.

AN IMPORTANT CASE IN THE LAW COURTS.

IN the High Court of Justice (Chancery Division) Mr. Justice North, a few days ago, gave judgment in the case of *Jordeson v. the Sutton, Southcoates, and Drypool Gas Company*, the trial of which occupied the Court for a fortnight. The action was brought by the owner of some very small houses in respect of injury to the houses arising during the construction of a very large gasholder close to them, and of prospective obstruction of access of light to the windows of the houses. The houses are of a poor class, being let to weekly tenants at rents of about 2s. a week, but the case raises important points of law as to the right of a person to abstract water, or water and silt, by works on his own land from a substratum of his neighbour's land, and so let down the surface to the injury of buildings thereon, and the

MUCH-DISCUSSED QUESTION

whether a corporation or body, given powers coupled with corresponding duties in the exercise of those powers, are entitled to interfere with the rights of neighbours in the enjoyment of their property. Mr. Jordeson, the plaintiff, is the owner of some twenty-four cottages in Hull, adjoining the premises of the defendant Gas Company. In July, 1896, the Gas Company began, by their contractors, Messrs. Holmes and King, who are also defendants, to excavate for the purpose of constructing a sunk gasholder tank in which to receive and seal with water a very large telescopic gasholder, intended to rise when fully inflated to over 100ft. above the ground level. The circular trench which the contractors made to build the enclosing well of the tank was only a few feet from the back wall of the nearest cottage. The trench was carried down to a depth of about 36ft., and the work had to be carried through a variety of strata, one of which, designated running silt, was particularly difficult to deal with. This stratum was about 6½ft. thick, and was

immediately followed by a thin layer of soft clay, below that being a firm basis of impermeable gault clay. The plaintiff alleged that cracks on his land and in his cottages had occurred

IN CONSEQUENCE OF SUBSIDENCE

caused by the withdrawal of water and sand in suspension from the running silt bed; and he

FIG. 82. A "GOTHIC" CENTRE. ELEVATION.

FIG. 83. SECTION.

further alleged that the contractors had not adopted the best known methods of damming back the water and silt during the operation of constructing the tank; in other words, that there had been negligence. A great deal of technical evidence was given on this part of the case as to what the best mode of making an effectual dam is, with the usual contradiction in expert evidence. One question between the parties was whether, on the construction of their own special Acts, coupled with the Incorporated Gas Clauses Acts, the case was within the decision of "*The Metropolitan Asylums Board v. Hill*" (6 Ap. C., 193), in which it was held by the House of Lords that the Asylums Board could be restrained from erecting a smallpox hospital on land bought for the purpose in a residential neighbourhood; or the subsequent decision of the House of Lords in "*The London and Brighton Railway Company v. Truman*" (11 Ap. Ca., 45), in which it was held that the appellant railway company were entitled to use land bought under power to purchase additional land by voluntary agreement for cattle sidings and yards, to the annoyance of the inhabitants of a residential district at Croydon. The defendant company, as to the removal of water and silt, contended that they had a common law right

to remove water, even if in doing so they abstracted matter in solution; and that any damage caused to their neighbours' property thereby was not actionable. It was also contended, as a matter of fact, that the subsidence which took place was due entirely to the abstraction of water alone and no appreciable subsoil had been abstracted. The defendant company also contended that they were given powers for public purposes, coupled with a duty to supply gas, which could only be fulfilled by the construction of the gas holder, and that, apart from the question of negligence in doing the work, they were entitled to interfere, to the extent they had interfered and proposed to interfere, with the rights the plaintiff would otherwise have had.—His Lordship delivered a short judgment on the issues of fact, reserving for consideration the points of law necessary to be decided on those findings. He found that the gasholder, when erected and inflated to the proposed height of over 100ft., must interfere with access of light to the cottages, but that he could not say that that plan of doing the work was improper. He held that the plan adopted had been skilfully carried into execution, and he held that subsidence was due not merely to the abstraction of underground water, but also to the abstraction of silt held in suspension in the water abstracted.

THE main sewerage and sewage disposal works for Pocklington, Yorkshire, have just been completed. The engineers are Messrs. D. Balfour and Son, of Newcastle, and the contractor is Mr. Thomas Bell, of Market Weighton.

FIG. 84. A COMPOUND CENTRE. ELEVATION.

THE scheme for the improvement and development of Seaham Harbour embraces the practical reconstruction of the docks. It is proposed to enlarge one of the docks to about double its present dimensions, and increase the depth of water at high tide from about 14ft. to 26ft. This will admit steam vessels of the largest class to trade from the port. Plans have been prepared, and estimates drawn up by Mr. H. H. Wake, chief engineer to the River Wear Commissioners at Sunderland. Two new piers are to be built, and a spacious outer harbour formed, with a south-east entrance from the sea. The construction of the new works will, it is thought, occupy about five years.

It is stated that the Government contemplates the appointment of a Royal Commission to investigate the bacterial treatment of sewage. It is high time that we had some authoritative pronouncement on this subject for the guidance of local bodies, and a small commission of experts furnished with power to conduct experiments would greatly help in settling a question which is at present in a most unsatisfactory condition. Local government authorities are frequently considering the various systems. The disposal of sewage is a modern problem of great public importance and urgency, but still so far from solution that expert opinion about it can only be described as chaotic.

Surveying and Sanitary Notes.

FARNBOROUGH DISTRICT COUNCIL has had a great number of letters from military officers and others living in the parish complaining of alleged nuisances upon their premises through the manner in which the contractor employed by the authority carried out his duties. The writers threatened to take immediate action against the Council if the evils were not at once remedied. A minority of the Council urge that a £30,000 drainage scheme be at once started, but the majority are in favour of adopting the septic tank system of sewage disposal, and correspondence is now going on with the Exeter patentees. The chairman, Mr. Blake, moved that the Council absolutely decline to employ any more cesspools in the locality, and tell the officers and others to do the work themselves, as the majority of the Council were quite sick of trying to please them. They would then get a legal decision that would decide once and for ever the question of their liability from a sanitary standpoint. The motion was carried by six votes against four, and the contractor was paid off forthwith.

A CASE of considerable interest was recently heard in the Queen's Bench Division by Mr. Justice Wright. It was that of Barnes v. Seantlebury, and was an action brought by the plaintiff, Mrs. Barnes, against the defendant for damages for breach of an agreement.—The plaintiff, by an agreement dated August, 1896, agreed to take a lease of a house, 5, Orsett Terrace, in the parish of Paddington, belonging to the defendant. The defendant agreed to do certain work to the house, including work to the drains, to the satisfaction of the vestry authorities. An old soil-pipe was to be removed. When the plaintiff entered into possession of the house in September, 1896, smells were at once observed, and shortly afterwards the plaintiff's eldest daughter contracted a sore throat, and was advised by the doctor to leave the house. The plaintiff had the drains examined, and it was then found that the lower end of the soil-pipe had not been removed, and that it was connected with an old lead D-shaped trap, and with 3ft. of brick drain. According to the plaintiff's case, the trap contained a deposit of 3in. thick of sewage matter, and the smells and the illness

of the plaintiff's daughter was attributed to this cause. The agents of the defendant's property were Messrs. Hunter and Hunter, one of whom was a member of the Paddington Vestry. The contractor employed by Messrs. Hunter was also a member of the vestry, and the contractor's son was the sanitary inspector of the district. The work was inspected by the sanitary inspector and was passed. It was suggested on the pleadings that the satisfaction of the sanitary inspector was not properly obtained, but that charge was not persisted in. The defendant's case was that, although under the terms of the contract the whole of the soil-pipe ought to have been removed, yet that no damage had resulted from its remaining in its place. The soil-pipe was not connected with the drainage, and it was contended that the matter found in the trap could have caused neither the smells nor the illness of the plaintiff's daughter.—His Lordship, in delivering judgment, said that there was one matter of importance which did not affect the question in the case, but which called for a remark, and that was the system by which members of a vestry were enabled to work into each other's hands. It appeared that a member of the vestry was employed by the landlord of this house as his agent; the agent employed another member of the vestry, who was a contractor, to do work in the house; and the work was, after its completion, inspected by the contractor's son, who was a sanitary inspector of the vestry. Such a state of things was a reproach to the whole system of local government. His Lordship was of opinion that there was not sufficient evidence that the principal damage complained of by the plaintiff was due to the admitted breach of agreement by the defendant, but he awarded £2 damages in respect of the opening up and removal of the soil-pipe. He awarded costs to the defendant, allowing £10 to the plaintiff in consideration of her having partially succeeded in her action.

THE new sewage works constructed by the Midsomer Norton (Somerset) Urban District Council were recently opened. The process is that of precipitation by chemicals and filtration through artificial beds and land. The sewage on admission to the works passes first through a straining grating, where all coarse matters and foreign bodies are retained, and then through a scum and detritus chamber, which intercepts sand and fatty matters. Next the chemical precipitant (Ferozone) is added, the mixing being done by a "Kierby" machine, the motive power of which is a small water-

wheel worked by a portion of the river water which has been diverted for that purpose. After the precipitant is added, the sewage is passed over a series of iron bafflers, which thoroughly mix the chemical with the sewage, and it then enters the first settling tank. This tank is 16ft. in diameter, and 10ft. 6in. deep, and the sewage enters at the bottom by a series of vertical inlet pipes, and is discharged from the top by means of wood-collecting channels, and it is found that by this method all the solid matters in suspension are retained at the bottom of the tank. This is removed daily by means of an ingenious revolving steel arm, and is run on to prepared and drained sludge lagoons, where it is dried for removal, the thin liquid portion which is drained off being pumped back into the inlet chamber for re-treatment. After leaving this tank the sewage is run through another of similar design and size, and it is believed the present instance is the only one where duplication of tanks has been carried out, the engineer claiming that by means of it a better effluent is produced at a reduced consumption of chemicals. The tanks are so arranged that the sewage can be run through either of them separately, through both equally, or through one after the other. From the settling tanks the sewage effluent is now run on to the filter beds. These are four in number, each 40 square yards in area, and are composed of gravel sand and a patent filtering medium, known as "Magnetite." Either one or more of these beds can be used at the same time, and by an ingenious system of valves the effluent can be sent through any bed or beds and then brought up through any other bed, for the purpose of washing the top sand with the filtrant, and thus effecting a considerable saving of labour in sand washing. Leaving the works, the filtrant is conveyed by a 12in. pipe for a distance of about 600 yards on to the outfall land, situated near Old Welton Colliery. Of this land about four acres have been laid out, channelled, levelled, and under-drained, and, after passing through this, the now purified sewage is discharged into the stream. The engineer for the works is Mr. W. F. Bird, C.E., Surveyor to the District Council; the engineer consulted to report upon Mr. Bird's scheme was Mr. T. S. McCullum, C.E., of Manchester; the contractors for the principal works are Messrs. Thomas and Webb, of Bristol, and, for the Outfall Land Works, Mr. W. A. Catley, of Midsomer Norton; and the clerk of works has been Mr. A. B. Carter.

ON THE TRAINING OF ARCHITECTURAL STUDENTS.*

BY FRANCIS H. NEWBERRY,

Head Master, The Glasgow School of Art.

"DRAWING may be taught by tutors, but design only by Heaven." So says John Ruskin, a writer whose thoughts I shall have occasion more than once to call to my assistance; but like other phrases coined by that aphorist in art, the sophistry of its meaning separates human execution too widely from human ambition—what we do from what we desire; and I would suggest that the sentence would read much better if it had in addition, the wholesome and cheering proverb, "Heaven helps them that help themselves." Genius or inspiration, when its existence is proved as belonging to any one man or work, may or may not be a Heaven-sent gift; but, believe me, study and practice go much further than is commonly supposed towards developing the latent powers of a man, else would genius knock in vain for admission, or, if the door be opened, be greeted as a stranger. How best, then, to cultivate the powers that belong to any ordinarily-endowed architectural student, so that he may, if not excel his fellows, take at least a position which may have

THE CREDIT OF A RESPECTABLE MEDIOCRITY,

and, leaving genius out of the question, educate him so that he may know what he has to do and do it, is my object to show. There comes a point in the education of every earnest man when teaching, as such, becomes practically useless and guidance even may be at fault. Up to that point I would go, and patent to the subject of this paper, would venture to indicate how to me the artist in the architect may be developed, leaving to others the task of dealing with the technical workman and knowledge of an architect's business. This division I make empirical. Architecture is a fine Art whose appeal to ourselves is made through the medium of building. "To build is, by common understanding, to put together and adjust the several pieces of any edifice or receptacle of a considerable size, and building does not become Architecture merely by the stability of what it erects. Architecture is the Art which so disposes and adorns

THE EDIFICES RAISED BY MAN,

for whatsoever uses, that the sight of them contribute to his mental health, power, and pleasure." Ruskin here makes a sharp division between building, as such, and Architecture, which may be co-existent with it, and adds a corollary, that if, as goes in the saying, the architect be the artist, then in common with him he is divisible so to speak into two men—the designer whose brain conceives and the workman whose hands execute. With the first man we have to do. Now, let us take the education usually afforded to an architectural student outside the educative influence of his master's office. (1.) A course of building construction of the book order, generally and chiefly given less with a view to the cultivation of a knowledge in the student than with the object of filling him with a superficiality which shall enable him to pass certain examinations. In it he digs

FOUNDATIONS WITH IMAGINARY SPADES

to unknown depths, piles ethereal brick on brick till his shadowy walls eclipse Babel's fabled height, covers this with a roof as vague as the empyrean blue, and having completed an edifice, whose inhabitants would find their chief safety to lie in the living outside, rather than inside its sheltering walls, the student sits down wonderstruck with the result of his efforts and in the possession of—a certificate. He is then in a position to pass on to (2.) a study of the orders; likewise learnt from paper. By these means he gathers the informa-

tion that the Greeks were eminently a mathematical race; that their edifices were composed chiefly of compasses and set squares; that they put two on three and five became a thing of unutterable beauty; and the Parthenon, which, he may perchance be dogmatically informed, was a temple of exquisite proportions, appeals to him as a huge arithmetical sum whose decorations consisted chiefly of entablatures, modules, triglyphs, and diameters. He next passes on to the third and final stage, whereby his education is to be thoroughly completed—namely, design. This is too vast a field of opportunities to him for me to safely follow. It usually commences with a cathedral and ends with his waking up to the stern reality of every-day requirements. This description may be an exaggeration of the real faults, but the recognition of faults is half their amendment, and it will well serve its purpose if it show the fallacy of such

A SYSTEM OF PAPER INSTRUCTION.

You will notice that in it nowhere is the artist considered. The workman everywhere predominates. Not an appeal to the principles of the past varies its monotony, or a ray of light from the spirit of the great works which still cover our earth enlightens its darkness. That an architect must learn construction must be conceded at the very issue, but whilst learning in the present how to construct a house for the future, he need not neglect the study of how buildings were constructed in the past; and the same treatment of his subject applies to every phase of his studies. The letter of the Greek must be obeyed before one can catch a breath of the spirit which animates a classic building, and the design which is to be, must be developed from a knowledge and acceptance of what already exists. But this brings the student at once into a clearer light, and into a field as vast as the world is old, a light which enables him to read and compare the lessons which past experience, as manifested in architectural structures, is ever inculcating, and a field which

STIRS THE CREATIVE FACULTY

in him to emulate, before endeavouring to surpass, that which the efforts of dead minds have created. An Art student should learn his lines by analogy, not by imagination, his proportions not by creation but by comparison, and his masses not by indication but by imitation, and he should become the artist not in spite of, but because of his education. Let the architectural student do the same, and a like result should follow. This last paragraph gives the three heads into which I would divide the education of the architect, namely, Line, Proportion, and Mass. I should state, however, that, for my own part, I fail to see the slightest reason why he should be treated differently from an ordinary Art student, but as it is felt that he should always work in close alliance with his subject, I will accept such a view, if for no other reason than to prove that the artist can be got out of him as well by these means as by any other means. Coming, therefore, to

LINE,

visions of plans, elevations, sections, enlarged details, perspectives, &c., rise to view. Banish them at once. Their lines represent no more the ideas of an architect than do the words of a language the thoughts of a poet. The lines I allude to lie in other places and on higher levels, and are not of a necessity made by a pen. A certain chimney-stack of this city, we are informed, rises into the air as high as the spire of Strasburg Cathedral; yet who would turn for an instant from the contemplation of the living lines of that or any other cathedral spire to look upon the ruled contour of the highest chimney stalk the world possesses. The elliptical lines of the Parthenon fascinate us by their appeal to our sense of the beautiful equally as the lines of a railway bridge over a river repel us by their incarnation of the ugly. Yet both are lines, and, to come to details, the segmental curve of a Roman moulding can never satisfy us as does the freehand sweep of a Greek ovolo, or the flying line of a Gothic buttress. How,

then, is our student to obtain the power of drawing a line, and to cultivate

THE SENSE OF BEAUTY IN LINE?

Why, I should say, by not—as is usually the case—beginning at the wrong end, and accepting results without due regard to means. Let us take our student powerless to draw anything, or to express a single idea by means of his pencil. What should he do first? Certainly not draw lines by means of a T square, nor obtain their measurements by the use of compasses. I know I strike here at the root of the system usually followed. But the architectural student has this in common with all other Art students, namely, that his education, like theirs, should be of a kind that should develop two great innate qualities, namely, the power of the hand to draw a line, and the power of the eye to rightly compare or apportion its length. And yet he has to do this by drawing a line parallel to another line, and by blinding his eyes with a foot rule! He is drawing plans and elevations—surely a part of his education. Granted; but we see objects seldom either in plan or elevation, but always

AS FACTS IN PERSPECTIVE;

rarely do we conventionally see them, but always naturally. Take a common example, namely, a drawing in elevation of three or four flooring boards, supported on a joist as usually found in works on building construction. Now, you must have a design of this nature to make what is called a working drawing; but as we do not, as a rule, exist with our heads wedged in between the joists of a floor, but with our feet standing upon the floor, it occurs to me that our student would receive a far more valuable accession of knowledge were he taught first to realise things as they are, and as they really exist, rather than as they appear in the conventional rendering of a workman's drawing. Let him therefore be taught to draw flooring boards as he sees them when walking across them every day, and then analyse their technical construction afterwards. But this entails a knowledge of perspective. Certainly. Why not? To realise facts and not experiences should ever be the aim of all Art education, and a student should learn what is required of him by a necessity which is ever the mother of invention. It were needless for me to multiply examples of this nature. They occur in a house, from the sleeper walls to the ridge-piece, from the footing to the chimney-pot, and I would submit that even only for the mere exigencies of time the student should rather be taught to make a freehand drawing which should realise this object, than a plan and elevation which should give its mathematical measurements. Let us then return to our student, whom we have left anxiously awaiting his fate at our hands, and tell him to

PUT ASIDE HIS COMPASSES AND T-SQUARE

and learn how to draw, or, put more practically, to learn how to realise the facts of the appearance of any object placed before him, but in so doing never to forget that he is to be artist in the architect. No royal road lies here. He may be a Michael Angelo in embryo, for power of design, or a Palladio in similarity of adaptation, but, like them, he must learn that before he can design a dome he must be able to draw a dome, or to rightly impose an order, must train his eye to see the ordered beauties of proportion in an order. It seems to me to matter little at first what the student is set to draw, but as in my premises I granted that he may be confined to his subject, let him draw from good examples of architectural ornament and work, common enough in all well-equipped schools or classes. Taking classic details at first, whose beauty, as that of all good work, consists in their simplicity, and passing on from these to Gothic, where fancy broke through ordered rules and left the architect with a freer if not so learned a pencil, I would have him draw with pencil, pen, and sepia, from fillet to temple, and from Gothic leaf to cathedral, not as studies merely to enable him to have a command over his pencil, but, under instruction,

* A paper read before the Architectural Section of the Glasgow Philosophical Society.

seeking out and comparing their hidden beauties and subtle boundaries, till he realises what is meant by the power of a line which is neither crooked nor straight, arched nor horizontal, and the beauty of a proportion untrammelled by rules and yet capable of the highest mathematical exactness. This may sound impractical, and the question may be asked—Is the period which a student can devote to his education long enough for all this? I reply, yes; for all this and much more, for I am training my man; he will educate himself. All this need not be done at school or during any so-called period of education. To cultivate his powers of perception and selection, to heighten his sense of beauty, and to make him work, is all I want. The rest can safely be left to take care of itself. He will find out sooner or later by these means wherein his chief powers lie, and, if his education end with his life, it will be because he realises its necessity. I would have no rule, or set of rules, even if such were possible, to make the student an architect, "but arouse his sympathy and stir up his imagination, and he may after that be neither feeble in life nor forgotten in death." So says John Ruskin, helping heaven to realise the architect in the man. Of one thing we may be quite certain, that this proposed course of education will have made

THE STUDENT ABLE TO DRAW,

and that being done a part of the battle is won, and we shall have realised the first half of Mr. Ruskin's aphorism, "Drawing may be taught by tutors." We will try whether we cannot meet heaven half way on the second part. Now, you can arm a soldier, but you cannot make him fight. You can, however, show him how, and the providing him with arms is an absolutely indispensable part of this latter proceeding. An architect unable to draw, not with mathematical instruments, which I do not consider the true architect's properties, but with a pencil, is like a soldier starting to do battle without the previous provision of offensive and defensive armour. Both are useless for real work. I stated in my opening sentences that "there comes a point in the education of every earnest man when teaching, as such, becomes practically useless." Naturally, I do not consider that point to be reached when a student has been taught simply how to draw. Instead, however, of walking before our student, our proper place is now at his side, I think, and having made sure of his hand and eye let us turn our attention to the training of his ideas; and this brings us naturally to the second of the three divisions I have employed, namely

PROPORTION.

I should vastly have preferred that the student gained his first rudiments of knowledge in this illimitable field by a study of the figure alone, but I choose rather to come point blank to his subject, and put him through a course of what is generically known as the orders, and make him study the figure at the same time. This I do, for in Egyptian Architecture the canon of proportion was based upon that of a conventional figure; in Greek we never can rightly dissociate Greek Architecture from Greek sculpture; and only in Gothic do we have the proportions of Architecture disconnected from a consideration of the human figure.

(To be continued.)

The first bridges built were of wood, and the earliest of which we have any account was built in Rome fifty-five years before the birth of Christ. The next was erected by Julius Cæsar for the passage of his army across the Rhine. Trajan's great bridge over the Danube, 4770ft. long, was made of timber, with stone piers. The Romans also built the first stone bridge, which crossed the Tiber. Suspension bridges are of remote origin. A Chinese one, mentioned by Kirchen, was made of chains, supporting a road 830ft. in length, was built in A.D. 65, and is still to be seen. The first large iron bridge was erected over the Severn in 1777.

LEADWORK: PLAIN AND DECORATIVE.

(Continued from page 66.)

MR. SETH SMITH, commenting upon Mr. F. W. Troup's paper on the above subject, read before the Architectural Association, and which appeared in our last issue, said ever since he had the advantage of seeing Mr. Lethaby's excellent little manual on leadwork he had taken more interest in the subject. They knew that many of the old houses about the country had been treated very largely in leadwork, and not only in regard to the house itself, but also in the garden, where ornamental leadwork was employed. Mr. Troup had let them into a good many of the secrets of the success of this kind of work, and had shown how it could be done in a simpler way, so as to be more adaptable to present-day opportunities. They had had a delightful demonstration of how to carry out rain-water heads, ridges, and crockets in lead. How often they had to omit these things on the score of expense! On the other hand, there were occasions when they could do a little of this class of work, but a demonstration of this kind should re-stimulate their determination to do all they could to encourage their clients more in the use of such beautiful decorative work as could be obtained by the use of lead.—Mr. Matthew Garbutt said

LEAD, AS AN ARTISTIC MATERIAL,

was one of the many revivals they had seen recently. He would confess that until a short while ago he did not know what was done in the past in the production of beautiful leadwork. He had been rather surprised to find that even in London they had some admirable samples. He found that the statue in Queen's Square, Bloomsbury, was in lead. He daresay a good many viewed it, from a short distance, without realising what it was made of. He did not know whether it was cast or hammered work. Mr. Troup had said that cast-lead work stood the heat, in sinks and that sort of work, without so much buckling as they got with milled lead. Perhaps it was because some old ornamental things that had been cast did not appear to sag so much under the sun as the modern work did. He was certainly surprised that some work in gardens was so little distorted after bearing the sun's of many summers. With regard to colour, the grey patina seen in old lead was very striking, and he thought it was extremely likely, as the lecturer stated, that it was due to a small amount of silver. It was well known that bronze, especially that used by the Japanese, contained a good deal of silver, with the result that they got an extremely fine, grey patina; but the fine, rich, purple bronze depended upon the quantity of gold in the alloy. It was perfectly new to him to hear that they put colour on lead. They found coloured Architecture of ancient history, but it was interesting to hear that lead could be treated as a ground for colour work. Mr. Troup had spoken of soldering leadwork together as being equivalent to welded ironwork. With the latter system they had two of the same kind of materials, and they beat them together till they became practically one; whereas, when they soldered the joints, they were using a different material, which

MELTED AT A LOWER TEMPERATURE

than the metal they were soldering. Thus, to him, it seemed the joint was a point of weakness to a certain extent as compared with ironwork. He also considered that soldering was stiffer, and therefore helped to produce the cracks in the work upon which it was used.—Mr. Henry Longden pointed out that formerly lead mines were largely worked in South Yorkshire and Derbyshire, and stated that the lead used by the French, at the time stated by the lecturer, came from there. A very interesting discovery was made last year, when a pig of lead was found with

the Roman mark, by which it was traced to about the second century. The lead in Derbyshire was worked until within his recollection, but now it had practically died out. He believed what had been said about silver in old lead making it better was true. Of course, in the modern process the silver was extracted, but he believed silver in lead had something to do with the excellence of the old work. At St. Paul's Cathedral he believed they used the old lead, and melted it over and over again, though he supposed they put in a little fresh each time. As to the application of colour to leadwork, he thought he had seen some of Mr. Troup's drawings of such work in St. John's College, Oxford. It was a beautiful example of the work, and it was a thing that should be more extensively used than it was now.—Mr. A. T. Bolton observed that although plumbers treated leadwork in an interesting manner, architects seemed to leave it at the fag end of the specification; but now it seemed to be coming to the front again. He remembered that a pupil once came into the office where he was and said he had seen in London

SOME FINE LEAD CISTERNS,

but they regarded the idea as absurd. Of course, it was perfectly true, and now, in some of the old areas in Bloomsbury, could be seen some excellent lead cisterns with pattern work wrought in the relief. As to the making of lead rain-water heads, the difficulty was the expense. So few jobs could afford to have seven or eight pounds spent upon heads, but he thought architects might do more in the way of using lead pipes, which would last a hundred years, while iron would not last for more than twenty-five. But there was one point about lead pipes to remember, not to have the hydraulic. Plumbers on the job always wanted them made that way, but they must insist upon having them cast, because it made a difference in the wear and the colour, and he believed it was a cheaper way too. A year or two ago he spent some time in a country village, and there he noticed old lead pipes on which the bands were very much closer together than in modern work, being only about 4ft. 6in. apart, whereas now they had from 6ft. to 10ft. pipes. If not very careful, under such conditions, with lead bands they were nearly certain to make the mouldings too big. Another use for lead was that which he believed was often adopted by Mr. Bodley, namely, for stars and badges. It was cheap and looked very much better than painting, in fact, from below looked like painting. Then lead was very useful to form the inlay. In conclusion the speaker referred to the extraordinary knowledge of leadwork possessed by Burgess, and pointed out that it was gained by a very close study.—The Chairman (Mr. Pratt) said it had always been a question with him as to whether, in the treatment of lead, it was better to be

CAST OR HAMMERED.

He must say he had inclined to the idea that the proper treatment was beating rather than casting it. But he thought, from what Mr. Troup had shown and told them, there was a great advantage in cast leadwork. He was greatly interested in the example of cast coloured leadwork. In the course of his travels he had never come across any colour decoration in lead, and should really like to see a good sample of it. It was a sort of thing no one would have thought possible; or, at any rate, would not have thought it permanent, and he still had a doubt in his mind as to whether it was possible to apply the colour in such a way as it could be seen from a distance. On a lead font or some near work he should think it was a very satisfactory way of getting a little colour on it. Some of the best examples of ornamental leadwork were to be found on fonts and on the much humbler thing they called cisterns. There were some excellent lead cisterns in existence, but he had never been able to make up his mind whether they were cast or not. With regard to the common and everyday use of lead, one of the difficulties to the architect was to distinguish the quality. He supposed

the merchant and the builder knew it by the mark in the corner of the sheet, but unless they were pretty good judges of material it was very difficult to know what they were dealing with. In pipes, perhaps, more than in sheet lead, they came across

SOME VERY BAD SPECIMENS.

He hoped, however, the quality in the material was not deteriorating in that respect, as the possibilities in leadwork were much greater than in the past. — Mr. Troup, in responding to the vote of thanks, said he should think the statue in Queen's Square was in cast lead. It was always possible with such a material to cast the figure in parts, and solder them together, and it would be easier to join the parts of a lead statue than a bronze one. As a rule they were cast in exactly the same manner as the bronze. With reference to the remarks upon soldered joints, he regarded such joints as an opportunity of strengthening the article, simply because the solder was harder than the lead. No doubt there were certain situations where it was dangerous to solder a joint, on account of the strain put upon the metal in contraction and expansion, but on rain-water heads, for instance, it usually gave strength. There was another method of joining lead, and that was lead-burning, but it was a very difficult process, and required a great deal of skill and dexterity on the part of the workman. But it was a very beautiful method when it could be used. The real difficulty of lead-burning was in vertical work, for the workman had to know exactly when to stop the heat of the blow-pipe so as to melt the edges together, and yet not have a little piece of lead drop out so as to leave a hole between the two sheets. The difference between making lead rain-water heads, instead of iron, was that they could cast the lead in the flat, and it was

A VERY SIMPLE PROCESS.

for with lead cast in that way they could beat it up into anything they wanted and solder it together. If they followed the old method of moulding lead, they would find that it was only at the latter end of the last century they got the great working moulding, which really looked like some other material. They were never cast, but nearly always beaten out on a wooden block. To inlay upon lead was an old method with ornamental leadwork, was very easily accomplished, and was frequently used on the roofs of French houses. Then there was the method of putting tin ornament on lead. They covered it with plumbers' soiling, and obliterated the parts to be tinned, leaving the soil to keep the tin off the surrounding lead. There was another way which, he believed, was practised at Hatfield House, and that was by pasting a piece of brown paper in the shape of the groundwork and cutting out the spaces, exactly as they would use a stencil-plate on a wall. Of course the paper burnt during the process, but held it long enough to keep the tin away from the lead they did not want to cover. He thought nearly all lead cisterns were cast, and some of them in very high relief. As to the quality of lead, the sheet was often much inferior to the good pig material. Bad lead would sometimes not cast in a sheet at all, but run into holes, and sometimes, when it did cast, it turned out to be so hard that it could not be worked. So for casting sheet lead it was necessary to use very good material.

THE Yarmouth Town Council has withdrawn the proposal to spend £70,000 on the erection of a new pier on the Jetty site, with pavilion, swimming baths, shop, and arcades. It is now proposed to erect a new pier altogether.

THE fine old church of Black Torrington, Devonshire, is in an extremely bad state—roof in danger of falling, walls bulging out, and woodwork rotting away from age and damp. A committee has been formed for the purpose of raising £1200 for the restoration, re-roofing, and other necessary repairs. The present rector has undertaken to restore the chancel at his own expense at a cost of £400, provided the sum required for the other portion of the restoration can be raised.

Professional Items.

ABERDEEN.—The Finance Committee of the Town Council have approved of a feuing plan prepared by the city architect in connection with the property of Dee Village, recently acquired by the Town Council. The plan shows Milburn Street and Wellington Road widened to 50ft., and Dee Village Road to 40ft., with a row of houses fronting each of these streets, and also Crown Street.

BIRMINGHAM.—Plans have been passed for the erection of an entertainment hall, adjoining the Assembly Rooms, and it will be 114ft. long by 94ft. wide, the floor being sunk below Inge Street to the basement level, and so arranged that the centre may be used as a circus arena. The stage, 36ft. wide by 26ft. high and 16ft. deep, will face Inge Street side, and in addition to a spacious promenade running completely round the floor, there will be a balcony extending along three sides of the building, and terminating close to the proscenium. There will be three entrances in Inge Street and another—by means of a basement corridor running under the Assembly Rooms—from Hurst Street. The floor is to be so constructed that, if necessary, the circus base may be instantaneously lowered and filled with water, as is done at the Tower Circus, at Blackpool. The building will be of red brick and terra-cotta, and the design in keeping with the style of the Assembly Rooms; whilst the internal decorations and fittings will be of elegant character. The architect is Mr. F. W. Lloyd, of Birmingham.

BOURNE.—The chancel of Bourne Abbey Church has been re-opened. Mr. J. C. Traylen, Stamford, was the architect. The chancel was not part of the original building, being a solidly ugly utilitarian post Reformation addendum. The depressing features have been redeemed by the light and beautiful painting of the roof, by a thorough interior renovation, by the addition of oak choir stalls and carved screen, and handsome furniture. The screen is a fine specimen of English oak tracery work, and it bears emblems of the four evangelists. The builders' work has been carried out by Messrs. Roberts Brothers, Stamford.

DUNDEE.—The public washhouses in Guthrie Street, the first of a series of such conveniences which the Town Council of Dundee propose to erect in various districts of the city, were opened recently. The building is situated immediately to the north and adjoining the public baths in Guthrie Street. The entrance is to the west of the door of the baths, access being gained to the washhouse by means of a sloping corridor. By this arrangement the office is situated between the entrances to the two departments, so that the clerk is able to attend to both at the same time. The washhouse is a lofty chamber, measuring 57ft. in length and 45ft. in breadth, and, like the corridor, is paved with granolithic. The roof is supported on elegant iron couples, and the whole chamber is lighted by eight roof lights and a large window in the gable facing Horsecwater Wynd. Washing is carried on in twenty-four stalls, arranged in four transverse lines, with a large drying chamber between each two rows. The stalls are 6ft. long and 5ft. broad, and are separated from each other by iron partitions 5ft. 6in. high. The designs were prepared by Mr. Mackison, the Burgh engineer, and the heating arrangements have had the attention of Mr. Walter M'Gregor, superintendent of the Baths. Mr. Allen acted as clerk of works. The cost of the establishment has been £1700, and the principal contractors were: Mason, David Crichton; joiners, Gove and Cameron; slaters, Ramsay and Reid; plumbers, John Crichton and Sons; plaster and granolithic work, Reoch and Kilgour; painters, Petrie and Greig; iron work, John Jack; engineers, Cooper and Greig; mangles and wringers, G. H. Nicholl and Co.

EXMOUTH.—The new church of All Saints, in the parish of Withycombe Raleigh, Exmouth, in style is Gothic, and built of limestone with Bath-stone dressings. It consists of chancel, nave, side aisles, transepts, side chapel, baptistery, organ loft, clergy and choir vestries, and holds seating accommodation for 700 persons. On each side of the altar are inscriptions perpetuating the memory of the Perring family.

HARWICH.—Dovercourt Church has just been re-opened, after restoration. The edifice is an ancient building of brick and rubble of the twelfth century. The architects for the restoration were Messrs. J. E. K. and J. P. Cutts. During the progress of the work several old and interesting architectural features have been brought to light. In the chancel it was found that the windows had at some period been altered in shape and design. Two small windows, east of the old chancel-screen, have been opened, having been only roughly filled in at the beginning of the present century. Whether these windows are leper windows, confessionals, or openings from which the Sanctus bell was rung, is still an undecided point with archaeologists. Just west of the chancel arch is another peculiar low window, which also was blocked up about 1811, and has now been re-opened. This may very possibly have had something to do with the rood which stood above it. Close to this window there is a piscina, pointing to the fact that there was an altar outside the screen as well as the one in the chancel. Immediately opposite, in the north wall, are the old stone steps leading to the rood-loft; and further down the church, one on either side, are the stone quoins of two Norman windows. There is an oak "poorman's box," bearing the date 1569, with two locks and two keys. With regard to the extent of the renovation, the roof has been re-tiled, and the stone gable and cross at the east end renewed. The ceiling has been removed, and the old oak timbers of the roof uncovered. A false wall of lath and plaster, which ran the whole length of the church, from east to west on both sides of the interior, has been removed. Three new windows have been opened up and filled with stained glass. The old stone steps leading up in the thickness of the wall to the rood-screen have been revealed, and the stone quoins of the windows have been restored. The porch has been re-roofed and also the vestry, and the only thing that now remains to be done is the refacing of the old tower.

HONINGHAM.—The Church of Honingham has undergone very complete restoration, the work having been carried out by the Hon. A. E. Fellowes, M.P., as a memorial of the Jubilee of the Queen. In the chancel a new oak roof of pretty design has been placed, the reredos has been heightened, and a new dais has been erected, while the walls have been coloured. In the nave the roof and walls have been coloured, and round the latter a dark dado has been painted. The whole church has been refloored, tiles being placed in the passages and wood blocks elsewhere. The old-fashioned deal seats have been replaced by open oak benches, but a few of the old benches have been retained. The steps of the pulpit have been remodelled, and a new heating apparatus has been supplied. The walls of the tower have been thoroughly repaired, and the lower portion of the structure has been converted into a choir vestry, while above an oak floor has been placed for the ringers. The porch, too, has been repaired, and the stonework and roof of the vestry have received attention. A new organ has been erected by Messrs. Norman and Beard, of Norwich. The restoration work has been carried out by Mr. Chapman, of Hanworth, under the direction of Mr. Herbert J. Green, architect, of Norwich.

IBSTOCK.—The Church of St. Denys, Ibstock, has been reopened after restoration of the chancel. The improvements effected are complementary to the restoration of the nave and wings undertaken and accomplished a few years ago. The alterations to the chancel include a new roof, floor, and eastern window;

four old windows that had been bricked up for 250 years have been opened out and renovated, and two leper windows have been restored. An organ chamber and a new vestry have been built, and the whole of the outside of the chancel has been re-pointed. Amongst other improvements are new choir stalls and altar rails. Mr. T. A. Wileman, Ibstock, was the builder.

LIVERPOOL.—A public hall is to be erected on a site in West Derby Road just beyond Emmanuel Church. The hall is to be handsomely decorated in Lombardic style. The material will be red brick, with terra-cotta dressings. The hall is to accommodate 6000 persons in the body, with 1000 on the stage. There will be ample means of egress—sufficient, in fact, to empty the huge building of its 7000 occupants in three or four minutes. There is to be an arcade and thirty-six business shops along the frontages. The galleries of the great hall are to run over the shops, and separated from the premises below by a fireproof construction. Committee-rooms, ante-rooms, and all needful accessories will, of course, be provided. If the present plan is carried out in its entirety, there is to be also a smaller hall, capable of seating 700 or 800 people, in the basement, underneath the stage of the great hall. The roof of the small hall will be of fireproof and sound-proof construction, so that two entertainments may proceed simultaneously without inconvenience. The hall and shops are estimated to cost £60,000. Mr. W. Parslow, Grecian Chambers, Dale Street, is the architect.

MELTHAM.—The new town hall has just been opened. The walls are of rock-faced stone, with ashlar facings, and the style is semi-Gothic, in harmony with the opposite building—the Carlile Institute. The interior of the hall contains a large council-room, committee-room, ante-room, lavatories, collector's room, clerk's office, surveyor's room, four store-rooms, central hall, vestibule, and room for the heating apparatus. The decoration of the interior has been carried out by Mr. J. H. Stuttard, of Ramsden Street, Huddersfield. The council-room is, of course, the principal part of the building. The ceiling is of bold plaster enrichments, decorated in harmonious colours, and relieved in gold. The walls and frieze are of Tynecastle tapestry, with base border picked out in delicate tints of blue, red, and citron. The woodwork is decorated in enamel, edged with gold. The committee-room ceiling and cornices are in dead colours with stencil frieze, specially designed by Mr. Silber, of London. The walls are of imitation cheviot cloth, with dark brown Lincrusta Walton dado. The woodwork is of knotted oak with bonised moulding. The rest of the contractors are Messrs. J. Moorhouse and Sons, masons; Mr. J. M. Moorhouse, joiner; Mr. J. W. Kaye, plumber; Mr. J. Kilburn, ironwork; Mr. S. Wilkinson, for concrete; Mr. J. Hinchliff, outside painting—all of Meltham; Mr. W. E. Jowett, slater and plasterer; and Messrs. Calvert and Co., heating apparatus—both of Huddersfield. The architect of the building is Mr. Wm. Carter, the Clerk to the Council.

NEWCASTLE-UNDER-LYME.—A new institute has been erected at Newcastle-under-Lyme. It is a building of red brick, with stone dressings, the design being late Gothic. There is a low tower over the main entrance, and the principal windows are filled with leaded lights. The large hall or church-room is 63ft. by 28ft. and 25ft. high to the principals. It is fitted with platform and moveable seats, and will also be used as a gymnasium. On the other side of the main corridor are a class-room 30ft. by 21ft., a reading-room 16ft. by 22ft., and a billiard-room 30ft. by 22ft. When required, these three rooms can be used together, being separated by sliding partitions. A smoke-room is situated upstairs, and a kitchen, heating chamber and lavatory accommodation are also provided. Messrs. R. Scrivener and Sons, of Hanley, have been the architects; and Mr. S. Wilton, jun., of Newcastle, the builder; Mr. E. Peake, of Fenton, putting in the heating apparatus. The total cost has been nearly £3000.

PAISLEY.—Plans of the new Eye Infirmary have been passed. The infirmary, which will be erected on a site on the Mansion House Road, Greenlaw, will be two storeys high, the kitchen, heating apparatus, &c., being accommodated in the basement. The ground floor will consist of waiting, doctors', and dark rooms, a dispensary, with separate entrance and retiring doors for outside patients, together with a male dormitory, dayroom, and bathroom. Provision is made on the upper floor for the female dormitory, dayroom, and bathroom, and two private wards, in addition to matron's, servants', and other rooms. In connection with each of the wards a verandah will be formed, in order to permit of patients having easy access to the fresh air.

PORTSMOUTH.—A new wing has been added to the Royal Sailors' Home. The new building has an area of 130ft. by 50ft., with frontages to Queen Street of 32ft. and to Hanover Street of 130ft. In the basement is the bowling alley. It contains three alleys, and is 80ft. long by 20ft., with a maple bowling floor. There is also a large bicycle store in the basement. All the rooms in the new wing are lined from floor to ceiling with glazed bricks, the dados being light grey and the walls above being cream colour. On the street level is the ground floor, containing a well-lighted and ventilated reading-room 37ft. by 26ft., with a floor of oak blocks. The old kitchen has been absorbed in the new, which now measures 32ft. by 24ft. The dining and sleeping apartments of the male servants of the establishment are also on the ground floor. On the first, second, and third floors are 160 new cabins with lavatories on each floor. The cabin framing is varnished, and each cabin floor is covered with linoleum, and every precaution has been taken to cleanliness; the dormitories are well lighted and great attention has been paid to the ventilation and to the supply of fire escapes. The architect is Mr. H. C. Vernon-Inkpen. The builder was Mr. John Croad; and the clerk of works, Mr. A. J. Lewis.

SHEFFIELD.—A new Wesleyan Chapel has been erected in Dearne Street, Brightside Village. The foundation-stones of the chapel were laid in March last year, and the building has cost about £2255. The edifice has been erected from the designs of Mr. W. J. Hale. Stone is the material used. The contractors were Messrs. Powell and Son, and the heating apparatus was laid down by Messrs. W. Truswell and Sons.

SWINDON.—A new theatre has been opened at Swindon. In arranging the seats a gradient has been supplied, which gives everyone a view of the stage, and the acoustic properties appear to be equally satisfactory. The upper circle accommodation is particularly good in this respect, and, in addition, there is a commodious promenade. The theatre, which is to be called the Queen's, is well situated, with the principal elevations fronting Clarence Street and Groundwell Road. It has been erected from designs prepared by Messrs. R. Milverton Drake and Pizey, architects, Bristol, who have adopted the free Renaissance style, which will add to the architectural attractions of Swindon, the materials used being red brick with freestone and Reading rubber facings. The interior is of a pleasing design in Italian Renaissance. The large saucer ceiling over the grand circle is 40ft. in diameter, constructed in steel, and richly plastered, with a Stott's sunburner in the centre. The proscenium opening, boxes, circle front, and other decorative works are all in harmony with the ceiling and in accordance with the architects' designs, treated in cream and gold, with gold and old gold and blue hangings to boxes and upholstery of seats. The building, which will accommodate about 1600, is 110ft. by 90ft. wide. Ample ventilation is supplied, and a water curtain is also provided to shut off the stage from the auditorium in the event of fire. The contractor was Mr. Charles Williams, of New Swindon. The lighting and fire appliances have been supplied and fitted by Mr. A. S. Scull.

Under Discussion.

GLASGOW ARCHITECTURAL ASSOCIATION.

At the usual monthly meeting, the President, Mr. W. T. Conner, in the chair, Mr. J. A. Williamson, as delegate from the Edinburgh Architectural Society, gave his lecture on "The Wren School," which we described last week.

ABERDEEN SOCIETY OF ARCHITECTS.

The annual meeting of the Aberdeen Society of Architects was held on the 1st inst., when the following office bearers were elected:—President, Mr. James Souttar; vice-president, Mr. Arthur Clyne; hon. secretary and treasurer, Mr. John Rust; members of council, Mr. Wm. Kelly, Mr. A. Marshall Mackenzie, Mr. A. H. L. Mackinnon, Mr. George Watt, and Mr. R. G. Wilson.

EDINBURGH ARCHITECTURAL SOCIETY.

The Edinburgh Architectural Society met on the 2nd inst.—the president, Mr. W. Nicholson Cumming, in the chair—when Mr. A. Hunter Crawford, representing the Edinburgh Architectural Association, delivered a lecture on "Steam-heating." The lecturer adopted the plan of discussing the solution of an actual problem before his audience, illustrating the subject by sketches and a working model, showing a combined method of steam-heating and domestic hot water supply.

THE HISTORY OF ARCHITECTURE.

Mr. Cecil Orr, lecturing before the Architectural Society of Ireland on "The History of Architecture," first showed the origin of design from natural objects, and the rise of Greek Architecture from Egyptian and Assyrian work. He pointed out that Roman Architecture was a development of Greek work, united to the Architecture which they had got from the Etruscans. He next showed how Constantine the Great had transplanted the Roman arts to Constantinople, his new capital, where they became united with the Eastern work of the Sassanians and Phœnicians. Here Mr. Orr broke off his treatment of European work, with the remark that the native work of Ireland was derived not from the Byzantine School, but from the common origin with the Phœnicians through Carthage. He then dealt at some length with Moorish Architecture.

NOTABLE BUILDINGS IN FRANCE.

Lecturing on "Some Notable Buildings in France," at the Carpenters' Hall, London Wall, Professor T. Roger Smith selected most of his subjects from the North of France, showing lantern views of examples of cathedral and other buildings at Caen, Rouen, Mont St. Michel, Amiens, Bourges, Rheims, Paris, &c. Referring to the church of St. Owen, at Rouen, he said it was the most beautiful and most perfect in the whole of France, having a wonderful effect in height, and an interior of very lofty proportions. The lecturer wound up with a peep at Paris. Referring to Notre Dame, he said on the front door the ironwork on the woodwork was so skilfully hammered that the man who did it was thought to have been possessed by the devil, and was executed. The prison of the Conciergerie, where Marie Antoinette was imprisoned; the Tuileries, the old and the new Hotel de Ville, the Madeline, the Opera House, and other notable Parisian buildings were afterwards depicted.

"FURNITURE: PAST AND PRESENT."

At the fourth meeting of the session of the Auctioneers' Institute, held in the Lecture Hall, Chancery Lane, London, Mr. W. Roland Peck, of Messrs. Hampton and Sons, London, read a paper upon "Furniture: Past and

THE Roman Catholic Cathedral of St. John, Savannah, together with the bishop's residence adjacent, has been practically destroyed by fire. The damage is estimated at a quarter of a million dollars. The cathedral was the largest and most costly Roman cathedral in the South.

Trade and Craft.

MILNE'S ANTI-DOWN DRAUGHT CHIMNEY TOP.
 "A certain cure for a smoky chimney" must indeed come as a boon and a blessing to men. Ever since the days when the use of chimneys first superseded the more primitive method of getting rid of smoke by means of a hole in the roof, man's quest after the "certain cure," which Mr. E. P. Milne, of 101, Melody Road, Wandsworth Common, S.W., now announces, has never ceased. Certainly the anti-draught chimney top in question has many merits to recommend it. Its action being syphonic, the main flue is not affected by any atmospheric depression, and the up-draught is very consider-

ably increased. The arrangement of the top has been very carefully considered artistically, and also with regard to the arrangement of the interior, so as to allow of its being easily cleaned by the chimney sweep. Painted terra-cotta colour, Milne's chimney top harmonises well with a brick or stone building, where the usual metal cowl would be an eyesore. The system has been tried under almost every condition of down draught with unvarying success.

W. DUNCAN TUCKER.

Horticultural accessories of various descriptions often come within the purview of the architect. An improved portable wall fruit tree coping for sheltering the buds and blossoms of wall trees from frosts, which has been put on the market by Mr. W. Duncan Tucker, F.R.H.S., of Lawrence Road, Tottenham, should rank high among the protectors of the kind. It fulfils its purpose admirably. It is a simple structure of portable glazed sashes and iron brackets, the latter being fastened to the wall by bolts. The glazed lights are 6ft. 7in. in length, and slide in grooves in the iron brackets, being firmly held in place by wedges. The lights can be removed in a few moments, an advantage during a shower of rain. Some neat designs for conservatories are given in Mr. Tucker's catalogue, and in each case they are constructed in harmony with the style of architecture of the building which they adjoin. Among other designs illustrated are a three-quarter span range, erected at Bromley, a span-roofed greenhouse with the latest improvements, and a conservatory of striking design, with lantern and transept roof and with the transoms ornamented by the introduction of lead light, glazed with cathedral tinted glass. Mr. Tucker is up-to-date with horticultural requisites of every kind.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BARKING.—For erecting shops at Barking. Mr. F. S. Hammond, architect:—
 Lark and Son ... £5,096 Johnson ... £4,992
 Shurmer ... 5,015 Gibb ... 4,400
BURNLEY.—For the construction of sewer, for the Rural District Council, Mr. S. Edmondson, District Surveyor, 18, Nicholas-street, Burnley:—
 Smith & Biscock £2,414 11 2 Thos. Horrocks ... £1,718 6 8
 E. Cheetham ... 1,957 0 0 Edmund Heap ... 1,660 15 0
 J. & G. Duxbury 1,841 13 3 Joseph Wadge ... 1,642 1 0
 Emanuel Riley ... 1,828 3 4 Metcalfe & Dinsdale ... 1,561 1 5
 T. Dent & Sons ... 1,821 16 9 J. & J. Lee ... 1,557 9 0
 G. Read & Son ... 1,508 11 4 J. M. Hawley, Colne ... 1,320 4 0
 H. Fotherby & Son 1,304 0 9
 Smith Bros. ... 1,747 6 3
 *Accepted.

HENDON.—For the construction of artificial filter, pump-chamber, concrete carriers, etc., at the Sewage Outfall Works, for the Urban District Council of Hendon. Mr. S. Slater Grimley, engineer:—

	Above schedule for extras.	Per cent.
M. S. Kitteringham	20	£1,585 16 3
C. Ford	25	1,521 18 0
Allen Bros.	15	1,355 19 4
R. Ballard, Ltd., Child's Hill, N.W.*	10	1,241 14 10
T. Adams	20	1,312 0 8
H. Lee	at the schedule	1,318 17 7

*Accepted.
KIRKCALDY (N.B.).—For the erection of six shops and fifteen houses, High-street, for the Whitehouse Estates Company. Mr. Robt. Little, architect, 4, St. Brycedale-avenue, Kirkcaldy:—

Masonry.—Geo. Smith and Son	£4,150 0 0
Joinery.—Thos. Scott and Co.	2,576 0 0
Plumbing.—Jas. Johnston	985 12 6
Slating.—Currie and Cant.	148 2 0
Plastering.—Wm. Ure	516 18 0
Ironwork.—Barnet & Morton	633 6 6

LONDON.—For electric light wiring of the Abbey Mansions, North Block, Victoria-street, S.W. Mr. Morgan Williams, consulting engineer, 39, Victoria-street, S.W. Mr. Charles J. C. Pawley, architect, 66, Victoria-st., S.W.:—
 Estimated total for tenders No. 1 and No. 2, with branch wiring for 610, 3/22 S.W. (4) points.

Electrical and General Engineering Co.	£1,656 0 0	Laing, Wharton, & Down	2,991 9 0
Hill, Giffins, and Co.	1,342 14 0	Warburg, Dymond, and Co.	968 0 0
H. M. Leaf	1,147 10 0	Belshaw and Co.	909 15 0
Drake & Gorham	1,095 0 0	C. A. Hemingway	838 12 0
Townsend, Tampion, & Makovski	1,046 2 6		

LONDON.—For alterations and additions at Albany-street Police Station, for the Receiver for the Metropolitan Police District. Mr. J. Dixon Butler, architect. Quantities by Mr. W. H. Thurgood:—
 Chessum and Sons ... £6,459 Scrivener and Co. ... £5,595
 Holloway Bros. ... 6,350 Higgs and Hill ... 5,594
 Willmott and Sons ... 6,067 Perry and Co. ... 5,500
 Sidney Hart ... 5,945 J. O. Richardson ... 5,555
 Grover and Sons ... 5,916 Lathey Bros. ... 5,480
 T. Parker ... 5,839 Lascelles and Co. ... 5,326
 Lawrence and Son ... 5,689

LONDON.—For the enlargement of the Battersea Fire station, for the London County Council:—
 Marchant & Hirst £6,195 0 0 Stimpson and Co. ... £5,170 0
 J. N. Try ... 5,337 10 11 C. F. Kearley ... 4,895 0
LONDON.—For the enlargement of the Hampstead fire station, for the London County Council:—
 R. A. Verbury & W. Whiteley ... £4,066 11 7
 Sons ... 25,243 0 0 F. Gough & Co. ... 4,854 0 0
 J. N. Try ... 5,109 10 7

LONDON.—For the reconstruction of the Holborn branch of the Fleet sewer between Gray's Inn-road and Southampton-street, for the London County Council:—
 J. H. Neave ... £14,464 4 3 J. Dickson ... £13,245 3 1
 T. Adams ... 18,762 J. Mowlem & Co. ... 10,883 10 2
 Pedretti and Co. ... 19,311 16 8 E. Iles ... 10,395 15 0
 F. A. Jackson & Son, Limited ... 13,299 5 9 C. W. Killingback and Co.* ... 9,978 18 5
 *Accepted.

LONDON.—For the erection of a block of school buildings at Goodall-road, Leyton, E., for the Leyton School Board. Mr. William Jacques, Architect to the Board. Quantities by Messrs. R. L. Curtis and Sons:—
 J. Gately ... £23,995 Reed and Son ... £20,217
 Perry and Co. ... 21,560 G. Sharpe ... 19,967
 S. J. Scott ... 21,531 Gregar and Son ... 19,283
 Stimpson and Co. ... 20,967 F. J. Coxhead* ... 18,996
 Kirk and Randall ... 20,830
 *Accepted subject to the approval of the Education Department.

MACCLESFIELD.—For the execution of sewerage works, Poynton, for the Rural District Council. Mr. J. Thorpe, surveyor, 19, King Edward-street, Macclesfield. Quantities by surveyor:—
 T. and W. Meadows ... £5,585 A. Taylor ... £4,475
 W. Underwood & Bros. ... 5,113 J. Randall ... 4,415
 A. Kellett ... 4,782 F. Barke, Stoke-on-Trent* ... 4,076
 M. Hall and Sons ... 4,761
 J. Slinger and Sons ... 4,599
 *Accepted.

PRESTON.—For erecting a new school, and for extensions to present buildings, Royal Cross School. Messrs. Sames and Green, architects, 65, Northgate, Blackburn:—
 M. Shorrocks ... £3,570 J. Christian, Preston* ... £3,450
 *Accepted.

RUSHDEN.—For conversion of premises into shops and offices, for Mr. E. Claridge, Rushden. Messrs. Mosley and Anderson, architects and surveyors, Goodyear-chambers, Northampton and Finedon. Quantities by the architects:—
 R. Cosford ... £415 0 R. Marriott ... £235 10
 Whittington & Tomlin 379 0 H. Sparrow ... 355 0
 J. Willmott, jun. ... 375 0 Hacksley Bros., Well-
 T. Willmott ... 370 0 ingborough* ... 360 0
 T. Swindall ... 366 10
 *Accepted.

RUSHDEN (Northants).—For the erection of a villa residence, Kimbolton-road, for Miss K. Smith. Mr. H. Adnitt, architect and surveyor, High-street, Rushden. Quantities by the architect:—
 R. Marriott, jun. (accepted on a schedule) ... £650

RUSHDEN (Northants).—Accepted for the erection of a shoe factory in Glassbrook-road, for Mr. W. Hewitt. Mr. H. Adnitt, architect and surveyor, High-street, Rushden. Quantities by the architect:—
 T. Willmott, jun. ... £277 10s.

RUSHDEN (Northants).—For the erection of a villa residence, Fighles-terrace, for Mr. H. Bull. Mr. H. Adnitt, architect and surveyor, High-street, Rushden. Quantities by the architect:—
 T. Willmott, jun. (accepted on a schedule) ... £1,399

RUSHDEN (Northants).—Accepted for the erect of a villa residence in Park-road, for Mr. F. Corby. Mr. H. Adnitt, architect, High-street, Rushden. Quantities by the architect:—
 Robt. Marriott, Rushden ... £75

ST. ALBANS.—For the erection of villa, Actna-roa, for Mrs. MacLarty. Mr. Percival C. Blow, architect, 7, London-road, St. Albans:—
 J. and W. Savage ... £500 Bushell* ... 254
 E. Dunham ... 468
 *Accepted, subject to slight modification.

SEVENOAKS.—For erecting a Drill Hall, outbuildings, lavatories, drainage, and cottage, for the "G" company, 1st Vol. Batt. R.W. Kent Regiment. Mr. Thos. Potter, architect, 47, London-road, Sevenoaks:—

An Architectural Causerie.

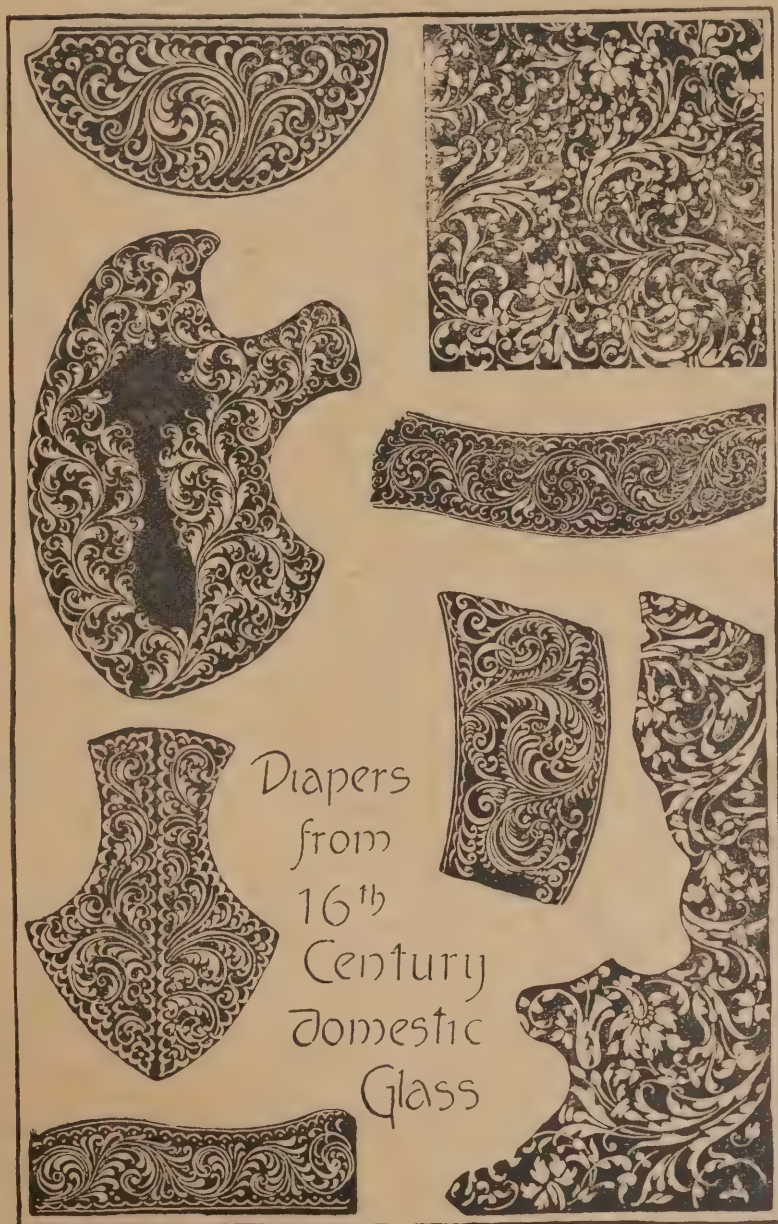

The Dorking "Fowl."

ONE is inclined to believe that since the term "Dorking Fowl" has so readily

spread from the domain of Zoology, and grown familiar to the public lip, so will the term *Dorking Competition* one day escape the bounds of architectural history to find just such another popular notoriety as "French leave," and serve as a cant phrase to designate a match, a contest, or a trial of skill which is no reality at all, but a humbug and a sham. In Architecture, however, *Dorking Competition* will always find a more exact interpretation than that granted it by the public, very much in the same way as "Dorking Fowl," which has a precise and definite meaning to the naturalist and poultry fancier, is in general used merely to indicate a fowl more largely imbued than ordinary with the air of fuddled dignity which characterises the bird. On referring to the books, one learns that a Dorking fowl is "one of a breed of large-bodied domestic fowls, having five toes, or the hind toe double. There are several strains, as the *white*, *grey*, and *silver-grey*. They are esteemed for the table." Upon this model, and in absence of any authority, one has ventured a definition of *Dorking Competition* as follows: "One of a large breed of foul public competitions, having only five or six designs submitted to the assessor, and the face of the committee double. There are several degrees, as the *almost white*, the *distinctly shady*, and the *downright dirty*. They are esteemed for copy." The late Dorking Workhouse Infirmary competition, which has provoked one to the above remarks, has duly brought its crop of protests; and a crop that is more than warranted by the facts. But a protest is the plaint of the underling; the protest of the strong is by way of threat. One is puzzled to conceive in what sort of regard the public hold the status of the Profession when, twenty times in a year, a half-dozen of rural shopkeepers joined in committee can reduce it to a state of protest. One conceives that such a ludicrous disproportion exists nowhere in the scheme of Nature; it has been left for civilization and architects to produce the monstrosity. In the present case, it would seem strange if the competitors in combination could not find some redress at law, if they chose to bestir themselves. The story is immense, even in the annals of "competitions." The conditions stated that a professional assessor would be appointed; and that this explicit statement was a strong inducement to competition is established by the fact that, in spite of the special and technical nature of the subject, no less than 39 sets of designs were submitted. After the drawings had been sent in, there came the ominous pause: The Guardians must have been exercising themselves consummately as to a scheme which should enable them to employ an assessor, and yet retain the 'nice-pretty' design they had set their hearts on. One sympathises. The usual method of frankly setting the assessor at the designs and chancing it, leaving it open to have a new

competition or set aside his award should he not choose aright, seems to have struck them as a bit hackneyed and stale. One appreciates their fine feeling. They probably made thorough enquiries, and on learning that the usual attitude of competing architects under the processes of bamboozle was one of supine apathy relieved only by a few puerile whimperings of protest, decided to venture on an original exploit of their own, and create a precedent for brother Guardians in other parts of the country. One admires

justice and assume that their taste in Architecture did not mislead them, and that their selection was as much a matter of chance as though it had been made by lottery. This means that the chance that the first design would be included in the ten selected by the Guardians is but as one to four against it; upon the most liberal computation it is four times more probable that the assessor never saw the first design than that he made his award to it. The significance of this action of the Guardians may be emphasised as

EXAMPLES OF SCRATCHING OUT.

(From Lewis F. Day's "Windows: A Book about Stained and Painted Glass." By kind permission of the Publisher, B. T. Batsford.)

their originality and daring. After a protracted sitting, the Guardians arose, blew their noses, selected ten 'nice-pretty' designs and set them aside for future assessment. Now, from knowledge of how this particular Board of Guardians is precisely constituted, one holds it fair to conclude that the Guardians, in selecting one from every four designs, would be nearly certain, unless they made a great blunder, to omit the first design (i.e., the design the assessor would have chosen on a view of the whole thirty-nine), because they would choose what was meretricious, superficial, and trivial in character; but one will do their case full

follows: If there had been eight sets of drawings submitted, instead of thirty-nine, and the Guardians had desired to pervert and direct the choice of the assessor to a proportionate extent, they would have abstracted but *two* for him to adjudicate upon; if four had been the number of competing designs, they would have selected one. This last proposition may seem puzzling, but it is none the less true; and illustrates the exact value of the promise of an assessor as fulfilled by the Guardians of the Dorking Union. If this is not a "Dorking Competition" one really does not know what is.

B. C.

STILL another architectural competition calling for comment! This time the action of the play is in Hampshire; the Eastleigh Urban District Council is the "villain" of the piece, which, apart from the triteness of this kind of entertainment nowadays, seems to lose in interest through a lamentable lack of the comedy element. The facts are very simple. The Eastleigh Urban District Council invite designs for public offices, &c., and the drawings are sent in on February 7th. Two days later—i.e., on the 9th—printed letters announcing the result of the competition are sent to the competitors, and on the 10th the drawings are returned and delivered in London. Herein the Eastleigh Urban District Council has displayed exemplary promptitude. The members deserve credit for the benevolent feelings which induced this speedy action, for they were no doubt prompted by a desire to relieve the suspense of such youthful aspirants as ranked among the competitors. In their hurry, the District Council, so far as we can ascertain to the contrary, omitted to call in an assessor—an omission which, under the circumstances, might lead the suspiciously-inclined to doubt their motives and strict integrity. It is true the Council did not promise, in so many words, to appoint an assessor, but in the conditions they stated that they would "probably" call in such expert assistance, and added: "Any attempt to unduly influence the decision of any assessor will disqualify a competitor." This was holding out a hope which the local authority found inconvenient—or undesirable—to fulfil. Perhaps the wise men of Eastleigh eschewed the services of an assessor on the ground that he would be too deliberate; for in energy and "pushfulness" the local District Council comes second only to Mr. Chamberlain. There was one clear day—not taking into account the printing—in which to adjudicate upon the designs, and the Eastleigh Urban District Council rose to the occasion right manfully; they settled the whole business within the space of a few hours. In order the more to appreciate this feat, one would like to learn the precise number of drawings upon which these august councillors passed judgment. To seek to belittle their achievement, and to cast reflections on their integrity by suggesting a pre-conceived prejudice would be uncharitable. And so the palm must go to Eastleigh for having settled an architectural competition in record time. The occasion has called forth a reiteration of the suggestion that an edict should go forth from the Institute forbidding any member from competing where there is no definite undertaking to have a professional referee. Theoretically, this end is quite easy of attainment. It is but necessary to secure perfect unanimity on the point throughout the Institute ranks, and one of the prime causes of discontent in connection with architectural competitions would soon disappear. There is no immediate prospect of such an edict being issued by the Institute, however, and therefore the prospect of the establishment of an universal system of assessors is equally remote. Even were such a system established, there would still be unrest; the institution of juries to adjudicate in all architectural competitions would then be insisted on. H. C.

A New Conservative club is to be built at Nuneaton, at the corner of Bond Street and New Bridge Street, and not far from the London and North-Western Railway Station. The architect is Mr. Charles W. Smith, Grantham, and the contract has been secured by Mr. Thomas Smith, of Chilvers Coton, whose tender amounted to £5126.

EXAMPLES OF OLD FURNITURE.

By A. E. CHANCELLOR.

A REPUBLICATION of drawings which have already appeared in the Building News. For the purpose of reproduction in a rapidly-printed journal they are very good, but show too much sameness of execution and effect to satisfactorily express the differences of style and workmanship in the very different periods illustrated, now that they are republished in book form; for the manipulation which gives the effect of a sixteenth century oak cabinet is quite insufficient to render the much greater delicacy of a Louis Seize commode. Most of the drawings appear to have been made more or less in a journalistic fashion, that is to say, a visit has been paid to a sale room, or to a newly opened exhibition, for the purpose of seeing and reporting on what was most interesting there, and the result is that the objects selected have been chosen from among the most striking and eccentric examples rather than from those of the best design. Among the drawings of chairs, for instance, there are a few that are excellent in design, many that are quaint and strange, and several that are definitely objectionable. It is a pity that there are not more detail drawings, which would add much to the value of the book—pp. 4, 6, 13, 26, 30, and 36 exhaust the list—and a few sections and notes on the development of construction would have been acceptable. A considerable proportion of the plates show pieces of furniture which are of some historical interest, from the halls of the Vintners' Company, the Haberdashers, the Parish Clerks, the Carpenters', the Stationers', and the Charterhouse; also the fine chimney-piece from the palace at Bow, happily rescued and lately set up in the Museum at South Kensington. There are likewise an escritoire, said to have belonged to Dean Swift, the cradle of the Earl of Derwentwater, and an Italian cabinet formerly in the possession of Charles I., which figured in the background of Sir J. E. Millais' picture of "The Princess Elizabeth in the Tower," and now stands in the marble hall at Hatfield House. In turning over the pages, one is forcibly struck with the over elaboration of much of the carved oak work. Look, for instance, at the seventeenth century cabinets on pp. 33 and 39. The idea appears often to have been to plaster as much carving on the article as possible, without consideration of construction, the requirements of utility, or the spacing and focussing of the ornament. Look, again, at the pendants and projections on the chairs on p. 22, which seem to be stuck on for the purpose of being broken off or of catching in the dress, and at the settee on p. 10, with its ridiculous little ornaments in the centre of the front of each seat, and, worst of all, at the ornament so frequently used in Jacobean work, the half balusters planted on in every conceivable place, whether appropriate or not. On p. 12 is an example in which they form the centre ornaments of three round-headed panels. Another point to which exception might be taken is the over heaviness of proportion in the carved and turned legs and angle balusters in tables and buffets, and the want of proportion between the upper and lower portions of the latter and of the court cupboard, of which several specimens are given. But these latter objections do not apply to Mr. Chancellor's work, except in so far as they may show that in selecting his examples for illustration he has been scarcely fastidious enough. He says in his preface that his aim has been "to portray not only typical examples of any well defined period, but also unique specimens and uncommon varieties, which derive additional interest from some charm of singularity or freshness of idea." This aim has led him to give rather too large a space to eccentricities.

S. S. G.

ABBAY RUINS.

VANDALS AT WORK IN WALES.

IT is rumoured in antiquarian circles that a considerable portion of the remains of the famous Strata Florida Abbey, Cardiganshire, has been carted away to be used as material for the building of a new church in or near the village of Pontrhydfendigaid. Some ten years ago the ruins of the abbey, which then consisted of little more than the fine western doorway and some slight remains of walling at the eastern end of the edifice, were thoroughly and scientifically excavated by the efforts of the Cambrian Archaeological Association, under the personal superintendence of Mr. S. W. Williams, F.S.A., of Rhayader. The result of the operations then carried out showed that the abbey church, in the days of its glory, when the notables of ancient Wales assembled within its walls to swear allegiance to the son of the greatest Welsh Prince, Llewelyn ap Iorworth, was a building

SECOND ONLY IN BEAUTY AND MAGNITUDE to the magnificent pile of Bishop Peter de Leia at St. David's. It also threw considerable light upon the conventual arrangements of Welsh monastic houses. A large number of burials are recorded in the ancient Welsh chronicles to have taken place within the abbey, and it was evidently the favourite resting-place of the family of the founder. During the excavations several graves were found in the church and also in the chapter-house, and others were discovered outside the chapter-house, having small headstones carved in the beautiful spiral work that is characteristic of true Celtic Art. The eastern chapels, three in number, on each side of the great altar, were discovered in such a state of perfection that their ground features could be made out with ease. The east end of the church had been paved with glazed heraldic tiles, and as many of these as could be found entire were laid down in the chapels. The abbey ruins have proved a source of considerable attraction to visitors to Aberystwith, many hundreds finding their way to the remains of the famous Cardiganshire abbey in the course of the summer season. It will hardly be credited that someone has tampered considerably with the still remaining portions of the ancient abbey. Not only has a quantity of stone, which had been dug out from the fallen portions of the building during the excavations, been taken away, but, says the Western Daily Mail, we are informed that the walls of the chapter-house and other portions of the church, which in some places remained to the height of over 6ft., have been at least partially destroyed. The entire ruins are said to present a lamentably dishevelled appearance.

CONSIDERABLE INDIGNATION HAS BEEN EXCITED

in the neighbourhood, where the ruins of the most famous of Welsh Abbeys are regarded with pride, not, perhaps, unmingled with the feeling that they are also a source of profit. The attention of Lord Lisburne, the owner of the land upon which the abbey ruins are situated, has been directed to the matter, and his lordship's agent, Mr. Gardiner, of Wenallt, is understood to have taken it in hand. The officers of the Cambrian Archaeological Association have also been communicated with, but, as the Association does not possess a permanent habitation, it is difficult to bring the weight of its displeasure to bear in an immediate and effective manner. A meeting of the Committee formed some time ago with the view of preserving the ruins is to be held at Aberystwith during the present month, when it is intended to proceed to the abbey for a thorough inquiry into the extent of the destruction that has been wrought. The report that even a single stone of a building intimately connected with all that is proudest in the history of the Principality has been removed from its original position cannot but arouse the keenest feelings of indignation amongst Welshmen everywhere; but we venture to hope that the injury already done is not irreparable.

WINDOWS : *

A BOOK ABOUT STAINED AND
PAINTED GLASS.

BY LEWIS F. DAY.

A BOOK from the pen of Mr. Day upon any subject of which craftsmanship forms an important part, may be expected to contain full details of the mode of producing the effects proper to the material, and perhaps a little over-glorification of the tool and the lessons taught to the designer by practice in its use; and it is evident that when writing his book on "Windows," he has felt the usual bias impelling him, and has striven with all his might to be sternly impartial, and to see excellences in work which in his more enthusiastic moments he would condemn. At least, it is only in this way that the non-committal tone in which he speaks of some of the later picture windows can be explained, for he has made no secret of the extreme views which he holds on the treatment and selection of subject for windows of the richer sort.

The book appears to be designed mainly for the instruction of those who know little or nothing about "glass" in the technical sense, and to such people should be of very great use. It is divided into three sections, in the first of which the development of craftsmanship is traced from the earliest known examples to its final decadence; in the second design is treated similarly; while the third contains chapters upon various points not conveniently included in the other sections, among which is a good *resumé* of the characteristics distinguishing the styles, after studying which no one should make any great mistake, within certain limits, in judging the date of a window which interests him. This section also includes a suggestive chapter on "How to See Windows," in which the enormous difficulties with which the designer has to contend are hinted at incidentally, and it is shown how impossible it is that a window should look equally well at all times, however carefully it may have been considered and carried out, which should give pause to those who glibly condemn such work after one cursory glance. The arrangement of the matter necessitates a certain amount of repetition, and one is conscious of it when reading the book through, but it may be no disadvantage in a work intended to instruct.

A full account is given of the processes gone through in making and putting a window together, starting from the simplest sort of work, and the reasons are explained for so arranging the leads in the more complicated designs that the shapes of the individual pieces of glass should remain tolerably simple. There is, however, no mention of the necessity of also so arranging them that the strains may be equally distributed, which is quite as important, for the weight of a panel of stained glass is considerable, and, if this be not properly attended to, the durability of the work is much impaired. Stress is laid upon the superiority of pot-metal colour to colour obtained in other ways, and it is shown that even in comparatively late Renaissance times there were glass painters who understood how to use the "mosaic" of glass with excellent effect. A very probable reason is given for the frequent occurrence of diapers formed of small pieces in early glass—viz., that the imperfect methods of cutting resulted in great waste of material, which the craftsman thus sought to utilise, and not always successfully, the effect of the juxtaposition of small pieces of brilliant colours in producing a compound tint not having been understood.

The evolution of painting as distinct from glazing is described, and prominence is given to the temptation which besets all craftsmen, leading them to overvalue the conquest of difficulties, the triumph of technique often causing them to lose sight of the true goal; and one is glad to see a protest made against the doctrine of "Art for Art's sake," and a

recognition of the fact that subject is of considerable importance, which needs insisting upon nowadays.

The second part ends with a postscript on style in modern glass, addressed to the glass-worker and designer, which contains a great deal of sound sense, but in which the argument needs concentration. While acknowledging the necessity of study and intimate knowledge of old work in many styles, it pleads for what every true artist must strive

ALL SOULS' COLLEGE, OXFORD.

From Lewis F. Day's "Windows: A Book about Stained and Painted Glass."

for, that is, that all such material should be thoroughly digested by the designer, so that his work should not imitate so much in detail as be informed by the spirit which guided the old craftsmen, for his design should be in harmony with the building of which it forms part.

It may be laid down as an axiom by which to judge the possibilities of success in subject design for glass, that forms which are intelligible in silhouette, or can be expressed in outline, are admissible, but that anything which requires gradations of tone (in the naturalistic pictorial sense) to explain its shape is not suitable for that form of design. That is to say, that strong light and shade,

or violent fore-shortening, or aerial perspective, are out of place, though one may somewhat relax this last rule in domestic glass on a small scale. For the effect of a stained glass window depends, not upon powerful realisation of an incident, but upon so treating the subject that the space may be agreeably filled with patches of colour, simple or intricate in design according to the position, rich and dark or light and silvery according to the amount of light required to be admitted or shut out; and the designer must plan his work with full knowledge of all the conditions, recognising also that the scale of the building is a most important factor in determining the treatment required. Work torn from the surroundings for which it was calculated often looks coarse and heavy in a museum, especially when taken from a large building, while the glass which pleases the eye of the inexperienced beholder most, such as the delicate late Swiss glass, is absolutely ineffective at a distance.

In referring to the subject of canopies, which fill so important a space in ancient windows, Mr. Day expresses his disapproval of their use pretty strongly. His argument, briefly stated, amounts to this: That they are frequently disproportionately large, dwarfing the figures beneath them, and that they are bad because they are imitative of stonework, and, therefore, appear to block up again a space in the wall which has been opened for the purpose of giving light; and on page 184 he ejaculates: "What a strange thing it is in the history of ornament that the natural bias of the designer seems to be so irresistibly towards imitation! The man's first thought seems to be to make the thing he is doing look like something it is not!" This characteristic of man's mind runs through a great deal of his work, and is not only to be observed in ornamental design, but one may ask upon what design of any sort is to be founded if not upon imitation either of natural objects or of the work of his own hands? Imitation, limited by the conditions of the material, has always been the basis of ornamental design, and always will be; and in the matter of the canopies, he himself allows (on p. 315) that "the late Gothic canopy work does most effectually frame the pictures," and that "there is no denying, nor any desire to deny its admirable effect." If ornament replaced architectural forms, as he appears to desire, the objectionable imitation would still be present, just as it would be in the rest of the window, the whole of it being restrained by the conditions of design for glass. Mr. Day appears to think that the use of architectural forms in glass is due to the likings of the architect. One may suggest another reason, viz., that their introduction gives a sort of architectural flavour and framing to the subjects represented in the window, marrying it to the wall as it were; and to some designers, nowadays, there is a fascination in playing at architectural design in an irresponsible way, without fear of catastrophe, which probably moved the old designers as well, and may account for the dream canopies in the churches in Rouen and elsewhere in France, the windows of which are so beautifully filled with towering masses of luminous glass suggesting architectural design. The real object of the attack made upon canopies is explained a little lower, and every artist must sympathize with the endeavour to stamp out the "trade" canopy. But there are other trade expedients for cheapening the cost of glass, and Mr. Day's object would certainly not be attained by the substitution of ornamental work, or even of plain glazing.

It is held by many persons in the present day that designer and executant should be "one and indivisible," and it is assumed that it was under these conditions that the great works of the past which we so much admire were produced. This has not been proved, as Mr. Day allows, and it is more likely that each contractor had his assistants. It is of course essential that the designer should know thoroughly the capabilities of his material, and should be able to show his assistant exactly what he wants done if explanation is insufficient. It is also essential to success that

* "Windows: A Book about Stained and Painted Glass." By Lewis F. Day. Published by B. T. Batsford, 94, High Holborn, W.C.

the assistant should be in harmony with the designer and take pride in his part of the work; but there is always the danger, when there is but one hand and brain employed, that the dexterity of manipulation should lead the design, instead of the design taking advantage of the perfection of manipulation. Mr. Day says, when speaking of modes of design: "If you want all that glass can give in the way of colour, begin with the mosaic. If you want pictorial effect, think first of your painting. If you want to get both, balance the two considerations equally in your mind from the first. Only, to do that, you must be a master of your trade." And this last sentence is really the heart of the matter. A master of his trade will give due consideration to spacing and proportion of mass, line, and colour (and no one but a master can be successful in that most difficult part of design); he will take care to assist the architect's intention in arranging the lighting of his building by the effect of his work; he will supervise the choice of the glass to be used in each part of his window, if he does not actually choose each piece himself, he will draw his cartoons with knowledge of the effect to be produced by each part, calculating the difference produced in it by greater or less distance and by the different colours of the glass, and will correct and alter the painting, if necessary, to ensure success.

Glass is made now quite as beautiful in colour and texture as any to be found in ancient windows, and if the craftsman will be at the trouble of seeking it, and can induce his client to pay a proper price, there is no reason why the glories of the old cathedrals should not be emulated in the present day.

S. S. G.

PROFESSOR HERKOMER, R.A., has had the honour of submitting to Her Majesty at Buckingham Palace his picture of the Jubilee, entitled "The Guards' Cheer."

The contract for the erection of the Tottenham Higher Grade Schools, of which Mr. A. M. Butler, of 16, Finsbury Circus, is the architect, has been secured by Messrs. H. Knight and Son, of Tottenham.

The Nottingham Architectural Society is holding an exhibition of the principal prize drawings in connection with the R.I.B.A. recent competitions. The designs and drawings are arranged in the Castle Museum.

The enlargement of Tadcaster Parish Church by the pulling down and putting back of the north wall to the extent of 8ft. has been completed, at a cost of £1300. A five-light window has been inserted at the west end, and a leaden roof with open oak rafters takes the place of the old slated roof. The two vestries, which have been enlarged, are approached by oaken doors, on which is a carving representing the wise and foolish virgins, with traceried panels, designed by Mr. Thorman, and executed by Mr. G. W. Milburn, of York. The architects were Messrs. Bromet and Thorman.

THE STUDY OF ARCHITECTURE.

By PROFESSOR AITCHISON, R.A.

ADDRESSING the members of the Birmingham Architectural Association recently, Professor Aitchison said the first thing anyone who desired to become an architect should be sure of was that he had a natural gift for the work, and if he found that he had no taste for it, and that he had been mistaken in

own country. Architecture was pre-eminently a constructional Art, and consequently it was of the utmost importance that any man who wanted to become an architect should make himself sufficiently acquainted with the subject, so that he could build with satisfaction to himself and to those who used the edifice.

THE SCIENCE OF CONSTRUCTION

was statics, and it was necessary that every man who professed to be an architect should learn sufficiently of statics to be able to gauge the security of walls against the pressure of the wind, water, and earth, and even against the pressure of goods stowed against them that had an inclination to slide. He must know the pressure that was exercised by vaults, domes, and arches, and learn how those might be properly abutted, as well as understand how to prevent walls, piers, and columns becoming forced out of the vertical. Besides statics, they had to learn the force and strength of the different materials that were used. Unless a man knew the outlines of construction, he could hardly be called an architect, although he might be an admirable designer and planner. In planning it was important that each room, passage, and staircase should be as well adapted as possible to the uses to which it was to be put. The whole should be packed into as convenient a place as possible so that there might be no lost room, and the most frequented apartments should be conveniently situated. All public buildings should be well planned and striking or impressive to look upon. Architecture was the accretion of knowledge from the very earliest pre-historic time when any kind of building was put up. The great thing a man who could plan and construct ought to know was how to make the necessary portions of the building he was putting up tell the tale that they were required to tell. He was sorry to say that a great deal too little attention was paid to that matter in England, for they saw all kinds of incongruous ornaments and decorations put on all sorts of places. It was probably ten times more difficult to get a thing to look well that was simple than if it was ornamented.

GREAT ORNATENESS WAS A MISTAKE,

for it was never equal to the perfection that could be obtained by the greatest possible simplicity. He referred at some length to Classic Architecture, and said that in every architectural epoch of importance the world had known some buildings were erected that had been the admiration of succeeding generations, and now all persons of culture and wealth would as soon think of being ignorant of the great writers of their own countries as not to have seen Rome, Athens, Italy, and Florence. He did not know we were very much inferior in Gothic days in our works to the French, but he was afraid in his time there had not been so many great buildings put up that would bring persons to see them from all parts of the world.

FROM REGENSBURG, MUNICH MUSEUM.

(Re-published from Lewis F. Day's "Windows: A Book about Stained and Painted Glass.")

the passion, he should get his living in something else. The Profession of an architect was by no means a moneymaking profession, and if a person found he could not devote himself with all the energy he possessed to the study of Architecture, he might surely do something better than spoil the look of the face of his

RENAISSANCE MOSAIC GLASS.

(From Lewis F. Day's "Windows: A Book about Stained and Painted Glass.")

ARTS AND CRAFTS AT
LIVERPOOL.

SUPPLEMENTARY NOTES.

BY ERNEST RADFORD.

WE are able this week to supplement our notice of this Exhibition with a little additional matter. The illustrations held over are of Mr. Anning Bell's frieze, Mr. F. W. Pomeroy's plaster relief, Messrs. Rottmann and Co.'s "Peony Surf" frieze, and Mr. Temple Moore's church, St. Magnus, Bessingby, Yorks, Mr. Skipworth's church at Fulham, and two tile designs by

tainly not a purist in style, like Pugin and others of his persuasion, but we have taken to heart the advice Mr. Selwyn Image once gave in a lecture, which was that we should cultivate, whatever it cost, a Catholic appreciation of Art, selecting always the best, whether it owed its inspiration to Raphael, Rembrandt, Ruskin, or Wren, and whether that inspiration came from Paris or far Japan. The advantage of adopting this view is too obvious to be insisted upon. It allows us to fill our pages with illustrations drawn from all sources, and to give praise to the giver of good, whatever he aims at.

Referring again to a catalogue, we find that No. 651, by Mr. Christopher Whall, attracted attention; of architectural drawings by Mr. Seth-Smith the same may be said (Nos. 691,

of payment for space on the floor and the walls, and this, as is very well known, is against the rules of our Arts and Crafts Exhibition Society, wherein the opinion prevails that it is better to forego an annual exhibition than to have a gallery filled in this way.

Another and obvious cause is the issue of apparently unconditioned invitations to exhibitors whose names, in Liverpool at least, are attractive. To take but one instance: The exhibits of pottery ware by the Della Robbia Company Limited must amount in all to some hundreds. It is possible—for such is the taste of the day—that their worst is more marketable than the things we have praised, but there are markets and markets, and it is on all accounts desirable that this should be more exclusive than others. It is known in the

LIVERPOOL ARTS AND CRAFTS EXHIBITION. NEW CHURCH OF ST. ETHELDREDA, FULHAM.

Mr. Conrad Dressley. The mind must be exceptionally retentive that after its owner has quitted the exhibition building for good, has more than an indistinct recollection of what it contains of Art treasures. We are certain, however, that there are architectural drawings which would have been noticed if time had allowed; had space but been granted. It was thought, perhaps, that such illustrations as those of Mr. Skipworth's and Mr. Aumonier's works would speak for themselves, but we might at least have expressed an opinion that these, regarded as drawings, are unusually beautiful. Mr. Aumonier is cer-

733). Mr. Francis Bedford is represented by a great many; and other distinguished artists and architects at least by a few.

As Liverpool is now a city, it is meet that she should have her cathedral before very long, and Fancy has played freely with the idea. The result of her taking to Art has been that we have here a good many dream-pictures of buildings that may one day, Galatea-like, be converted by prayer into stone.

It was suggested that the probable cause of the poverty in one respect of this Exhibition is the admission of the trade on condition

place as the Art Gallery, and those who are responsible for it should be jealous of its good name.

THE preparation of Danbury Palace for the reception of its new owner is being briskly carried out. The decorative portion of the work has been entrusted to Messrs. Watts and Co., of Baker Street, London, and Mr. J. Feast, of Haddenham, is engaged in fitting up the place with the newest sanitary appliances. The cost of the whole work will be something like £4000.

BESSINGBY, YORKS. TEMPLE MOORE, ARCHITECT.

ON THE TRAINING OF ARCHITECTURAL STUDENTS.*

By FRANCIS H. NEWBERRY,
Head Master, The Glasgow School of Art.

(Continued from page 94.)

HOW should proportion, under the generic term of the orders, be taught? Let us first find out how it is taught, and thus proceed from facts as they are usually received, and if the result be wrong, set ourselves to find out a remedy. The student usually commences with copying an extremely

BAD EXAMPLE OF THE DORIC ORDER

from a flat copy; for be it here noted there does not exist to my knowledge any set of drawings outside books on the subject that can fitly be said to be good representations of the orders. The drawing in question displays the Doric order dissociated from its place in the building, generally without the entablature, and represented as a couple of converging lines cut off at the top and bottom by horizontal lines, and possessing, as a rule, the added wrong and dishonour of having the middle part of the shaft bodily removed just where the entasis commences. This maimed and disfigured picture he sets to work upon with compasses and T square, and, having made a copy of it, is supposed to have a knowledge of the Doric order. By equally easy treatments the Ionic and the Corinthian are added to his store with an equal accession of nonsense in the place of knowledge, and the student ends his course of the orders with a head full of disorders. He may possibly learn, when treating these classic specimens in the manner just mentioned, that the Doric was

THE FINISHED EXCELLENCE OF GREEK ARCHITECTURE

or some other equally vague and misleading statement. That if this be the finish, where was the beginning, seems rarely to occur to him. It would seem to be tacitly assumed that Greece was one day without the Doric order, and the sun rose over that country the next to find it embellished with, and in full possession of, that surpassingly excellent specimen of human thought, execution, and taste. Now, this is not training the student, but trading on his gullibility. Does it ever occur to him that Architecture was once with-

out even the use of column; that roughly hewn and without any shapely quality at first, it became moulded upon by the thoughts of succeeding ages, and shaped by the hands of generations of workmen, growing in beauty of contour and in exquisiteness of proportion at each successive stage of development, until

THE SNOWY WHITENESS OF THE PARTHENON

displayed its subtle proportions and incomparable workmanship to a world which wonders yet only to lose, in the vast majority of cases, the principles there worked out in the beauty of the outcome? I quote from Wornum a similar analogy in respect of our use of the Greek honeysuckle. "The ornament is simple and beautiful, but modern imitators overlooking its principles have comprehended only the detail, assumed it to be an imitation, and have called it the honeysuckle ornament. Instead, therefore, of grasping the source of a thousand ornaments

equally beautiful, they have acquired but one, and half the classic buildings of modern times are covered with honeysuckles; bringing the whole Art of Greece into disgrace for its monotony and formality,

while there is scarcely a weed in England that might not with equal skill have been substituted for the honeysuckle with perhaps equal effect." So is it with the orders. Recur to first principles logically, work them out, and a personal share in the glory of the result is ours. Instead of that our student grasps the ends, and loses sight of the means which brought them about. The work of the orders was not thus accomplished by the original designers.

GENIUS MUST EVER PRECEDE RULES,

not follow upon them. When a Greek would design, he piled mass upon mass, added line to line, cut contour from contour, touched necessity with the golden finger of invention, and left the result for other and later generations to come with note-book and foot-rule and mathematically demonstrate how it was all accomplished. The Greek as an artist perished, leaving behind him the monuments of his skill and genius, and the revival of a love of classic forms in the middle ages brought with it a host of workers in the note-book and foot-rule, who measured up and gravely calculated and came to the result that thus and thus the Greek did, and lo! the outcome. Far be it from me to deprecate in the slightest the work of those glorious architects, foremost among whom comes the honoured name of Vitruvius, and later Palladio, whose efforts and learned treatises have made Classic Architecture

OUR MOST PRECIOUS HEIRLOOM.

and whose exertions have made it possible for us here in the frozen North to realise by our productions the full beauty of the ancient temples and edifices whose ruins yet stud the sunny land of Greece, although our eyes may never have gazed upon the originals. To them we in Glasgow owe the fuel which

TEMPLE MOORE, ARCHITECT.

* A paper read before the Architectural Section of the Glasgow Philosophical Society.

LIVERPOOL EXHIBITION. NEST. PANEL OF TILES. DESIGNED BY CONRAD DRESSLER.

fired the genius of a Thomson, but were he still in our midst, he, I think, would be the first to confess that it was by no empty copying of dead details, but by a union of his thought with the thought of the Greek that his work was accomplished. And yet these details must be copied, but ever with the impression, that the whole which is created by a synthesis of these details, must ever be greater than the parts which analytically make up that whole, and that as all objects in Nature live because they obey great laws, so Greek Architecture will last as long as the world, because of its fulfilment of the laws and principles of beauty. This must be granted, and giving our student a note-book, I should at once start him to draw buildings. I would, however, provide him with a tape and foot rule afterwards—not while he is executing his drawing; and here comes in the good of his parallel and

CO-INCIDENT COURSE OF FIGURE DRAWING.

For I would make it a rigid rule that the student drew first and measured afterwards, and in this to follow in a building the same course of treatment he would adopt in drawing an antique figure. Who dreams of appraising the proportions of a figure with anything but the power of the eye? And if so, why cannot a building be treated in the same manner? Because, it may be retorted, how can you obtain proper plans and elevations unless you measure each part accurately? Or how can you instil the power of mathematical exactness into a man who never uses the means? It is the last thing I would care to do. Should he desire, after having made a correct drawing, to verify it, and to test it, and to set it down as an architectural production, because such is usually required, his doing so does not affect my position; for should he find the two drawings do not agree, it is less because he finds his measurements right, than that his drawing was wrong, and a weakness in his work found out. Did not the beauty of the Doric or Corinthian orders exist before it was found out that these shafts consisted in the perpendicular aggregation of a certain number of diameters? And do the

EXQUISITE PROPORTIONS OF A GREEK ANTIQUE

appeal to us with an added meaning because we are told it is seven and a half heads high?

But let us drive the matter straight home. An architect designing the proportions of an edifice to be constructed, draws and re-draws until such proportions please his eye and satisfy its demands. It is the work of his assistant to convert this artistic production into the mechanical necessities of a trade drawing, and all I would ask is that our student finding out, instead of creating proportions, adopt a similar course of treatment. I need not detail further. Having pointed out how I think proportion can best be learnt, it matters not whether the student copies the orders in this manner from some good book, or elects rather to do them from buildings where their proportions have been adequately realised; or, better still, leaves them alone till a later period. Draw first, and measure afterwards. I state the principle, and he should again attack a fillet or a temple, a Gothic leaf or a cathedral, with similar equanimity, for, be it remembered, that the proportions of an object, be it a crocket on a spire or a majestic cathedral, are best realised when, with every-day surroundings, they take their places in our common life and associations. The education of our student can never be complete without

A COURSE OF FIGURE DRAWING

from the antique and life, with its accompanying studies, anatomy, drapery, and figure composition. He will design best the proportions of what is lived in who best realises the form and proportions of him who inhabits, namely, man, the highest and most finished work of the great Architect. The application of such knowledge leads to figure composition, and, by its aid, the lines of the stiffly-posed Minerva in the centre of a Greek pediment may to him have a meaning equally with the curved lines of the dying Greek and Trojan soldiers in the angles, and the headless Ilyseus or Belvidere Torso, or the fragmentary Theseus all appeal to him as an embodiment of utility for architectural needs, combined with a beauty which excels those needs. Take, again, drapery. What study could be more beneficial to the student than this is, for realising the power and beauty of line, whether as the exponent of past and present action of the figure which it clothes, as in Greek Art, where motion was sought to be illustrated, or as in Christian sculpture, where, copied from the thick and coarse stuffs of the monkish dresses, hanging plumb down and sweeping the ground heavily, it became the exponent of a gravity and repose which, physical in its treatment, had yet a spirituality in its meaning. All these studies have in Architecture a mistress. To her the Greek gave the whole intellectuality of which he was capable, and for her the Christian wrought out and put into stone his highest symbolism; and a single glance at the figures as usually carved for, and applied to, our buildings to-day must convince us that not in vain will our student have learnt the use and abuse of sculpture in Architecture. Line plus proportion gives

MASS,

the last of the three divisions I made, and I cannot do better than preface the treatment of this, the greatest of the three studies, by a quotation from the "Lamp of Power," one of the Seven Lamps of Architecture as figuratively employed by Mr. Ruskin in his book under that name:—"And among the first habits that a young architect should learn is that of thinking in shadow, not looking at a design in its miserable liny skeleton, but conceiving it as it will be when the dawn lights it and the dusk leaves it; when its stones will be hot and its crannies cool; when lizards will bask in the one and the birds build in the other. Let him design with the sense of cold and heat upon him; let him cut out the shadows as men dig wells in unwatered plains; and lead along the lights as a founder does his hot metal; let him keep full command of both, and see that he knows how they fall and where they fade. His paper lines and proportions are of no value; all he has to do must be done by spaces of light and darkness, and his business is to see that the one is broad and bold enough not to be swallowed up by

twilight, and the other deep enough not to be dried like a shallow pool by the noon-day sun." Now

AN ARCHITECT IN HIS DESIGN

has this to consider, more than any other class of designers, that he has to deal with length, breadth, and depth. A painter's information, while it should embrace an abstruse knowledge of the four sides of a human figure, with all their various positions and foreshortenings, can but express itself by a display of usually not more than two sides of the figure he is designing, while the building by an architect has to present itself four-square to all the winds of Heaven. The closest analogy to his study of a building is met with in that of a sculptor's modelling of a figure, and this power of grasping mass can best be obtained by doing as does the sculptor, namely, by going through a course of modelling, and by these means to absolutely create a light and shade which may be all his own, as opposed to the imitation of a light and shade obtained by the execution of a drawing on a flat surface. Architecture in this respect may roughly be divided into two sections, one in which the forms are drawn with light upon darkness, as in Greek sculpture and pillars, and the other in which they are drawn with darkness upon light, as in early Gothic foliage. This phase of an architect's education was, I remember, strongly insisted upon by the late Mr. J. P. Sedding in the criticism of some modelled designs submitted to him by a class of students in Architecture at the Lambeth Technical School. The subject was an Italian doorhead. After emphasising the need in architectural students

IN GRASPING THE SOLIDITY

and not the superficiality of any subject they may be set to design, he pointed out that the picture of the result should ever accompany the progress. And this should be so. Students should be taught to imagine a building not as bathed in the artificial light of an architectural sun, which always casts its rays in angles of 45° from over the left shoulder, but to imagine their buildings as they are travelled across by the sun, and as having its own will upon their productions, and then to look at them again with the sun gone, and the skies grey and cold, and the rain pelting, or the snow falling, or the fog enwrapping their members, and to have pleasure in any of these

LIVERPOOL EXHIBITION. RABBIT. PANEL OF TILES. DESIGNED BY CONRAD DRESSLER.

imaginary aspects. "Architecture is the Art which so disposes and adorns the edifices raised by man for whatsoever uses that the sight of them contribute to his mental health, power, and pleasure." So says Mr. Ruskin again, who, I believe, does not usually take either health, power, or pleasure, mental or otherwise, in walking the streets of any of our large cities, when the rain is falling, or the fog is descending. Venice, in the sun, is his ideal.

THE HEAVEN OF A LIGHT AND SHADE

which architects strive after, but are dogmatically told they may not attain to. Still, the attempt is worth the making, although we are positively assured by that author, if his dictum carry any weight, that the dead past burdens too heavily the young giant of the present for us ever to hope to cast him off. Mr. Ruskin may be likened as sitting in the tree bearing the golden fruit that approaches and recedes from the lips of Tantalus. Here are some of his sentiments on Mass:—"What a contrast between the pitiful little pigeon holes which stand for doors in the east front of Salisbury, looking like entrances to a beehive or a wasp's nest, and the soaring arches and kingly crowning of the gates of Abbeville, Rouen, or Rheims, or the rock-hewn piers of Chartres, or the dark and vaulted porches and writhed pillars of Verona. Of domestic Architecture what need is there to speak? How small, how cramped, how poor, how miserable in its petty neatness is our best; how beneath the mark of attack, and the level of contempt, that which is common with us. What a strange sense of formalised deformity, of shrivelled precision, of starved accuracy, of minute misanthropy have we, as we leave even the rude streets of Picardy for

THE MARKET TOWNS OF KENT.

Until that street Architecture of ours is bettered, until we give it some size and boldness, until we give our windows recess and our walls thickness, I know not how we can blame our architects for their feebleness in more important work; their eyes are injured to narrowness and slightness. Can we expect them at a word to conceive and deal with breadth and solidity? They ought not to live in our cities: there is that in their miserable walls which bricks up to death man's imagination as surely as ever perished forsworn nun. An architect should live as little in cities as a painter. Send him to our hills, and let him study there what Nature understands by a buttress, and what by a dome. There was something in the old power of Architecture which it had from the recluse more than from the citizen. The buildings of which I have spoken with chief praise rose, indeed, out of the war of the piazza and above the fury of the populace: and heaven forbid that for such a cause we should ever have to lay a larger stone or rivet a firmer bar in our England! But we have other sources of power in the

IMAGERY OF OUR IRON COASTS

and azure hills; of power more pure nor less serene than that of the hermit spirit which once lighted with white lines of cloisters the glades of the Alpine pine, and raised into ordered spires the wild rocks of the Norman sea; which gave to the temple gate the depth and darkness of Elijah's Horeb cave, and lifted out of the populous city grey cliffs of lonely stone into the midst of sailing birds and silent air." Out of this mountain of seeming exaggeration comes forth the mouse of truth, and the architectural student can, by adding to his store of mental knowledge the manipulative skill of modelling, approach closer to that heaven-sent and born genius, the artist, who is, I fear, quietly assumed as being born educated, and therefore requiring none of the dull drudgery of the hard work that usually falls to the lot of less blest and worse endowed mortals. What the student should model matters little. He may make the study a vehicle for knowledge of

ARCHITECTURAL ORNAMENT AND FIGURE,

but it suffices to state that he obtains a power over the material so that he may roughly conceive a form, and with it a light and shade.

He may perfect his studies as time and opportunity permit, and if he fail to grasp a cathedral front he may realise the play of light and shade in a boss. With a knowledge of Line, Mass, and Proportion my subject may fitly end, but I would venture on your patience by briefly touching upon very debatable ground, namely, whether or not a student, whilst going through an academical course of instruction, should design? I answer the question in the affirmative, but would qualify it by stating that the design should be entered upon not as an end to, but as a means of knowledge, not objectively but subjectively. For I have found that work is ever the more heartily entered upon, and a greater good ensues, if the student have an end in view, as opposed to the desultory obtaining of information with a negative purpose. You will notice I have omitted all reference as to how the student is to obtain

A KNOWLEDGE OF THE VARIOUS STYLES,

which from Egyptian down to Victorian Gothic or Waterhousian Byzantine have claimed buildings as belonging to them. I would submit that a knowledge of these various styles and their epochs may be obtained by the student designing buildings and construction in any and every particular style, so that he may interestedly obtain a knowledge of and insight into their several peculiar qualities, their relevant constructions, their respective uses, and their particular ornaments or ornamentation. The restoration of ancient temples as done in many of our architectural schools forms a very good illustration of the idea I propound, and the architectural student, as subjective creator, may well, by his adaptation of the exigencies of any given style, fitly precede and lead up to the architect conceiving an original building in a style. This is what I instanced very early in this paper as accepting the past for the sake of the future. The styles are mines whose treasures are endless; and when it is grasped that the builder of Glasgow Cathedral did not invent Gothic, it will be seen that a high degree of celebrity may accrue to the artist who works on

THE MANNER OF HIS FOREFATHERS.

In reading the lives of the great dead artists, one cannot help being struck with the vast amount of knowledge, practical and applicable, they possessed of subjects which we are prone to consider as lying outside the relevant education of an architect. Thus Giotto's frescoes adorn the edifices of a city, one of whose chief architectural beauties is the tower he designed. Raphael's Pandolphini palace most beautifully realises our conception of architectural beauty and proportion, as do his frescoes fill us with the highest human conception of form. Brunelleschi, whose dome rivals Giotto's tower as the embellishment of the Cathedral at Florence, was a sculptor and a goldsmith. Leonardo da Vinci enumerates the making of designs of buildings for public or for private purposes and the executing of works in sculpture as among his accomplishments, and professes in painting to do, what can be done, as well as any man, be he who he may, assertions richly proved by his works yet among us; and in Michael Angelo we have combined the greatest powers of painter, sculptor, and architect in one as yet the possession of any single man that has lived among us. If I would seem to go out of my way in adducing these facts, which may justly not appear patent to the subject of this paper, I have done so purposely to throw light on a side issue which, though not distinctly relevant to its training, may yet have a great power for good both upon him and it, namely, his reading. Striving to be cultured men so that they may fitly take the places in the social life of the world which their powers entitle them to is not specially a quality which pertains only to architectural students, but a certain section of his spare time should be devoted to reading the lives of the great artists, so that his mind may be imbued by such means with their ideas and desires, while his pencil is busily employed with the practical study of their conceptions. Napoleon is credited with

the dictum, "Every soldier carries the bâton of a marshal in his knapsack." He, however, did not wait for the event, but worked for it. The drudgery of marching and counter-marching, and sleeping with the guns, had to be gone through, and gone through in earnest, before the bâton of the marshal was placed in his hands. But he knew its powers, and wielded them the better in the ordering of battalions and the placing of men, for that he had at one time carried the knapsack which figuratively held it. So the architect may command the dull stones of the earth to arrange themselves in ordered masses, and make beauty to live in undying splendour on our walls; may by his proportions lead the thoughts, and by his colours tinge the imagination of worshippers in a temple, of the earth earthly, so that they may catch a spiritual glimpse of a building not made with hands, and all this by a knowledge and use of powers of the bâton he wields—a piece of pencil.

KEYSTONES.

Two beautiful windows have been presented to Frankton Parish Church.

The parish church of Claydon has just been adorned by the insertion at the end of the south transept of a memorial window.

Mr. HENRY TEAGUE, who has occupied the position of water engineer at Lincoln for the last fifty years, has tendered his resignation to the Corporation.

In connection with the proposal to build a cottage hospital at Dundee, Mr. Lake Falconer has undertaken to supply designs and superintend the work of construction gratis.

Good progress has been made with the erection of the new Technical Schools at Devonport. It is expected that the Art Department will be ready for occupation in September.

The "kiosk" system does not commend itself to the Highway Committee of the Blackburn Corporation, who have declined to entertain an application for the erection of these structures in the streets.

It has been decided by the Perth School Board to erect a new school in place of the Central District School, with an entrance from High Street, at a cost of £7000, and capable of accommodating 700 pupils.

MR. WALTER HANSTOCK, architect, Leeds and Batley, was placed first in a limited competition for chapel and Sunday schools for the Methodist Free Church, Armley. The successful competitor will carry out the work.

GLENBORODALE CASTLE, so delightfully situated on the north shore of Loch Suinart, and built about forty years ago by Mr. Dalgleish, has been razed to the ground, and the site is being cleared for the new foundations.

A SITE has been secured in the Balham Road, with a frontage of 80ft. and a depth of 150ft., upon which Mr. W. G. R. Sprague will shortly erect a theatre. The house is to be named the Royal Duchess Theatre.

A CHAPEL has been added to St. Matthias's Church, Stoke Newington, as a memorial of the late William Henry Monk, Mus. Doc. The chapel is at the east end of the south aisle of the church. The altar cross has been enriched with some old family jewels.

THE statue of the late Judge Hughes will not be erected at Rugby until towards the end of the present year. The commission for the work has been entrusted to Mr. Brock, R.A. The cost of the statue, which amounts to £1000, has already been subscribed.

SHEERNESS Urban District Council has applied to the Local Government Board to sanction a loan of £13,700 for the construction of a new iron pier in place of the wooden structure which was built in 1833, and partially destroyed in the gale of November 29th.

THE new Board Schools at Bronyfael, Carnarvonshire, built from the designs of Mr. Rowland Ll. Jones, Carnarvon, at a cost of £6000, are situated at a high altitude among the Cambrian group of mountains, overlooking Carnarvon Bay and a vast expanse of country and are in this respect probably the highest schools in the kingdom.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
March 16th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slabs; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic utilities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

It would appear as if some of the expenditure of a million a year upon national Art education should be extended to the classes whose walk in life is considerably above that to which at present it is applied. We note, for instance, that the doors of the new house in Piccadilly, which the Isthmian Club have just taken, have actually been grained in imitation of goodness knows what kind of wood! We imagined that this style of Art was now only confined to the third class carriages of railway companies.

SINCE the memorial from architects and artists in favour of the retention and restoration of the Greyfriars Church was sent to the Aberdeen Town Council and to the University Court, the names of Mr. R. Rowand Anderson, LL.D., H.R.S.A., architect, Edinburgh, and Mr. Alfred Waterhouse, R.A., LL.D., London, have been added to the list of signatories. Dr. Anderson was the architect for the McEwan Edinburgh University Hall, and was engaged in the restoration of King's College, Aberdeen.

IN the course of a paper read before the Liverpool Architectural Society, Mr. F. E. P. Edwards drew attention to the fact that no permanent memorial exists in the city of Harvey Lonsdale Elmes, to whom we owe St. George's Hall. It is not unlikely that a movement will be made, sooner or later, to remove from Liverpool the reproach of the non-existence of such a recognition of the genius of Elmes. Of course, the suggestion may be made, as in the case of Christopher Wren and St. Paul's Cathedral, that St. George's Hall is the best monument of its designer; but surely something in the shape, say, of a tablet, should be placed in the building to bring continually to mind the personality of a great artist who died all too soon.

THE Royal Academy will shortly proceed to dispose of a Turner annuity of £50 a year to a necessitous artist. The eighty-eighth dinner of the Artists' Benevolent Fund, which took place a few days ago, showed how insufficient artistic co-operation is to meet all the demands of a benevolent nature which come before it, for the funds only allowed of thirty-five widows and six orphans being assisted. Mr. Prinsep, who presided, narrated some interesting facts to combat the popular idea that the pursuit of an artistic profession was no easy one; and he quoted instances from two of the most talented artists which the Victorian era has seen—namely, Leighton and Millais. Leighton's pictures were, to the end of his life, only the outcome of enormous and sustained labour. Millais, even in later years, was frequently so worried with his work that he had a good cry over it.

THE story of the celebrated Lowestoft china is most interestingly told by a writer in the Estates Gazette, on whose authority we learn that ceramic art at Lowestoft had quite a romantic origin. The earliest dated specimens of Lowestoft pottery, now so highly prized by connoisseurs, is 1762, and just prior to this year tradition says a Dutch sailor, sole survivor from a wreck off the east coast, was hospitably cared for by a Lowestoft gentleman. While his protégé was with him this gentleman took him to a meadow on his estate, where workmen who were digging a trench came to a bank of white earth. This the Dutchman at once recognised as the kind used in Holland by makers of earthenware and porcelain at Delft. The story goes on to relate how, as the result of this information, the fortunate landowner realised £10,000 in eighteen months from the sale of the white earth, and in 1756 porcelain works were established at Gunton Hall. A little later a factory was set up in Bell Lane, Lowestoft, where examples of porcelain were produced which, for the extreme minuteness and intricacy of pattern, beauty of finish, and nicety of pencilling, almost microscopic in character, far surpassed any contemporary ceramic work. Then a French artist was engaged, from whose hand came the exquisite floral patterns that adorned the Lowestoft ware, then chiefly turned out in the form of punch bowls and tea and coffee services. The Lowestoft works were closed in 1804 owing to the severe competition of the Staffordshire potters.

THE following is taken from Punch:—For architects.—Q. Why should the House of Lords always uphold the decisions of the Ecclesiastical Courts? A. Because it is only natural that the Court of Arches should be supported by its Piers.

SINCE last September the Church of St. Clement Danes in the Strand has been undergoing restoration, at the cost of the rector, who has voted the sum of £5750, realised by the sale of Jubilee seats, to the work in question. The ceiling and woodwork, which were quite dark and dingy, present now quite a bright and light appearance. The ceilings of the nave and aisles have been chastely decorated in buff and blue, relieved with gold, and the general tone of colouring of the rest of the church is in harmony with these tints. The woodwork, stripped of its numerous coats of varnish, looks as if it were new, and the exquisitely carved pulpit of Grinling Gibbons could not have looked fresher and sharper when it left his hand. The fine organ, built in 1690 by Father Smith, is to have the two ugly side additions removed, and replaced by carved wainscoting, more in harmony with the body of the instrument. The chancel is to be elaborately decorated, and adorned with a rich stained glass window. The altar is to be raised by two steps, to be 9in. in height each, instead of 6in., which is said to be not in harmony with ecclesiastical law, while, among some other changes, electric light is to take the place of gas.

DURING the progress of the work two singular discoveries have been made. The central oak doors, when relieved of their thick coatings of paint, and grained work and varnish, have been found to have their panels literally riddled with bullets and small shots, much of which remains in the wood. The suggestion is that at some time the church must have been attacked by an armed mob. The other discovery is of two large bricked-up doorways in the front stone wall with the hinges of the doors still remaining, whose existence was never suspected. They were found on removing some wainscoting which has for many years masked them, and were evidently early entrances to the church, which, as nearly everyone knows, was built by Sir Christopher Wren, in 1682, on the site of one that had stood there hundreds of years, more than 700, perhaps, from the present time. The discovery was made during operations to enlarge the vestry and the choir vestry by bringing the gallery stairs down into the body of the church. All the pews have been

lowered by some 15in. from the bottom, and among those that have thus suffered is Dr. Johnson's pew in the gallery near the pulpit. Unlike the lower pews on the ground floor, which are of oak, and Georgian, the pews in the gallery are as old as the church, and of deal or pine, and they have been painted and grained to match the other woodwork.

IN the course of repairing the Church of San Giovanni e Paulo, in the vicinity of the Coliseum, the discovery has been made of a most perfect and complete "balineum" or ancient Roman house bath. The "balineum" consists of two rooms floored with exquisite black and white marble squares; and in one of the chambers is a semi-circular opening beneath which is the bath of terra-cotta. The furnaces for heating the bath have been found in admirable preservation, as well as a number of small subsidiary vessels; and the whole is a magnificent example of the Roman patrician's arrangements for what was considered an indispensable convenience in those days. The fact of the "balineum" having been discovered under the Church of San Giovanni e Paulo, which dates from the fourth century, has given rise to a plausible surmise. The church itself was built on the site of the house occupied by St. John and St. Paul, who won a martyr's crown in the reign of Julian the Apostate; and it is conjectured in consequence of the existence of the "balineum," that the saints must have found a friend in the converted patrician who gave them one of his residences as a shelter. Rome as a field for the explorer should still be rich. When the project of lighting the catacombs by electricity is carried out, perhaps something very curious may be found in the remote recesses of that vast labyrinth.

"ONE OF THE PUBLIC" writes to the City Press as follows: "Will you permit me to call the attention of your readers to a private Bill, promoted by the London County Council, which, under the specious title of a 'Bill to Amend the London Building Act, 1894,' has for one of its objects the confiscation of land abutting on old streets, including those in the City, thus directly affecting the private interests of the owners of every freehold or long leasehold within the metropolitan area? The clause, stripped of its verbiage, proposes that in rebuilding on the side of any existing street the front wall of the building, or, if there is a forecourt, the boundary railing, or fence, shall be set back to a distance of 20ft. from the centre of the roadway. If such a proposal is carried in Parliament, the owner of the land will be compelled to give up (from 1ft. up to probably 15ft. in depth) valuable frontages for which he is to receive no compensation. Parliament rejected a similar proposal put forward by the defunct Metropolitan Board of Works, and again by the London County Council in 1894, and property owners, whether freeholders or leaseholders, should at once take action to prevent such a measure from being now carried. The time has lapsed for lodging petitions against the Bill; but, as it has been unexpectedly sprung upon property owners, every effort should be made to ensure its defeat. To do this, pressure should be brought to bear upon members of Parliament with a view to this dishonest measure being rejected. It may be argued that 40ft. streets are desirable, and even necessary, in the public interests; but, even so, private interests should be considered, and provision made for compensation."

THE excavations at Hiracl, Bangor, are proceeding under the superintendence of Mr. P. Shearson Gregory, the architect of the estate. The latest discoveries include a portion of an old roadway, splendidly made of seaboulders and about 9ft. broad, running north and south, a portion of a shell walk consisting of a pathway covered over with sea shells such as were common in old cemeteries; the remains of old walls, certain peculiar stones, &c. In a closer examination of the soil Professor White has come to the conclusion that the site of the finds has at one time been a sea beach.

E A DECORATION IN A PUBLIC HALL. PART OF A SERIES. BY F. W. POMEROY.

A SECOND find of great importance has to be added to the discovery of the tomb of Osiris in Egypt. M. Amélineau, to whom the first discovery was due, now affirms that in the course of his recent excavations he has acquired the positive certainty that the tomb of Set, the god of Evil, and of Horus, the personification of the Sun, is in the same necropolis of Om-El-Ga'ab at Abydos. The observations made by M. Amélineau leave no doubt with regard to this great discovery. Thus we have now the tombs of the three last god-kings of the second of the divine dynasties, which dates back 10,000 years, or one hundred centuries.

"In these days, when so much attention is given by the London County Council to the provision of sufficient exits from theatres, concert-halls, and other places of amusement," writes a correspondent, "I think that body might with advantage to the public turn their consideration to the means of exit from some of our crowded London churches. A few weeks since I visited the City Temple on a Sunday evening to hear the Rev. Dr. Parker. The huge building was packed with people in every available part, and when all the pews had been filled, campstools were produced and late comers provided with seats in the various aisles and steps leading to the doors, thus blocking every possible passage. From the seat which I occupied in the gallery I think it is no exaggeration to say quite ten minutes elapsed before one of the (so far as I could see) only two doors could be reached. Surely the danger of fire is as great in a church as in a concert-hall."

THE Lord Mayor and Sheriffs have consented to pay a State visit to the Northampton Institute, Clerkenwell, on the 18th inst. for the purpose of inspecting it and formally declaring it open. The buildings and equipment have, up to the present, cost over £80,000, and the expenditure upon the latter is not yet complete. In addition, the land, over one and a quarter acres, given by the late Marquis of Northampton, is estimated to be worth not less than £25,000. The Institute is a branch of the City Polytechnic, and is situated in one of the busiest parts of the Metropolis, immediately north of the City boundary.

It is to be hoped that the answer given by the First Commissioners of Works, in the House of Commons a few nights ago, to a question concerning the safety of the National Gallery buildings really does mean that the Government officials are alive to the risks that are daily run by the institution in Trafalgar Square. So long as the gallery is hemmed in by more or less dangerous buildings, and is actually in contact with a barrack and a row of shops, the chance of a serious catastrophe is always present. That some of this adjacent property has just been purchased by the Government, and more is to be acquired as opportunities offer, is certainly good news; but it would be more cheering to hear that steps were being taken to hurry on these measures of precaution.

A VERY important appointment will before long be vacant at South Kensington. The extension allowed to Mr. Thomas Armstrong, the present Art Director of the Museum, expires directly, and already the claims of the men who are best fitted to succeed him are being discussed. It is to be hoped (says the *Globe*) that, for once, a really appropriate choice will be made, and that an artist fully worthy to be entrusted with the control of the Art schools as well as the Art directorship of the museum will be appointed. But it is equally desirable that, if such a man can be secured by the Department, his hands should not be tied by ridiculous regulations, and that his usefulness as an administrator should not be hampered by the interference of officials not in sympathy with his views.

THE Metropolitan Asylums Board, at its recent meeting, considered a lengthy report from the Brook Hospital Committee with reference to the expenditure on the Brook Hospital. The original estimate for the hos-

pital was £194,810, and the amount of the tenders accepted by the managers in respect of its erection was £218,171 16s. 2d., whilst the amount which the managers were asked to pay in settlement of the contractor's final claims was £268,507 11s. 2d. The Committee reported that of those two amounts the architect was only responsible for the supervision of contracts amounting to £210,018 0s. 4d., in settlement of which he was prepared to certify for £259,401 15s. It would thus be seen that the difference between the total amount of the accepted tenders (£210,018 0s. 4d.) for which the architect was responsible and the total amount for which he was prepared to certify in settlement thereof was £49,383 14s. 8d., of which, however, £10,723 appeared to have been sanctioned by or reported to the Board, leaving the balance (allowing for a saving of £198 8s. 8d. on certain contracts) of £38,659 3s. 4d. to represent the value of work ordered, on the architect's individual responsibility, over and above the value of the works for which tenders were accepted by the Board. Mr. Aldwinckle, the architect, was blamed by the Committee for having under-estimated the amount of work necessary in many cases, and for having made no provision in his original estimate for many incidental matters. In connection with the foundations he had estimated about half the work that was really necessary, and that half he had estimated at about half the cost. His estimate for the foundations was £5000, and there was an extra of over £19,000, bringing up the total cost to £24,000.

THE conclusions of the Committee were that, influenced by the desire for expedition which actuated managers, officials, and architect alike, at a time when additional hospital accommodation was urgently needed and clamoured for, the architect did not give that careful attention to the preparation of the specification which a work of such magnitude demanded. They were quite prepared to admit that in the Brook Hospital the managers possessed an admirably arranged and well-built establishment, and, so far as they were able to judge, had good value for their money. All the evidence, moreover, showed that, in his final adjustment of contractors' claims, the architect appeared to have worked in the best interests of the Board. That he failed to report to the managers from time to time either the extra works which he was ordering, or the cost thereof, was, they thought, the gravest feature of the case. On the other hand, it should be borne in mind that the resolution of the managers, which forbade an architect to permit any deviation from a contract for building works, where any such deviation was expected to exceed the sum of £25, was not adopted by the Board until October 26th, 1895, at a time when the Brook Hospital was practically completed. They recommended that the contractors' claims for delay in connection with the erection of the Brook Hospital, as finally adjusted by the architect, be approved, and cheques drawn accordingly; and "That renewed application be made to the Local Government Board for an order authorising a further expenditure on loan, in respect of the erection, equipment, &c., of the Brook Hospital, of the sum of £100,000 in lieu of the sum of £75,000 applied for on October 10th, 1896." The debate on the report was adjourned, Mr. John Lobb giving notice of a resolution to ask the Local Government Board to institute a searching inquiry.

MR. GEORGE GOULD is having a gold-plated staircase and balcony built in a house now being erected for him in Lakewood, New Jersey. The design chosen is after the style of Louis XIV., and it is described as "simple, chaste, and light," garlands and torches being the chief ornaments used, while the stairs terminate not in the ordinary newel post, but in a ram's head with curving horns. The staircase will, when completed, cost many thousands of dollars.

No more gratifying testimony of the highly educative influence exerted by the Nottingham Municipal School of Art and Design could be desired than that which is apparent in the

annual exhibition of the students' works at the Castle Museum and Art Gallery. Whether regarded from an artistic or utilitarian standpoint, the collection is eminently creditable. Artistically, the productions this year are of a high standard. In breadth of conception, and conscientious treatment, they mark a distinct advance upon previous years, and foreshadow ample promise for the near future. Genuine hard work and indomitable perseverance are noticeable in every branch, and a very large proportion of the exhibits are instinct with a cultured, artistic appreciation. In Architecture, Mr. F. W. C. Gregory takes a pronounced lead. His work is admirable in the extreme, and he contributes several ornate designs, in which the minute details have been carefully preserved. He secured a bronze medal for a drawing for an institute, and close by are his designs for the new entrance gates to the School of Art, together with the working drawings. Mr. H. H. Goodall's measured drawings of the screen at Southwell Minster have already gained for him a bronze medal at South Kensington, and a design for a town club was selected for the National competition. Mr. Gregory being ineligible, the first prize goes to Mr. A. W. Bradshaw, who contributes a drawing for a public library, together with a ground plan.

IN the year 1892 it was thought advisable to make an architectural survey of All Hallows, Barking, and the late Mr. J. L. Pearson, R.A., who made the examination, discovered that a great deal of work would have to be done in order to secure the church to future generations. Since that date the repairs have gone on at intervals as funds have allowed. The accumulated earth has been removed from around the walls, and the walls themselves, with their buttresses and parapets, have been for the most part repaired. On the north side the windows have been reglazed, and the stonework renewed where necessary. A school-room has been erected, and a new oak roof placed upon the north aisle and also on the vestry. In addition, a choir vestry has been fitted up, and the chancel portion of the central roof has been restored in accordance with the first design. The total cost of these undertakings has been about £6000. Still, much remains to be done, and it is estimated that about £3000 will be required to complete the thorough restoration of the church. Parts of the building are probably more ancient than any other structure in the metropolis. No church in the City contains such beautiful wrought iron work as the handrail of the pulpit and two of the sword rests—those of Lord Mayors Bethell and Chitty—upon the screen of the choir.

At the Sheriff's Court, Red Lion Square, Holborn, a case of importance to owners of property along the lines of the new electric railways has been heard by Mr. Burchell and a special jury. It was a claim by the trustees of the late Frederick J. Blake against the Central London Railway Company for £539 for the purpose of repairing the residence No. 2, Marlborough Gate, Hyde Park, which is alleged to have suffered damage by subsidence due to the works of the railway company. It was alleged that the house in question had been structurally injured by the works of the company, either primarily or by reason of the bursting of a water main, owing to the tunnelling operations for the company's new line from the City to Shepherd's Bush. On behalf of the railway company, Sir Douglas Fox, Mr. Cooper, Mr. George Weston, and others gave evidence, and it was contended that the system of tunnelling with the Greathead shield prevented any possibility of injury to adjacent buildings, and that the subsidence must have been caused by the bursting of the water main owing to internal pressure. The jury returned a verdict for the railway company, on the ground that the damage was done by the bursting of the water main, for which the railway company had not been shown to be in any way responsible. It was agreed that the claims pending in respect of adjoining houses should be governed, as regards the question of liability, by the finding of the jury in this case.

Surveying & Sanitary SUPPLEMENT.

MARCH 16TH, 1898.

Practical Carpentry and Joinery.*

By GEO. ELLIS.

(Continued from page xvii.)

CENTRES for groined vaulting are made in two ways. If the vaulting is not of great span, a barrel or continuous centre is made for the main vault long enough to run about 2ft. on either side of the intersecting vault. The centre for the minor vault is then made with the lagging overhanging the end rib, is then brought up to and fitted to the main centre by scribing, the lagging being either nailed direct to the cross lagging, or a thin fillet bent round underneath and fixed, to carry the ends. For large vaults this method would not provide strength enough at the groins, and a different one is adopted. A rectangular frame of the width between the side walls and of convenient length is constructed, two similar frames for the transverse vault are fastened underneath this, and ribs of the requisite curvature set up at each of the four ends, and

FIG. 85. PLAN OF COMPOUND CENTRE.

FIG. 86. SECTION.

plan curve, and upon each edge of these narrow laggings are nailed vertically, a trifle longer than the rise of the arch; the bottom rib is at the springing line, the upper one half-way between it and the crown. When the side lagging is fixed, a rod set to the radius of the arch, less the thickness of the horizontal

lagging, is mounted on a temporary stretcher at the springing, and swept round the upright lagging at each side, a pencil being held at its square end, as indicated in the drawings by dotted lines. The boards are cut off to the line drawn, and the horizontal laggings nailed on their ends (see section, Fig. 86). Cement or concrete inverts formed as cradles to receive brick inverted arches are struck as shown in Fig. 89. A piece of quartering is laid across the opening

SECTION.

and propped up at a convenient height; a "trammel" fashioned like a T-square is hung from it as shown, the distance from the edge of stock of the square to the fixing-pin being equal to the radius of the extrados of the arch required. The earth is roughly shaped to the sweep and rammed. Then the concrete is filled in and the "square" swept backwards and forwards till the required outline is obtained. A similar arrangement is in use for marking the bricks for cutting, in sewers.

In Fig. 90 I give a method of finding the

centre of any arch when span and rise are given, for the purpose of striking out the ribs. Draw the springing line A B, and bisect it by the perpendicular C E. Upon this line set off the given rise, draw a line from this point to one end of the springing, bisect this line, and the intersection of the bisector with the perpendicular will give the centre of the arch required. With a segmental arch of wide springing and small rise great difficulty will be experienced in finding the centre, and when found in obtaining a rod long enough to describe the sweep. A method of accomplishing the object without the use of a radius rod is shown in Fig. 91. Set out full size on a board or floor, the span and rise in the centre, drive in three nails, one at each end of the springing line, and one at the crown. Procure three light battens, about 2in. by 3in., arrange them against the nails in the form of a triangle, as in the figure. Of the two forming the sides of the triangle, one need only reach from springing to crown, the other must be twice the length, the third is merely a brace to keep the others in position. Nail or screw them where they cross. To describe the curve, withdraw the nail at the crown, and insert a pencil in the V formed by the crossed battens; move the triangle round, keeping it firmly pressed up to the two nails at the springing, and one half the curve will be drawn. For the other half turn the apparatus over, and repeat the process.

An easy method of setting out an ellipse, when a properly constructed trammel is not at hand, is shown in Fig. 92. Draw the two axes perpendicular to each other, as A B—C D. Let A B be the span, and C D the rise required. On any thin rod set off the rise and half the span—in other words, the semi-minor and

FIG. 87. SECTIONAL ELEVATION ON A-B OF GROIN CENTRE.

FIG. 89. CENTRE FOR AN INVERT ARCH.

also two intersecting ones at the diagonals, or plans of the groins. These latter will be of elliptic curvature, the major axis being equal to the diagonal of the span, and the minor axis equal to the rise of the arch. These groin ribs will require "backing" in the same manner as a hip rafter; when the two ribs are cut to the outline, use one as a mould to mark the backing of the other. Keep both flush at the crown, and slide the lower end forward to point H in Fig. 88, and mark the backing on each side. This will produce a gradually diminishing bevel from the springing to the crown, and the boards forming the lagging will then lie flat, and can be nailed to the ribs in the ordinary way; the sharp arrises at the joints being taken off with the plane. When groin ribs project beyond the plane of the vaulting, corresponding recesses must be made in the centering.

Fig. 84 is the elevation and Fig. 85 the plan of a compound centre, i.e., one curved in both directions, in this case for a semi-circular arch in a segmental wall. Two ribs are cut to the

* All rights reserved by the Author.

semi-major axes—measuring both from the same end of the rod. Arrange the rod in position across the lines, so that the points will coincide with the axes, and mark at the end of the rod. Repeat the process, as shown by the dotted lines in the figure, until a sufficient number of points in the curve have been obtained, when the outline may be drawn through them by freehand, or a series of nails driven in at the points, and a thin strip of

SANITARY SURVEY OF ENGLAND AND WALES.

A SUPPLEMENT in continuation of the report of the Medical Officer of the Local Government Board for 1894-95 embodies a summary of the general sanitary survey of urban districts in England and Wales made

satisfactory results to which it conduced, rests largely with Dr. Barry, whose very able services the Medical Department could ill spare. Dr. Barry, in the introduction which his death left unfinished, states that the survey had to do, in the first place, with the

SAFEGUARDING OF THE COAST-LINE,

and embraced the inspection of 60 port and 74 riparian districts. In the selection of the

FIG. 91. METHOD OF DRAWING THE CURVE WITHOUT THE CENTRE.

wood bent around them to guide the pencil in marking. The joint lines of the ribs and the direction for the braces in centres of this form may be found by describing a line normal to the curve at the particular point required. First the foci of the ellipse must be found. To do this, set either compasses or rod to a radius equal to half the span, or semi-major axis, and from point C at the crown as a centre describe an arc, cutting the major axis in two points (F—see Fig. 92). These are the focal points. Join these two points to the point in the curve where the joint is desired, and bisect the angle so formed, as at N. This line is the normal, and will give the direction of the joint.

(To be continued.)

MR. JAMES SAUNDERS, assistant surveyor under the Oldham Corporation, has been appointed city surveyor and water engineer at Chichester.

THE Moffat Burgh Commissioners, having considered three systems of sewage purification as reported on by Mr. T. O. Niven, C.E., Glasgow, resolved to adopt the system known as Mr. Dibdin's, or the Sutton system, by which the sewage receives biological treatment, being purified by bacteria before being discharged into the river. At Moffat, owing to the substratum of land being porous, the tanks will require to be built of brick instead of being cut out of clay where this is available. It is proposed to provide an installation capable of dealing with 200,000 gallons in twenty-four hours, which will necessitate an area of about 670 square yards for tank and filter accommodation. The total estimated cost of introducing this system of sewage purification is £2350.

THE South-Eastern Railway Company has completed the reconstruction of Port Victoria pier, the terminus of the Hundred of Hoo branch, which was temporarily closed for traffic in October, 1896, on account of the structure being considered unsafe to bear the strain of trains. The pier has been strengthened by the addition of 324 new piles, the largest of them being 70ft. long and 17in. square. The piles on the river side of the pier have been left standing 6ft. above the deck level, in order to prevent the sponsons of Royal yachts from settling on the edge of the pier when lying alongside at high water. The whole of the old piles have been left in, the new piles being driven alongside of them and being bolted to them by 1½in. bolts. To prevent the inroads of the "teredos," popularly known as shipworms, which have eaten away the old piles in such a remarkable manner, the new piles have been sheathed with copper for a height of 4ft. above mud level. The plan of the superstructure—platforms and buildings—has been entirely altered, the rails being now laid on the inner side of the pier, facing the Isle of Grain. A covered way has been provided for the convenience of royalty arriving or disembarking, and the length of the platform has been extended to 500ft. The works have been carried out by Messrs. John Aird and Sons, of Lambeth.

during the years 1893-95, when cholera on the Continent of Europe was an ever-recurring source of danger to this country. Sir Richard Thorne, in submitting the summary to the President, states that the issue of the volume was unavoidably delayed by a serious accident which befel Dr. F. W. Barry, to whom the survey had been entrusted. Owing to this delay, and to the subsequent death of Dr. Barry, which occasioned a serious loss to the department, the summary relates almost exclusively to the work done by the medical inspectors of the Board in urban sanitary districts. Sir Richard Thorne says the report indicates "the directions in which English

SANITARY ADMINISTRATION

proceeds when danger of imported infection arises; and it serves to emphasise the point that our main trust in the control of exotic disease lies, not in futile attempts to keep away from our shores all chances of infection, but in urging those who are responsible for the health of our communities, whether urban or rural, to maintain, by continuous and systematic work, such a standard of cleanliness as regards air, soil, and water that their districts shall not afford to any chance infection that may reach them the opportunities for multiplication and diffusion." He adds that never before has so sustained and so important a piece of administrative work been undertaken by the Medical Department as that which was carried out during the period 1893-95, when cholera prevailed in different parts of Europe. The credit for the organisation of that work, and, to an important extent, for the

districts to be inspected, the question of the purity of the water supply largely influenced the Board, districts being chosen primarily in which that supply was suspected of being liable to pollution. Subsequently a number of districts were scheduled for inspection in which the administration was believed to be defective, or in which former experience had shown that filth diseases had prevailed. The matters to be inquired into comprised broadly (a) general sanitary circumstances, (b) sanitary administration, and (c) cholera precautions. During the survey, 220 urban districts (comprising 14 county boroughs, 66 municipal boroughs, and 140 urban districts other than boroughs) were inspected, and abstracts of the 220 urban reports are presented in the volume just issued. The last sentence written by Dr. Barry was the following:—"As to the value of the sanitary survey there can, I think, be no two opinions, and it is only to be regretted that owing to the exigencies of the public service it could not be continued for a longer period." The abstracts of detailed reports submitted show that in the case of every urban district inspected some

SANITARY IMPROVEMENT

or other is desirable, especially in regard to water supply—a large number of the gathering grounds being dangerously polluted—while in many instances the inspection disclosed a condition of affairs which called for considerable modification in other respects. In every district the medical officer representing the Local Government Board, after concluding his inquiries, sought a conference with the local

FIG. 88. PLAN OF A "CLOSE" GRAIN CENTRE.

Surveying and Sanitary Notes.

THE Moorend Outfall Works are nearing completion, and will shortly be used in connection with the drainage of the parish of Mangotsfield. Mr. W. L. Le Maitre is the engineer. The total cost of the scheme will be about £6000, and the site where they have been built is a twelve acre field at Moorend, not far from Winterbourne Down. Nine-inch conveying pipe sewers are used, and these, after joining 12in. and 15in. subsidiary mains, are eventually collected by an 18in. main direct to the works. The precipitation tanks into which the sewage is horizontally conveyed are each 24ft. in diameter, and have a holding capacity of 44,000 gallons. After undergoing various processes, the top water or "tank effluent" passes into clarifiers, and thence through channels to the filters. These are constructed of cement, concrete, and brickwork

of a substantial nature. The filtering material is 2½ft. in thickness, containing a base of pebbles, in which 3in. lead pipes are laid. The remaining successive layers are composed of gravel sand and a patent filtering material known as "polarite." Each filter is so constructed that a flow of water will pass under continuously, and to prevent consolidation of sand they are arranged so that it will be possible to upwash any specific filter from its accessory by a head of water. The engine-house is substantially built of red brick relieved by Bath stone and suitable cornices and the central stone is lettered with the names of the Parochial Committee and its officers, under whose régime the work was brought to a completion. It has three chambers. In the first are a seven-horse power engine, air compressor and receiver water vessel, and centrifugal pump for raising the effluent into the storage tank. The second chamber, or press room, contains the lime-mixing apparatus, sludge rams, presses, and a centrifugal pump to raise the top water from the sludge. The third chamber is used for storage purposes.

FIG 90. METHOD OF FINDING CENTRE OF SEGMENTAL ARCH.

sanitary authority, in order to make such recommendations as appeared to him to be necessary. These recommendations affected (1) water supply, (2) provision for the isolation of infectious disease, (3) sewerage and house drainage, (4) disposal of refuse, (5) repression of nuisances, (6) inspection of dairies, cowsheds, and milkshops, (7) overcrowding in dwelling-houses, (8) insanitary dwellings, (9) disinfecting apparatus, and (10) special precautions against cholera.

IN the Court of Session, Edinburgh, the Second Division disposed of an appeal in an action brought by Donald Sutherland, solicitor, Nairn, against Robert Squair, mason, Nairn, and other tradesmen, contractors for the erection of a villa at Thurlow Road, Nairn, which was being built for the pursuer. It was stated that the contractors, after proceeding so far, had ceased to perform the work, and had left the job in an unfinished state. In these circumstances, the pursuer craved the Court to remit to a person of skill to inspect and report upon the work done, to ascertain the value thereof, and thereafter to authorise the pursuer to complete the work at his own hand at the expense of such contractors as might be found to be at fault. Sheriff-Substitute Rampini allowed a proof, and, on appeal, Sheriff Ivory recalled this interlocutor, and dismissed the action as irrelevant, with expenses. On appeal, the Second Division adhered to Sheriff Ivory's interlocutor, with additional expenses.

Scottish Church Architecture

OF THE

XIV. AND XV. CENTURIES.*

By HIPPOLYTE J. BLANC.

TO attempt anything like a detailed or systematic examination of the church Architecture of Scotland, of the fourteenth and fifteenth centuries, is not here intended. The variety of detail those periods exhibit makes their study very interesting. I hope to satisfy you with a sketch of some of the most prominent examples, which may form leaders to much of like form and detail to be found in many smaller works, and to endeavour, as far as possible, to assist you in your knowledge of the English work of the same time, to compare, from the illustrations, the contemporaneous Architecture in Scotland. One cannot pretend to be very accurate with regard to the precise dates of each and all of the examples selected, because of the special difficulty all students of Scottish work have experienced in chronologically placing them. This may be better realised as we proceed. To many who may have extended their studies of

CHURCH ARCHITECTURE BEYOND THE CONFINES OF ENGLAND

into Scotland, it will doubtless be at once apparent why this particular period of our church examples should be selected; but to those who have not had that opportunity some preliminary words of explanation may be acceptable. In a word, it is the Scotch work of the fourteenth and fifteenth centuries (and for that a large part of the sixteenth century also), which will be found to be more distinctly Scottish than can be said of the works of the centuries preceding. The most casual observer of church forms and details of the eleventh and twelfth centuries in France and in England will readily trace their genesis in the one country, and their acceptance and adoption in the other. During the early part of the Middle ages, when, under the freshness of enthusiasm, Christian emigrants rapidly spread themselves all over Europe, Scotland also received the foreign influence, and readily accepted the progressive developments of architectural forms and details which the church building fraternities brought with them. I do not suppose that anyone has contended that Scotland, during that early period, expressed a style of her own, or even expressed then any very distinctive individuality in her treatment of churches; rather she adopted, under the guidance of her church patrons and founders, the

CHARACTERISTICS FROM BOTH FRANCE AND ENGLAND.

So we find that during the Romanesque, Norman, and First Pointed periods of church building, there is an evident parallelism in the works of France, England, and Scotland, on to the thirteenth century. In England, church builders accepted the leading from France, while there are evidences that she showed some individuality in treatment of details. In Scotland, the French influence for long was strongest. In England, the general proportions differed from those in France; English cathedrals of the twelfth and thirteenth centuries are wider, but not so lofty as are those of the same era in France. In this matter Scotland seems to have followed more closely the French models. English work shows more restful consistency and solidity, but seems to lack the rich grace and elevating continuity of forms—the emotion—of French examples. Whether Scotland, in her works of that early time, ever reached the great flights of skill and poetic expression witnessed in the French examples, we have perhaps lost the means of determining. Wherever, however, remains of her early works are found, there is enough to show that, while her buildings could not vie with those in England in respect of magnitude or richness, yet as regards elegance of composition and expression of disciplined refinement of detail, the abbays and cathedrals of Scotland can claim equal merit; they pos-

sess the same grace; they show the same skill in execution. Her church designers have exhibited equal ability, and her artificers show themselves to have been equally capable with those of other countries during all periods up to the end of the thirteenth century. In Scotland, the buildings were fewer and of smaller dimensions. Chronologically they are several years later than are the English examples, but in plan, general treatment, and in the order of development they do not differ much from their prototypes. As illustrative of the differences of dimensions of contemporaneous cathedrals in England and Scotland the following may serve:—

York	524ft. in length	St. Andrews.....	358ft.
Lincoln	482ft.Glasgow	283ft.
Salisbury.....	474ft.Elgin	282ft.
Durham.....	461ft.Kirkwall	218ft.

Scotland's equal pace with England in the progress and expression of her church Architecture is readily understood when we know that at this time the Norman barons, encouraged by David I., and tempted by extensive gifts of lands, spread and established themselves and their families all over the better parts of Scotland, and following that great example of "that sair sanct for the Crown," founded bishoprics, and for centuries became patrons and superiors of bishops, and also liberal founders of abbays. Those noble Norman lords and knights carried with them from time to time, along with a love of war and the chase, a strong desire to foster the arts of peace, more especially in the form of church building. We find them liberally encouraging the Church in turn by gifts of lands, in which such abbays as Paisley and Melrose shared very largely. Parish churches also, as were required, were built by those barons, and were afterwards, by consent of the bishops, conferred in property upon the great monasteries and religious Houses of Regulars.

THE SINGULAR UNIFORMITY

characterising the ecclesiastical buildings of the twelfth and thirteenth centuries would seem to indicate that fraternities of church builders assisted in rearing the beautiful edifices found over Europe. Rickman reminds us that when Early Gothic was developed, the whole western provinces of France were under the dominion of the English Crown, and that Normandy had been for a century or more part of the same kingdom. Thus Norman knights and churchmen would find ready access to England and Scotland, and carry with them the progressive development of church style. In many cases we know that monastic buildings in Scotland were subject to the rule of the French monasteries from which the communities branched, but, as if anticipating Pope, who enjoins—

Who builds a church to God and not to fame,
Should never mark the marble with his name;

the architects of those great cathedrals have not left any record of their names. If, as we assume, those buildings were the outcome of an aggregation of thought by fraternities, the explanation is apparent. There is no doubt that

CHURCHMEN STUDIED ARCHITECTURE,

and were for the most part architects of their own buildings, being aided and counselled in matters of taste by the members of church-building fraternities already referred to. The influence of England at this time upon our Scottish Church Architecture must have been likewise very important, because we know that the clergy who served in the Scottish churches were either priests from England or kinsmen of the Anglo-Norman founders born in Scotland. "Of the fifteen prelates who were elected to the primatial See of St. Andrew's during the twelfth and thirteenth centuries, and who designated themselves 'episcopi Scotorum,' not one appears to have been a Celtic Scot. Only a few sprang from the Anglo-Norman houses of Scotland, the great majority being Saxons and Normans from England." There must have been much interchange besides, because we are informed that monks from Melrose became abbots of the Yorkshire monastery of Rievaulx, the parent house; Melrose also sent abbots to other

Cistercian houses, including Kinross, Cupar, Newbattle, Deer, and Balmarnock. Those warlike nobles, patrons of the Church, always in a state of preparedness for war, became the general protectors of the unarmed monks, who thus enjoyed unmolested security in pursuing their building operations. The influence upon the country by

THE BUILDING OF AN ABBEY

was great. A long period was usually required for the work, and during that time its members were continually in the midst of the practice of all the arts—painting, sculpture, Architecture, as well as the ornamental hand works, for these were all practised together. The highest taste was thus cultivated, to be afterwards disseminated for the greatest good of the country. To these influences may be added zeal for religion, a higher ideal, a generous rivalry between convents, and a desire to render the church ritual magnificent—each and all of which gave impetus to church work in Scotland, and kept it full of vitality and abreast of the best work found elsewhere. The industrial and social life of Scotland up to the thirteenth century were likewise in a very flourishing condition. In 1249, when the Earl of St. Pol and Blois (a great French lord) was preparing to accompany St. Louis (IX.) of France in his memorable expedition to the Holy Land, builders from Flanders, Marseilles, and Genoa were employed for the armament, and Scotland supplied from Inverness one of the great ships, which gained much admiration. The burgher and trading classes also amassed great wealth, and gave generously of their lands and means to the Church. Scotland was thus a centre of intellectual culture, and enjoyed at this period more peace than fell to the lot of English monarchs. But all at once all these favourable conditions changed. By the sudden death of one of her most enlightened kings, Alexander the Third, in 1286, Scotland's lamp of prosperity and progress was unhappily extinguished, only to be rekindled after a long interval. The succession—an effort to arrange which had been counselled during the lifetime of the king—was now brought to open dispute. England essayed to adjust the matter by placing a king under vassalage to her. This was resented, and wars followed between England and Scotland, and it was only towards the close of the fourteenth century that Scotland began to show signs of returning restfulness and prosperity.

THE EFFECT UPON SCOTLAND'S ARCHITECTURE was disastrous. Scarcely any new buildings were undertaken, and under the wars many of the finest of those existing were greatly damaged. Her patrons—the wealthy nobles—had left the country, many to espouse the cause of England's kings, to whom, after the death of Alexander, they had sworn fealty. During that interval of strife—upwards of eighty years—England's church Architecture had developed new features, passing out of the First Pointed to a new phase—the Decorated or Middle Pointed. But when Scotland resumed her church building her schools of church builders had passed away; consequently she had to go back and, so to speak, recommence the thread of architectural evolution from where she had left it in the thirteenth century. Even the monks had been cast adrift, to find elsewhere the help their homes could no longer afford. In the beginning (that is, in the fourteenth century) few churches were built, but gradually, as returning prosperity increased, Scotland became alive to what she had lost in Art, and in the fifteenth century she came forward with renewed vigour in the expression of a series of churches distinctly of native growth and development.

THE PERFECTED FIRST POINTED PERIOD, with its refinement and purity, its gracefully clustered shafts, lofty groined roofs, and elegant carvings was, in England, virtually obsolete. A style more massive had taken its place, the distinctive features of which were a greater exuberance of ornamentation, wider fenestration with elaborate cusped tracery, pinnacled buttresses, profusion of niches on walls and buttresses, &c. All these were matured and were even passing out of English practice when Scotland commenced again her

* A paper read before the Architectural Association on Friday night.

church work. England had actually entered upon her phase of the Perpendicular. France, with the buoyancy and vivacity of the race, rose out of her Decorated work into the flow of a restless form designated Flamboyant. Thus Scotland, along with the examples of First Pointed in her midst, had the association of the Decorated and Perpendicular of England and

THE FLAMBOYANT OF FRANCE

on which to draw for inspiration. The result we find is not an adoption of either, but a sort of adaptation of all, in which the work of the Decorated period predominates. Thus Scottish artists struggled bravely to regain for her a parallel place with other countries, and, though here and there comparatively unsuccessful, much of her later work of the fifteenth century and of that entering upon the sixteenth century exhibits a return of the native talent for graceful expression and skilful execution. Of the contemporaneous works of England and France no doubt Scotland assimilated a good deal; but in all cases it would appear that she gave an independent character to the rechauffé. Thus her Perpendicular work, which is chiefly found at Melrose Abbey, with a scattered fragment here and there over the country, can scarcely be said to be merely a repetition of that in England. Moreover, with regard to the French influence of the Flamboyant of the same period, it will be found that Scottish examples really show very little of the actual forms of that style. The forms of window tracery, for instance, might be described as a transition between Decorated and Flamboyant. The construction is heavier, but the forms are far more restrained than in the French examples, and are by no means inelegant.

OF DECORATED BUILDINGS

there are few entire examples in Scotland. They were not executed while that style was in practice in England. The Decorated style, however, lingered very late in Scotland, examples being found up to about 1462. The later examples are not so successfully treated, however, the best work being found in Lincluden, Crossraguel, the nave of Glasgow, Elgin Chapter-house, Linlithgow, and part of Melrose. After the date named the work in Scotland became very mixed and degenerate, and under later influences began to show a larger infusion of the contemporaneous work of her Southern neighbours. During the centuries under review no cathedrals nor conventual churches were founded, yet many alterations and additions were made upon those existing. To Glasgow Cathedral was added the upper part of the nave in the beginning of the fourteenth century, while the sacristy, the tower, and the south crypt were added in 1425 and 1500 respectively. In these is manifested the lingering attachment of the Scotch to earlier forms, all beautifully blended in a most interesting manner with details of a later period. But decaying piety and the comparatively diminished resources of the country brought about a reduction in the dimensions of her works. Hence we find, as fewer clergy were required, Scotland's chief works are

THE COLLEGIATE CHURCHES AND CHAPELS,

of which nearly forty were founded in the fourteenth, fifteenth, and sixteenth centuries. David Laing says there were thirty-six erected all over the country in the fifteenth and first half of the sixteenth century. They present in their detail nearly all that is characteristic of the period. Many of them no longer exist. They were built and endowed for a society of priests, commonly in a place not within the Episcopal see. The society consisted of a dean or provost, or other president, and, under them, prebends or canons who had in the Church several degrees or stalls, where they sat for the more orderly singing of the canonical hours. They were instituted for performing Divine service, for singing Mass, vespers, &c., to the memory of the founders. They were divided into two kinds; one of royal foundation, whereof the king is patron, confers the prebends, names the provost or dean, and the canons or prebendaries; the other the foundation of barons. Both, in their

services, were regulated as in cathedrals, but were not under cathedral control.

GENERALLY THE PLAN IS CRUCIFORM,

or intended to be so (because a great many have never been completed), and comprises a central, or sometimes a western tower, a sacristy on the north side of the chancel and a porch on the south side of the nave. In one or two instances are chantry chapels, sometimes the addition of pious founders. In St. Giles' Cathedral, Edinburgh, we have many such additions. Aisles are not common except in the largest of them. Roofs are plain, arched with ribs, but rarely groined. In one case, Roslin, the stone arch has no other external covering. In roof treatment there are many very interesting and quite unique features. Over the vaulting is laid a series of overlapping and guttered blocks of stone in parallel squares, in some instances at very high pitch and others very nearly level. This form of construction involved much difficulty in cases where transept or chapel roofs rose up upon the nave roof. In such cases each section of the building was treated independently with gabled termination. This feature is met with all over Scotland, and seems especially a Scottish invention, being perhaps originally designed for her castles of much earlier date. It is not much met with in English work, and, indeed, I cannot name an example. The forms of most of the buildings of this period being

CHIEFLY AISLELESS STRUCTURES,

gave special prominence to the windows. These were large, and arch-headed, of two, three, and four lights. They were not lofty, however, evidently to avoid cutting in upon the interior vaulting, and necessitating cross vaulting with its more intricate construction. In England, even, we find that notwithstanding the greater richness their works express, the groined vaulting has given place to plain surface vaulting, but decorated with a superfluity of ribs which are merely ornamental. In the same way, while we have a few examples of good vaulting, such as in the south crypt of Glasgow Cathedral (noted to be of 1425, but the precise date is not obtainable), in Trinity College Church, Edinburgh (a building now demolished), and in the collegiate churches at this period—ornamental ribs are here and there found applied to surface vaulting, merely to give distinction to a part of the interior of the building, very often the elongated chancel or choir—such as the chancel at Seton Church. Other examples of this are at Melrose, and St. Mirren's aisle or chapel, Paisley.

IN LINLITHGOW AND STIRLING CHURCHES

may be seen some interesting manifestations of ingenuity in overcoming the difficulties of vaulting over the apsidal terminations of the choir. Fan vaulting is not found in Scotland. Roslin Chapel already referred to (the plan of which resembles very closely the character of the choir of Glasgow Cathedral in its aisles and retro-choir) bears the simple pointed arch vault. It is, however, profusely decorated with ribs rising from the main piers, and, on the fields between, with an exuberance of carving quite unique. The side aisles are vaulted at right angles to the choir vaulting, and in this way a greater elevation than would otherwise have been available is obtained for the windows. This chapel was founded in 1446, and while bearing in its charter that it was built by workmen from foreign parts, it possesses all the evidences of being of home manufacture. The details in moulding are those found on other collegiate churches of the period. Its buttress-framed quasi-porches are quite unique and thoroughly Scottish. For richness and interest in carved work it stands unequalled, if its small dimensions are considered, and in view of the fact that about this time (that is, 1446) French masons were numerous in Scotland, it is possible some were employed upon Roslin. This would explain the charter notice referred to. A pointed arch springing from each bay of the aisles is spanned by a richly carved flat arch between the nave, pier, and wall.

(To be continued.)

ARCHITECTS' BENEVOLENT SOCIETY.

THE annual meeting of the above Society was held at the rooms of the R.I.B.A., 9, Conduit Street, on Wednesday of last week, Mr. G. Seamell presiding. The report of the Council, read by the Hon. Secretary (Mr. Percivall Currey), stated that the progress in the Society's affairs had been maintained in the past year, and that in view of the many calls upon the means of private individuals during that period, the Council did not think it advisable to make any special appeal on behalf of the Society to the architectural Profession. Nevertheless, it had the satisfaction to report that many liberal donations had been received, and that several new subscribers had been added to the list. The report proceeded:—"Although the Society now possesses 300 annual subscribers, the Council feel that this number is not sufficiently representative of the large body of architects practising in the United Kingdom; they are assured that there must be a large number of architects, not subscribers to the Society, who would be desirous of helping their less fortunate brethren, or their widows and children who have been left insufficiently provided for.

THE USEFULNESS OF THE SOCIETY

would be increased in proportion to the augmentation of its list of subscribers; and the Council would remind those who have not contributed to the funds of the Society that an annual subscription of one guinea has the privilege of recommending two applicants for grants during the year, and that relief is always afforded to worthy and properly accredited applicants when there are funds available for the purpose. It is earnestly wished that the list of annual subscribers should be increased, and members of the Society might materially help in effecting this object by bringing its aims and work under the notice of their brother architects." The report further stated that the amount received in annual subscriptions was £456 10s., as against £453 8s. in 1896. Four members had withdrawn and twelve were in arrears when the books closed for the year. "A larger number of applications for assistance than usual were made to the Society, and considered by the Council. After proper investigation in each case the sum of £607 1s., as against £569 10s. in 1896, was distributed amongst forty-three applicants; and £70 was paid to the Society's three pensioners. As the exertions of successive Councils, for many years have succeeded in bringing the amount of the invested capital up to £10,000, your present Council consider that the Society might now

INCREASE ITS PRESENT LIST OF THREE PENSIONS

of not less than £15 a year each to six pensions of not less than £20 a year each. The approval of this step would, the Council think, add to the happiness of deserving applicants by the knowledge that they were to receive annually a certain sum."—The Chairman, proposing the adoption of the report, said he believed there were two thousand members in the Institute alone, and yet they had only three hundred subscribers to the Architects' Benevolent Society. He hoped members would use their influence in obtaining new subscribers.—The report and financial statement (which showed a balance in hand on the past year of £34 7s. 4d.) were passed.—A vote of thanks was accorded to the outgoing members of the Council, and that body was elected as follows: President, Prof. Aitchison, R.A.; Messrs. Arthur Crow, E. A. Gruning, G. T. Hine, Arthur Cates, Aston Webb, H. L. Florence, J. T. Christopher, Sydney Smirke, W. Grellier, E. W. Mountford, R. St. A. Roumieu, Wm. Woodward, E. B. P'Anson, and E. H. Martineau. The Hon. Treasurer (Mr. W. Hilton Nash) and Hon. Secretary were re-elected, with votes of thanks for their past services, and Messrs. Foster Haywood and G. Lethbridge were appointed auditors. In accordance with the suggestion of the Council, in the report, it was agreed to alter Bye-law

65, by substituting the words "six pensions of not less than £20 each," for "three pensions of not less than £15 each." The opinion was expressed that the Council should pay the same by quarterly or half-yearly instalments. A proposition to alter Bye-law 6, so as to read:

"A DONOR OF TEN GUINEAS,

or a donor of five guineas, being also an annual subscriber of one guinea or more, or an annual subscriber of two guineas or more, is eligible to become a member of the Council," provoked some discussion as to whether it was advisable to add the words in italics. It was urged that the Society would be likely to benefit by the proposal, which was eventually carried, it being explained that another meeting would have to be held to confirm the alterations, and that then the matter could be re-considered if thought desirable. Votes of thanks were accorded to the outgoing auditors, the R.I.B.A. for the use of rooms, and the Chairman; and a vote of condolence with the family of the late Mr. J. Edmeston was also passed.

Views and Reviews.

BUILDING IN ST. LUCIA.

Those interested in building in foreign climes generally, and in the West Indies in particular, would do well to purchase "Building in St. Lucia," by John T. Rea, and issued by the Association of Surveyors of H.M. Service in its occasional papers series. The author's purpose is to give a description of "the methods of work and peculiarities of building construction and engineering observable in St. Lucia in particular, and in the West Indies generally." He first gives an account of the geographical, geological, and physiographical conditions of the country, and, whilst speaking under the last-mentioned heading, makes some interesting observations on the subject of the effect of earthquakes on buildings. "Structures of wood," he says, "undoubtedly resist earthquakes better than those of brick or stone; but, of course, there is the danger from fire, and the former material would not do for the more important edifices. The old stone buildings in Castries give many indications of having suffered, being in some cases out of plumb and even cracked, and have here and there been strengthened by iron tie rods. . . . Masonry should be built in *l'as lime*, which has the valuable property of re-setting in any slight damp, so that when a building is fissured by earthquakes and cracks, will speedily close again and still be of a yielding nature. Caverns, wells, and quarries retard the disturbance of the earth and protect works in their neighbourhood." Speaking of climatic influences, Mr. Rea says: "The poisonous effects of the vapour arising from the decaying animal and vegetable matter with which the soil in hot countries is particularly impregnated are now well understood, and, profiting by the experience of the past, all modern barracks in the tropics are constructed so that the ground floor is raised several feet above the level of the soil, and the whole area of the site underneath covered with a layer of concrete, having a deep air space between. The walls surrounding this space are pierced with numerous large openings, so that the wind can sweep in every direction below the building." The author proceeds to give instructive details on the planning and construction of buildings, which includes a full description of military works. A tabulated statement shows the quality of the building materials obtainable in the island, and a few plates illustrate the kind of erections carried out. The pamphlet, which contains about eighty pages, is published at half-a-crown, by Robert Carruthers and Sons, Inverness.

The foundation stone of a new parish church at Handforth, near Wilmslow, has been laid. The new building is being erected in brick and stone on land adjoining the present church, at a cost of £3000.

Professional Items.

ACCRINGTON.—A new cottage hospital has been erected in Whalley Road, Accrington. The original estimate was about £3000; but after the committee had visited similar institutions elsewhere they found that it would not be possible to erect a hospital adequate for the needs of the town and district for that amount. The scheme was, therefore, enlarged. The bills of the contractors and others amounted to £5240. The hospital is built of red plastic brick, with Yorkshire stone dressings or terracotta, and is designed in the Renaissance style. The wards will accommodate sixteen beds.

BETHAM.—The church has been beautified by a stained glass window, which has been placed on the south side. It has three lights, each containing a standing figure of an apostle. The figure of St. Peter in the centre light stands at a higher level than the others, and in an architectural base is a small delicately painted subject of our Lord's preaching in the temple. The window has been designed and executed by Messrs. Shrigley and Hunt, Lancaster.

BRIERLEY HILL.—A new Primitive Methodist chapel has been erected in Moor Street. The front of the edifice is Renaissance in style, and the terra-cotta ornamentation is effective. A large central window is one of the principal features of the façade, and there are vestibules on each side giving ingress to the interior, which has an air of comfort and good arrangement. The church has an open roof, the principals being filled in with carved and pierced work and shaped spandrels. The pewing and framing is of pitch pine, and polished walnut is used for the rostrum. The chapel is heated by hot water. A raised gallery is provided for the choir, and there are vestries and other accommodation. Messrs. Hicklon and Farmer, of Walsall, are the architects, and the work has been carried out by Mr. Horton, contractor, of Brierley Hill, at a cost of £1500.

DRIFHLINGTON.—A new Sunday school has been built at Drifhlington. It has been erected from plans prepared by Mr. Banstock, architect, Batley. It will provide accommodation in the shape of eight class rooms, a large assembly room for school purposes or for public assemblies, a chapel-keeper's house, and a school kitchen. The cost has been about £1600.

HALIFAX.—The new premises of the Halifax and Huddersfield Banking Company, in Commercial Street, Halifax, form one of the most notable buildings in the town. It has been erected from the designs and plans of Mr. W. Clement Williams. The style adopted for the elevation is Classic of the ornamental type, and is Corinthian in detail. The main entrance is approached by a vestibule treated in an ornamental way in Doulton ware, and of the same elaborate character as the rest of the Architecture. On the right and left are minor vestibules, from which direct entrance is obtained into the banking-hall, which is a large and lofty apartment, lighted from the roof, the lower portions of which are toned in coloured glass. Corinthian columns with dados are ranged all round the hall, supporting cantilevers with statuary. The front portion of the floor is of a tasteful mosaic pattern, and the counters and desk are of fumed oak. On the left hand is an archway, leading to the manager's private room, besides which there are three waiting-rooms. Close by are the directors' room and sub-manager's offices, the latter apartment being so arranged as to overlook the whole of the banking-hall. On the opposite side of the hall are the accountant's departments and the strong-rooms for bullion, plate, and books, respectively. The upper floor contains apartments for the storage of books, the keeper's residence, the bank manager's private room, and the directors' dining-room.

LANCASTER.—The principal feature in the proposed enlargement of Castle Station is the new island platform, which will take the place of the present "up" platform. The length of this new platform will be about 756ft., and the width of the central portion will be about 60ft. There will be every convenience provided in the way of refreshment-rooms, waiting-rooms, &c., upon this platform. The present "down" platform will be extended by about 200ft., and there will be four lines of rails between this and the island platform. The local traffic from the Castle branch of the Midland Railway will be dealt with by an additional platform on the east side of the station, and the local traffic from the Glasson Dock branch will be dealt with by an additional platform on the west side. The new platforms will be approached from the town by a new road on the high level on the east side. A large booking-office will be erected, and access will be gained to the platforms by a covered footbridge, which will be provided with stairs for passengers, and there will be a separate footbridge with hydraulic lifts for luggage. A large portion of the platforms will be roofed in.

LIVERPOOL.—A couple of years ago the beauty of Sefton Park was enhanced by the erection, by Mr. Yates Thompson, of a palatial palmhouse costing over £12,000. Recently Mr. Yates Thompson, who was accompanied by the Lord Mayor and Mr. Mackenzie, architect, of the firm of Messrs. Mackenzie and Moncur, horticultural builders, Edinburgh, attended at the meeting of the Parks and Gardens Committee, and offered to erect a splendid conservatory in Stanley Park. Plans of the proposed building, to cost £10,000, were laid before the members of the committee, who expressed their appreciation of Mr. Yates Thompson's generosity by according him a hearty vote of thanks. The new palmhouse will be about 120ft. in length, but of somewhat different style to the one in Sefton Park, and will be erected opposite the bandstand in Stanley Park.

Mr. Shelmardine (the City Surveyor) recently presented a report to the Liverpool Corporation Finance Committee as to the utilising of the site of St. George's Church. He said that he had personally inspected the church and the vaults underneath. The plans submitted, which appeared to have been made in the year 1815, showed that there were 116 vaults or grave pits, situated directly underneath the body of the church. These contained the remains of 813 persons, the last interment having taken place about thirty years ago. The majority of the pits had wooden lid coverings, which in many instances had fallen in, and inasmuch as no earth covered them, the coffins, and in several cases the remains, were disclosed. With regard to the church, the Act stated that "the trustees shall within two years take down and remove the church, and, with the consent of the Lord Bishop, sell or otherwise dispose of the materials thereof." The trustees' surveyor (Mr. Bradbury), who had had an interview with the Corporation surveyor on the subject of the removal of the church, had stated that it was the intention of the trustees to take down and dispose of everything to the floor level of the church, leaving the spire and arches of the vaults and the foundation for the Corporation to remove. The trustees claimed that under the Act they were entitled to take down and remove only such portions of the building as they might think fit. The effect of that would be, if the trustees carried out the demolition in the manner intimated, that the Corporation would be put to considerable expense, far exceeding any sum that would be realised by the sale of the old materials. To take down the spire, which was a lofty one, scaffolding would have to be erected, and that would be a costly undertaking itself, while the removal of the foundations and the external walls, which were 3ft. 6in. in thickness, would be another item of expense far outweighing the value of the material. The surveyor, therefore, asked for instructions from the committee with regard to the matter. After the removal of

the church, clause 15 of the Act provided that the Corporation should be at liberty to use or build on the site, or any part thereof, for any city or street improvement, or other public purposes, but not for any commercial purposes. Consideration of the report was postponed until more information was obtained.

LOWMOOR, NEAR BRADFORD.—Three stained-glass windows have just been placed in St. Mark's Church, Lowmoor. The subjects represented are "The Holy Family," "Ruth," and "Dorcas." The work is from the studio of Messrs. Abbott and Co., Brock Street, Lancaster.

MOSELEY.—Moseley Parish Church has been re-opened, after undergoing considerable enlargements. The alterations have been designed by Mr. J. A. Chatwin. The church was formerly one of those box-like structures, with bare walls and a flat east end, without any recess for the Communion table. A few years ago a north aisle was erected, which somewhat relieved the monotonous effect of the interior. At the same time a small apsidal chancel was also erected, in keeping with the old building of sixty years ago. This was found to be a mistake, and it was to rectify it that the bold plan suggested by the architect was adopted, which provides a large chancel, a chancel aisle, and also a south transept, which will accommodate about one hundred additional sittings. The plan was made with the view of extending the improvements hereafter by dividing the present body of the church into a well-proportioned nave and south aisle, which, with large clerestory windows, will make the building one of the finest of local parish churches. The east window consists of seven lights or divisions wide, and is so constructed as to bring in the three stained-glass windows of the former chancel, executed by Hardman. There are also two stained-glass windows, by Ward and Hughes, inserted in the north and south sides of the chancel. The arches between the transepts and chancel, and a window with reticulated tracery at the south end of the aisle, are exceedingly effective. The chancel and transepts externally are faced with Bromsgrove stone, and have a bold appearance, suggesting the continuation of the work westward to make it complete. The floors under the seats are laid with wood blocks, while the portion of the chancel within the altar rails is paved with Rusts glass mosaic of suitable design. The roofs are covered with green Westmoreland slate. Messrs. Collins and Godfrey, of Tewkesbury, are the contractors. The outlay has been between £2000 and £3000.

NOTTINGHAM.—The new Empire Palace and Music Hall, which has just been completed, was designed by Mr. Frank Matcham. The interior of the auditorium presents a gorgeous spectacle. The scheme of decoration is Oriental in character, and Indian methods in regard to Art have been largely drawn upon. The two boxes which flank the stage are surmounted by pagoda-like gilded domes, and two grinning idols, representing probably the Indian god Krishna, guard each side of the proscenium. The ceiling and circle fronts are resplendent with blue and gold colouring—the hues which are the predominating features of the scheme. Large models of elephants' heads stand out boldly at each corner, supporting the ceiling, and there are four huge tablets representing Indian tapestry, depicted in the peculiar colours which are characteristic of this material. Finely executed hand-painted designs upon various subjects are let into the ceiling here and there, and nearing the centre are more representations of Indian gods and sun rays, displayed in relief. Exactly in the centre is fixed a glass sliding roof, after the style of the Pavilion and Canterbury, among other London halls. This can be removed and replaced in the short space of time of half a minute, the mechanism being extremely simple. The adoption of this principle will enable the management to practically preserve an equable temperature all the year round. The heating apparatus is constructed upon the most recent

methods. The visitors to the grand circle and fauteuils are admitted from the street to a crush room. A wide and easy flight of stone steps leads to a well-appointed lounge, which extends from one side of the circle to the other. At each end is placed a cloak room. The staircase and lounge walls are covered with thick leather paper of handsome appearance, in maroon and gold. At the back of the grand circle a series of roomy boxes, similar to those at the London Empire, have been placed. The seats in the grand circle, stalls, and fauteuils are all on the best principle, upholstered in old gold plush, which imparts to the auditorium a very warm and comfortable appearance. The fauteuils are reached from the circle. The line of sight throughout the building is admirable, for there is not a seat in the theatre which does not command an uninterrupted view of the stage. The "pitch" of the seats in the circle, balcony, and gallery is very steep. Ample attention has been given to the exit doors. The stage is 35ft. wide, with a 30ft. proscenium opening. Mr. J. Greenman, in the position of resident clerk of the works for Mr. Matcham, has superintended the erecting of the music hall from the commencement.

QUANTON, BUCKS.—New schools are to be erected at Quanton, at a cost of £1747. The designs selected, in a limited competition, have been prepared by Messrs. W. F. Taylor and Son, of Aylesbury and Thame. The contractors are Messrs. King and Cannon, of Quanton, who have already entered upon the work.

RHONDDA VALLEY (Glamorganshire).—The Rhondda District Council has accepted the plans of Mr. W. D. Morgan, architect, of Ton Pentre, Rhondda Valley, sent in in competition, for an isolation hospital to be erected at Ystrad. Accommodation is to be provided for thirty-two patients, matron, nurses, and non-resident medical officer, with laundry, disinfecting, and discharging blocks, &c. The cost of the proposed scheme is estimated at about £10,000. Ten sets of designs were received.

STONEHAVEN.—A notable granite residence has just been completed at Stonehaven. It is erected on a fine site at the junction of Bath Street and Slug Road. The house is built in the Scottish baronial style of Architecture, the south and west elevations (which are the exposed ones) being built in Kemnay granite, and the ashlar rock-faced, with fine picked dressings. The front elevation is 72ft. in length, the centre turret rising to a height of 55ft. The roof is covered with Tiberthwaite green slates, and the ridge has a neat cast-iron cresting. The inside finishings are all of American poplar, known as canary weed, except the staircase, which is of pitch pine. The hall containing the staircase is lit by a large cupola from the roof, and forms one of the principal internal features; the public rooms are spacious and well appointed. The following contractors have carried out the various works: Mason work, Mr. George Gregory, Stonehaven; carpenter work, Messrs. R. Thomson and Sons, Stonehaven; slater work, Mr. Charles Maitland, Aberdeen; plumber work, Mr. A. Mathieson, Stonehaven; plaster work, Messrs. Scott and Sellar, Aberdeen; painter and glazier work, Messrs. Barron and Son, Aberdeen. The building was designed and carried out under the superintendence of Mr. J. Augustus Souttar, architect, Aberdeen.

WHITTINGTON.—A Congregational chapel has been erected at Whittington. The architect was Mr. Williams, Liverpool, while the work was carried out by Messrs. Griffiths and Son, of Ellesmere and Knockin. The building is in the Gothic style, and is of red Sweeney brick, with dressings of terra-cotta, and window traceries of Grinshill stone. It is 40½ft. long by 27ft. wide, and will seat about 180 persons. A vestry, with other out-offices, is attached, while in the rear space is left for the erection of a schoolroom.

Under Discussion.

ELECTRIC LIGHTING OF HOUSES.

Before the Architectural Section of the Philosophical Society of Glasgow—Mr. P. Macgregor Chalmers in the chair—Mr. William Arnot, electrical engineer, Glasgow, read a paper on "The Distribution of Electricity in the House." He went over in detail the different fittings in a house, and the different systems of wiring. He was of opinion that switches should not be spared, as they tend to reduce the annual bill for current. Fuses should only be placed in suitable boxes, and not scattered over the house in inaccessible places, even though the cost is a trifle more in such a system. He thought more taste could be expended on fittings, not so much brass, and more light, and that the positions of the lights should tend more to decorate a room rather than burden it.

EDINBURGH ARCHITECTURAL ASSOCIATION.

This Association held a visiting meeting on Saturday, going to Leith, when, by permission of the School Board, the Academy was inspected. Under the leadership of Mr. George Craig, the infant classrooms, juvenile classrooms, art rooms, lecture hall, chemical laboratories, physical and mechanical laboratories, and other rooms for a science college, cookery, sewing rooms, &c., were viewed, and the heating and ventilation on the Plenum system, put in by Mr. Key, of Glasgow, was also examined. Afterwards the visitors paid a visit to old Leith, under the direction of Mr. John Watson.

NEW ARCHITECTURAL SOCIETY AT ABERDEEN.

For some little time past steps have been in progress for the formation in Aberdeen of a Society of Architects. These have been brought to a most successful issue, and at the first annual meeting of the Aberdeen Society of Architects, held recently, the following office-bearers were elected:—President, Mr. James Souttar; vice-president, Mr. Arthur Clyne; hon. secretary and treasurer, Mr. John Rust; members of Council, Mr. William Kelly, Mr. A. Marshall Mackenzie, Mr. A. H. L. MacKinnon, Mr. George Watt, Mr. R. G. Wilson.

ENGINEERING SURVEYS.

At a meeting of the Liverpool Engineering Society, Dr. J. H. T. Tudsbery read a paper on "Engineering Survey Work." He said that he desired not to invite the attention of the society to what might be regarded as the artisan department in surveying—to land chains, wires, tapes, poles, &c., but to what extent scientific processes might be advantageously applied in their daily work. In dealing with the matter of accuracy he expressed the opinion that far too much weight was attributed to "average" results in survey work.

TIMBER FOR CONSTRUCTION AND DECORATION.

The monthly meeting of the Sheffield Society of Architects and Surveyors was held on the 8th inst. A lecture was delivered by Mr. Charles Castle, of Sheffield, on "Timber for Construction and Decoration." The lecturer pointed out that the variation of the seasons during the process of "seasoning," especially abroad, greatly effected the quality and consequent value of foreign deals, battens, and boards, either appreciating or depreciating them as the seasons were favourable or unfavourable. Mr. Castle passed in review some of the ordinary woods of commerce, such as spruce, pitch pine, yellow pine, red pine, &c. Then teak, Kauri, Oregon pine, mahogany, oak, and canary wood, pointing out their various characteristics, and showing in detail many interesting facts in relation to them. Some good specimens of the combination of various woods for decorative purposes were then shown, including yellow pine panels, and pencil cedar mouldings, teak and black wood mouldings, black wood and purple wood

mouldings, Kauri and mahogany ditto, mahogany panels and canary wood mouldings stained black, Padouk and black wood mouldings, Cuba mahogany panels and walnut mouldings, satinwood panels and purple wood mouldings, fumigated oak panels and brown oak mouldings, Cuba mahogany panels, and sycamore mouldings, stained black, canary wood stained walnut or mahogany. The lecturer said that teak was one of the most reliable and beautiful of woods. It had the advantage of standing artificial drying without casting, and it was most durable. Vessels built of teak nearly a century ago were afloat to-day in good condition. A plain varnished railway carriage of teak was instanced as an example of the beauty of this wood. Kauri was a wood also much praised for its beauty by Mr. Castle, who said that its natural colour was like plain satin wood, and used in decoration it would alternate with any darker wood. It was strongly recommended for first-class floorings, staircases, hand rails, and shop fronts.

THE BIRMINGHAM WATER SUPPLY.

At a meeting of the Birmingham Municipal Technical School Engineering Society, a paper on the Birmingham Corporation Welsh water supply was read by Mr. Cecil W. Tye, of the Water Department engineering staff. Mr. Tye, by a cross-section of the works, showed the position of the four dams under construction—viz., Caban Coch (122ft. high and 600ft. long), Careg-ddu (the submerged dam), Pen-y-Gareg (128ft. high and 525ft. long), and Craig Goch (120ft. high and 625ft. long)—and by a diagram pointed out the advantages in the special design of dam adopted by Mr. Mansergh, which gives an extreme factor of safety. By the aid of lantern views Mr. Tye was able to explain the methods adopted in dressing the stone for face work, the mixing of the concrete, and placing it in position. Samples of the stone quarried on the ground were exhibited. This stone is peculiarly tough and hard, and is very suitable for the purpose required. The best is dressed for facing work. Six special installations of stonebreakers are in use for breaking up the stone for concrete. About twenty-three locomotive steam cranes and a large number of hand cranes are in use in various parts of the works.

R.I.B.A.: THE ROYAL GOLD MEDAL.

At a special general meeting of the Royal Institute of British Architects, held on Monday, March 7th, the chairman, Mr. W. M. Fawcett, M.A., vice-president, moved that, subject to Her Majesty's gracious sanction, the Royal Gold Medal for the promotion of Architecture be presented to Professor Aitchison, R.A. The motion having been seconded by Mr. H. L. Florence, vice-president, it was carried *nem. con.*—At the ninth general meeting of the session, which followed the special meeting held on Monday, 7th inst., it was announced that the Council had resolved to increase the value of the Owen Jones Studentship from £50 to £100, and that the holder of the studentship would be required to make a tour extending over six months, such tour to be devoted to the improvement and cultivation of his knowledge of the successful application of colour as a means of architectural expression. The following candidates for membership were elected:—As Fellows: George Lethbridge [A.] and Edward Thomas Boardman (Norwich); As Associates: Laurence Hobson, William Charles Hulbert, John Ormrod, Dudley Christopher Maynard, Timothy Honnor, Harry John Pearson, F.S.I., Ralph Henry Morton, Herbert Shepherd, William McCulloch, John Frederick Duttoit, and Henry Albert Collins.

The foundation stones of a Bible Christian Chapel and Schools have been laid at Ford. The cost is estimated at about £6000.

A COUNTY meeting was held in the Chapter House at Lincoln Cathedral to discuss the feasibility of erecting a permanent memorial to the late Poet Laureate. A statue was suggested, but eventually it was decided that the memorial should take the form of a large stained-glass window in Lincoln Cathedral.

Enquiry Department.

IRON ROOFS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Can you tell me of any book on iron roof construction; giving stress diagrams of innumerable patterns? Mr. Drew's articles in your Journal are brief; I have been through them.—Yours truly,

J. A. T.

There are many books on iron roof trusses; but you appear to want the stress diagrams rather than a general treatise. Perhaps the following would suit your purpose: "Bridges," Stresses in girder and roof trusses, for both dead and live loads; Part I, Girders; Part II, Roofs; with over 100 stress diagrams; by F. R. Johnson, A.M.I.C.E.; E. and F. U. Spon; 1 vol., 6s. "The Design of Structures," with numerous diagrams and tables, by S. Anglin, M.E., Dub.; C. Griffin and Co., Ltd., 16s. "Stresses and Thrusts," by G. A. T. Middleton, A.R.I.B.A.; B. T. Batsford, 4s. 6d.

EXTERNAL WALLS OF DOMESTIC BUILDINGS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—The construction which the District Council (referred to in your issue of February 16th) put upon their bye-laws with regard to external and party walls of domestic buildings is undoubtedly correct, and in accordance with the usual practice. If the height of any story is over 10ft., no matter whether that story be the ground floor of a two-story building or the top story of a high building, its walls must be at least 13½in. thick, the point being that under sub-section (k) 10ft. is the maximum height of 9in. wall which may stand alone, i.e., unaided by the lateral support

FIG. 1.

FIG. 2.

FIG. 3.

FIG. 4.

of a floor. Fig. 1 shows a case in which full advantage is taken of (a) without infringing (k). It is to be noted that (k) is a restriction on all the preceding sub-sections which allow 9in. walls; for instance, Figs. 2 and 3 show the upper part of a wall under the sub-section dealing with walls of domestic buildings between 30ft. and 40ft. high. The top story may be built with a 9in. wall if as in Fig. 2, but if the floors are disposed as in Fig. 3, sub-section (k) comes into operation, and the top story wall must be 13½in. thick. Even if the building be only one story high, the wall must be at least 13½in. thick if that story be above 10ft. in height, as, for example, in Fig. 4.—I am, dear Sir, your obedient servant,

LEWIS E. G. COLLINS.

WIND PRESSURES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I should be glad of a solution to the following questions: (1) According to the tables in Hurst P. 139, taking 45 deg. as inclination of surface of a roof, and wind pressure at 40lb. = P, ("pressure of wind in pounds per square feet against a surface perpendicular to its diversion") we have

$$P_n = 36$$

$$\frac{P_h}{P_v} = 25.5 \text{ about } e$$

What is the correct graphic representation of this showing original wind pressure P? (2) In Molesworth P. 98, "Load on Roofs," Load

for pressure of wind 36cwt. per 100 super. feet. Does this weight represent the pressure P. (in my first question), or P_n the normal? What is the best book on this subject, i.e., graphic statics in regard to roofs—wind pressure diagrams worked out—and dead weight, etc.—Yours obediently,

"A STUDENT."

The practice with regard to wind pressures on roofs is differently stated by different authorities. Some always calculate for the maximum horizontal wind pressure, taking this at 40lb. per vertical foot super. Others use the equivalent normal pressure as given by Rankine, and quoted by Hurst. Others assume that the ordinary pressure of 40lb. per foot super is depressed at an angle of 30 deg. with the horizon, as it occasionally is in a high eddying wind. Against all these, Professor H. Adams proved conclusively, in a paper read before the Society of Architects some years ago, that if a dead load of 60lb. per foot super (horizontal) be calculated for, the same roof, to all intents and purposes, is arrived at as if the dead loads and wind pressures were each taken at 40lb. Possibly you would follow the subject best by reading Middleton's "Stresses and Thrusts" (Batsford).

WILLESDEN ROOFING PAPER.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Can you give me any information about the Willesden waterproof paper for use in laying under zinc (boarding also being used) for a roof, as compared with roofing felt? Which is preferable? Thanking you in anticipation, I am, Sir, faithfully yours,

B. A.

The advantages of Willesden paper as compared with roofing felt are that the former is waterproof, rotproof, and insect-proof, it is

also to a great extent fire resisting, it has no smell when subjected to heat, does not perish, as does felt, and, being a lead conductor, will keep a building cooler in summer and warmer in winter. For these reasons it is much to be preferred to felt, although its first cost is slightly above that of the latter.

MODEL LODGING HOUSES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would you kindly inform me through your paper if there is any book to be had relating to model lodging houses?—Yours faithfully,

"ARCHITECT."

It is better, remembering the stringent regulations imposed with regard to model lodging houses, to study plans of buildings of this kind already erected. Such study, in conjunction with a review of the local bye-laws, would guide you considerably. Much valuable information can be obtained from "The Municipal and Sanitary Engineer's Handbook," by H. Percy Boulouis, M.I.C.E., late city engineer, Liverpool. E. and F. N. Spon, 15s.

THE North Bierley District Council has resolved to apply to the Local Government Board for sanction to borrow £9500 for the purpose of laying out a new cemetery. It is proposed to spend £2000 on the provision of one chapel, and £1000 on a lodge and out-buildings.

Trade and Craft.

CHANGES OF ADDRESS.

Mr. Owen W. Davis, architect, whose address has hitherto been 1, Caroline Street, Bedford Square, W.C., notifies us of his removal to 27, Rutland Street, Hampstead Road, N.W. Mr. Herbert G. Ibberson, A.R.I.B.A., and Mr. T. P. Figgis, A.R.I.B.A., have both removed to 28, Martin's Lane, Cannon Street, E.C.

MESSRS. T. AND R. BOOTE, LTD.

Messrs. T. and R. Boote, Ltd., of the Patent Tile Works, Burslem, are removing their London office from Waltham Buildings to more convenient premises at Birkbeck Bank Chambers, Southampton Buildings, Holborn, E.C. The change takes place on March 25th, and will no doubt be duly appreciated by their customers, whose wishes will as heretofore be attended to by Mr. Thomas Foster, the agent of the firm. Messrs. Boote have recently completed some important contracts for tiling, amongst which are the Blackwall Tunnel, Rangoon and Pretoria Government offices, and almost the whole of the interior of Birkbeck Bank Buildings, on which these offices will in future be situated, and which will therefore be a permanent specimen of their work.

MESSRS. WILSON AND CO.

The 1898 catalogue of Messrs. Wilson and Co., of 24, Harrison Street, Gray's Inn Road, W.C.—whose patent dioptrical pavement and floor lights have now been generally recognised as possessing the maximum advantages as light projectors—fully illustrates the latest developments in pavement light engineering. We have already described the firm's dioptrical lights, which, whilst possessing the reflective power of the semi-prism, have also the dioptrical effect of the concave lens in diffusing the light over a much greater area; we would therefore refer only to the other patented improvements which are the result of Messrs. Wilson's long experience. A very acceptable non-slippery pavement light seems to be forthcoming in their "Safety" patent. The upper portions of the frames are entirely of lead; the surface thus affords a firm and even hold for the foot, and the general appearance is superior to that of the ordinary lights. An improved cellar flap, illustrated in the catalogue, deserves notice. These flaps are made folding, and are hung on centres in a strong cast-iron, guttered frame, and form a perfectly water-tight illuminating covering for all kinds of openings. In appearance and in durability they are far in advance of the usual wooden flaps. Messrs. Wilson also illustrate several patterns in ornamental tile and glass pavements, which are especially suitable for entrances, vestibules, &c. An improvement on the ordinary illuminating stair-treads and risers is also shown.

It is stated that there is no foundation for the reports which have recently been published to the effect that a portion of the grounds of Chiswick House is in danger of being built upon.

SIR ARTHUR BLOMFIELD has furnished a beautiful design for a chancel screen to be erected in St. Mary's Church, Mortimer, near Reading, in memory of the late Mr. Richard Benyon, of Englefield House.

THE Belgian Department of Railways having decided on the construction of a bridge across the Scheldt at Hoboken, a few miles below Antwerp, the well-known engineer, M. Van den Broeck, is to make a tour in America in order to study large railway bridges in different parts of the United States.

A MONUMENT of Mrs. Gaskell has been erected in the little Cheshire town of Knutsford. A bust in bas-relief, executed by an Italian artist, Cavaliere Achille d'Orsi, has been let into the wall of the Post Office, near the entrance into Tatton Park, and at the base of the figure there lies a copy of "Cranford," with a quill pen and a laurel wreath. The monument is wrought in bronze.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

AYLESBURY (Bucks).—For alteration and addition to the "Railway Hotel," Aylesbury. Mr. Guest Luckett, architect, Aylesbury:—
Kingerlee and Sons .. £2,497 .. Senior & Clarke, Wende-
Sherwin .. 2,300 .. over (accepted) .. £2,100
Kimberley .. 2,180 .. Grimsdale .. 1,849
Net amount of tenders after allowing for old materials in existing house.

BANGOR.—Hamilton-road Presbyterian Church, Bangor, co. Down, for the Committee of the Church. Mr. W. J. W. Roome, architect, Belfast:—
Robert Caldwell, Bel. .. £3,195 .. James Kidd, Belfast .. £7,294
John Lowry and Son, .. 7,975 .. James Colville, Bangor .. 6,591
Belfast .. 7,975 .. * Accepted for first blocks.

BELFAST.—Shankhill-road Mission Buildings, for the Committee of the Mission. Mr. W. J. W. Roome, architect, Belfast:—
John Lowry and Son, .. £16,972 .. W. J. Campbell & Son .. £13,454
Wm. G. Callen .. 15,000 .. Courtney and Co. .. 13,249
McLaughlin & Harvey .. 13,590 .. * Accepted.

BELFAST.—Villa, Adelaide-park, Belfast, for Mr. Wm. Clarke. Mr. W. J. W. Roome, architect, Belfast:—
W. McConnell .. £1,246 .. J. Killen .. £1,187
R. George .. 1,150 .. R. Crawford (accepted) .. 940
[All of Belfast.]

BIRMINGHAM.—For the extension of sewerage works, Baldwin-lane, &c., for the King's Norton Rural District Council. Mr. A. W. Cross, C.E., 23, Valentine-road, King's Heath, Birmingham:—
Jacob Biggs .. £2,865 0 0
Jones and Fitzmaurice .. 2,804 0 0
Curral, Lewis, and Martin .. 2,660 7 8
Geo. Trentham, 24, Heathfield-road, Handsworth, Birmingham (accepted) .. 2,395 0 0
[Engineer's estimate, £2,501 11s.]

BISHOP'S STORTFORD.—House and shop, for Mr. C. E. Smith. Alfred Brett, architect, Bishop's Stortford:—
F. Cannon .. £585 .. Glasscock and Son .. £559
C. Martin .. 569 .. A. Levey .. 550

BRIGHTON.—For the supply of granite kerb, &c. Mr. F. J. C. May, C.E., Town Hall, Brighton:—
Flat granite .. 6in. by 4in.
kerb at per .. granite pitchers
foot run. .. at per ton.
s. d. s. d.
A. Robinson .. 1 11 .. 1 7 6
J. Goodchild and Co., 118, Fenchurch-street, E.C. .. 1 44 .. 1 7 0
J. Gordon and Sons .. 1 13 .. 1 9 6
E. J. Van Praagh and Co. .. 1 53 .. 1 11 0
Blighfield and Co. .. 1 44 .. 1 11 6
A. and F. Munnell, 101, Leadenhall-street, E.C. .. 1 71 .. 1 15 2
J. Mowlem and Co. .. 1 84 .. 1 16 3
W. Griffith .. 1 84 .. 1 16 3
* Accepted for 2,000 ft. of kerb and 400 tons of pitchers.
† Accepted for 1,000 ft. of kerb and 100 tons of pitchers.

BYFLEET (Surrey).—For the erection of a village hall and club, for the committee. Messrs. Ashley and Armstrong, architects:—
Jno. Anderson .. £2,693 .. B. Ingram and Co. .. £2,376
Goddard and Son .. 2,693 .. J. Hunt, Chertsey .. 2,222
Mitchell Bros. .. 2,520 .. * Accepted.

COVENTRY.—For new roads and drainage works, Edgewick, Foleshill, Coventry, for Messrs. Peach Bros. Messrs. Harrison and Hattrell, surveyors, Coventry:—
J. Isaac and Son, .. £1,589 7 6 .. McCarthy & Co. .. £1,244 10 0
T. G. Golby .. 1,420 0 0 .. H. Mason & Son .. 1,242 13 5
Kelley and Son .. 1,260 0 0 .. * Accepted.

EASTBOURNE.—For the erection of a house and shop. Mr. W. H. Raffles, architect, 9, Argyll-street, Regent-street, London. Quantities by Mr. B. Swinstead, 22, Wellington-street, Strand, W.C.:—
Jas. Carmichael .. £1,343 6 2 .. G. Bainbridge & Son .. £1,239 2 5
James Peersless .. 1,340 0 0 .. Son .. 1,239 2 5
M. Martin .. 1,300 0 0 .. * Accepted.

EPSON.—For erecting Conservative Club. Mr. F. W. Ledger, architect:—
Barker .. £2,150 0 0 .. Nottell .. £1,849 0 0
Irwin .. 2,116 0 0 .. Burrage .. 1,839 0 0
Horwood Bros. .. 2,013 13 9 .. Wells .. 1,797 0 0
Holdsworth .. 1,962 0 0 .. Hart .. 1,757 0 0
Potter .. 1,885 0 0 .. * Accepted.

FAWKHAM (Kent).—For the erection of a house. Messrs. Ashley and Armstrong, architects:—
Thomas Knight .. £1,109
House .. 69
Conservatory .. 69
Total .. £1,168
House .. £1,078
Conservatory .. 75
Total .. £1,153
House .. £1,053
Conservatory .. 65
Total .. £1,118

HANLEY.—For erecting Dix's Brewery. Messrs. R. Scrivenner and Sons, architects, Hanley:—
J. Wilton .. £4,939 .. G. Ellis .. £4,670
H. P. Embrey .. 4,895 .. T. Godwin, Hanley .. 4,668
Tomkinson & Betteney .. 4,883 .. C. Cornes .. 4,445
Bennett Bros. .. 4,768 .. J. Bagnall .. 4,425
J. R. Foxall .. 4,750 .. J. Cope .. 4,300
* Accepted.

LISBURN.—Extension of Rosevale Home Laundry, for Mr. T. J. Porter. Mr. W. J. W. Roome, architect, Belfast:—
D. McHenry, Dun- .. £2,432 .. Lisburn (accepted) .. £1,800

LONDON.—For the erection of two warehouses on a site at the corner of Golden-lane and Hatfield-street, E.C., for Mr. W. R. Sutton. Mr. John Groom, architect. Quantities by Mr. Henry Theobald, 48, Finsbury-pavement, E.C.:—
Mowlem and Co. .. £17,258 .. Mattock Bros. .. £15,791
Downs .. 16,278 .. Kilby and Gayford .. 15,736
B. E. Nightingale .. 16,355 .. J. Greenwood .. 15,637
Woodward and Co. .. 16,327 .. Grover and Son .. 15,468
Lawrence and Son .. 16,200 .. H. L. Holloway .. 15,440
Stimpson and Co. .. 16,149 .. * Accepted.

LONDON.—For rebuilding Nos. 9 to 27, Fitzroy-place, N.W. Mr. A. E. Hughes, architect:—
Woodward .. £7,559 2 6 .. Higgs and Hill .. £6,984 3 0
Williams .. 7,425 2 6 .. Chessum .. 6,919 2 0
Hall Beddall .. 7,374 1 0 .. Downs .. 6,683 3 0
Shurmer .. 7,247 2 0 .. Faulkner .. 6,527 2 6
Webber .. 7,080 2 6 .. * Accepted.

LONDON.—For the erection of St. John's Park Mansions, Tuffnell Park. Mr. S. Perks, architect:—
Lidstone .. £7,358 .. Symes .. £6,650
W. Shurmer .. 6,984 .. Johnson .. 6,494

LONDON.—For alterations and additions to the "Windmill" public-house, Uxbridge-road. Mr. H. J. Wakley, architect:—
Higgs .. £3,700 .. Shurmer .. £3,194
Scrivenner .. 8,563 .. Antil .. 8,100
Patman & Fotheringham .. 8,395

LONDON.—For rebuilding the "Freemasons' Arms" public-house, Kensington. Messrs. Bird and Walters, architects:—
Joslin and Young .. £3,670 .. Beer and Gash .. £7,725
Williams and Sons .. 8,150 .. Tomms .. 7,719
W. Shurmer .. 7,990 .. J. E. Todd .. 7,690
Lowell and Lightfoot .. 7,943 .. Ance .. 7,660
Lawrence .. 7,889 .. Burman .. 7,598

LONDON.—For rebuilding the "Thomas a Becket" public-house, Old Kent Road. Mr. R. Wilcocks, architect:—
Lascelles .. £11,678 .. Kilby and Gayford .. £11,035
Stimpson .. 11,560 .. Eddie .. 10,748
Maddison .. 11,526 .. Patman and Fotheringham .. 10,195
Shurmer .. 11,152
Antil and Co. .. 11,145

LONDON.—For erecting a factory, St. Paul's Wharf, Shadwell. Mr. G. Drew, architect:—
Clarke and Bracey .. £4,837 .. Patman and Fotheringham .. £4,596
Yerbury .. 4,720 .. Ashby and Horner .. 4,488
C. Cox .. 4,669 .. Wood .. 4,487
W. Shurmer .. 4,634 .. Higgs and Hill .. 4,484
Nightingale .. 4,630 .. Harris and Wardrop .. 4,397

LONDON.—For building a factory, Golden-lane. Mr. J. W. Stevens, architect:—
Reason .. £4,827 .. Stimpson and Co. .. £4,373
Shurmer .. 4,662 .. White and Co. .. 4,335
Leath and Harris .. 4,533 .. Castle .. 4,248
Mattock Bros. .. 4,532

LONDON.—For alterations, &c., to the "Island Queen" public-house, Pentonville. Mr. H. H. Tasker, architect:—
E. Lawrence and Son .. £3,488 .. Edwards and Medway .. £3,347
Barrett and Power .. 3,474 .. Beer and Gash .. 3,171
W. Shurmer .. 3,450 .. Hunt and Son .. 2,536
Willmott and Sons .. 3,388

LONDON.—For the erection of two warehouses on the site of Nos. 40, 42, 44, and 46, Scrutton-street, Shoreditch, E.C., for Mr. W. B. Sutton. Mr. John Groom, architect. Quantities by Mr. Henry Theobald, 48, Finsbury-pavement, E.C.:—
W. Downs .. £10,490 .. H. L. Holloway .. £9,473
Scrivenner and Co. .. 10,376 .. Grover and Son .. 9,442
B. E. Nightingale .. 9,985 .. J. Greenwood .. 9,368
Kilby and Gayford .. 9,736 .. Mattock Bros. .. 8,977
Stimpson and Co. .. 9,600 .. * Accepted.

LONDON.—For pulling down and rebuilding Nos. 5, 6, and 7, Singer-street, Shoreditch, E.C., for Mr. A. Flint. Mr. John Groom, architect. Quantities by Mr. Henry Theobald, 48, Finsbury-pavement, E.C.:—
Stimpson and Co. .. £7,770 .. Lawrence and Son .. £7,362
Kilby and Gayford .. 7,736 .. J. Greenwood .. 7,261
H. L. Holloway .. 7,636 .. Grover & Son .. 7,226
Mattock Bros. .. 7,391 .. * Accepted.

LONDON.—For rebuilding "The Eagle" public-house, Chobham-road, Stratford, E., for Messrs. Savill Bros., Limited. Mr. Henry Poston, architect, 39, Lombard-street, E.C. Quantities by Messrs. R. L. Curtis and Sons:—
J. and H. Cocks .. £6,350 .. Hearle and Farrow .. £6,328
Gregar and Sons .. 6,750 .. A. Read .. 5,996
W. J. Maddison .. 6,550 .. G. E. Todd and Co. .. 5,933
* Accepted.

LONDON.—For the erection of a warehouse on a site in New-street, at the corner of Hatfield-street and French-alley, Golden-lane, E.C., for Mr. W. R. Sutton. Mr. John Groom, architect. Quantities by Mr. Henry Theobald, 48, Finsbury-pavement, E.C.:—
Downs .. £8,890 .. Mattock Bros. .. £8,585
Stimpson and Co. .. 8,700 .. Kilby and Gayford .. 8,536
Patman and Fotheringham .. 8,621 .. B. E. Nightingale .. 8,447
Ingham .. 8,600 .. Grover and Son .. 8,436
H. L. Holloway .. 8,600 .. J. Greenwood .. 8,383
* Accepted.

MACCLESFIELD.—For alterations to school buildings, for the Corporation. Mr. James Stevens, architect, Brook Bank Macclesfield:—
Roylance and Co. Ltd. .. £3,600 .. A. Frish, Macclesfield .. £2,876
Hulse .. 3,292 .. J. Matthews .. 2,537
Cotterill .. 3,233 .. * Accepted.

MIDDLETON (Lancs.).—For the erection of a branch store and three dwelling-houses, &c., Mills Hill, for Middleton and Tonge Co-operative Society. Mr. F. W. Dixon, architect, Travelyan-buildings, Manchester:—
William Pollett .. £1,444 10 10 .. Jonathan Parting .. £1,385 0
E. Partington & Sons .. 1,440 0 .. ton .. 1,374 10
Grundy and Co. .. 1,420 0 .. F. Jackson and Sons .. 1,374 10
* Accepted.

MORECAMBE.—Accepted for new church, Sandylands, Morecambe. Messrs. Austin and Paley, architects, Lancaster:—
J. Edmondson, Morecambe .. £3,911

NEATH (Wales).—For the erection of schools, Gnoil Park-road, for the School Board. Mr. J. Cook Rees, architect, St. Thomas's-chambers, Neath. Quantities by architect:—
Howells Bros. .. £12,032 .. Walters and Johns .. £11,150
Morgan Cox .. 11,998 .. A. George .. 11,121
Watkin Williams .. 11,699 .. Wm. Daniel .. 11,060
D. E. Davies .. 11,600 .. John Rees .. 10,989
Henry Billings .. 11,550 .. D. Jenkins .. 10,989
Thomas Watkins .. 11,235 .. J. Davies .. 10,670
Edward Groom .. 11,160 .. C. and F. Gaen, Port Bennett Bros. .. 11,150 .. Talbot (accepted) .. 10,580

PLYMOUTH.—For the erection of blocks of dwelling-houses, Howe-street, &c., for the Corporation. Mr. J. Paton, Borough Engineer, Municipal Offices, Plymouth:—
Shellabear and Son .. £19,820 .. A. N. Cole .. £17,716
H. E. Skinner .. 18,819 .. W. E. Blake .. 16,737
T. May .. 18,780 .. W. Trevena .. 16,200
Pethic Bros. .. 18,482 .. Wakeham Bros. .. 16,159
Goad and Co. .. 18,472 .. * Accepted.

SOUTH SHIELDS.—For rebuilding the "Britannia" Hotel, Charlotte-terrace, for Messrs. J. Rowell and Son, Limited. Mr. J. W. Donald, architect, Russell-chambers, South Shields. Quantities by Mr. J. P. Allen, Newcastle:—
J. and W. Lowry .. £4,378 0 0 .. W. H. Brown .. £3,696 14 5
N. W. Maughan .. 4,285 19 9 .. S. Shariff .. 3,695 0 0
J. C. Hope .. 3,995 0 0 .. R. Harper .. 3,645 4 8
J. Moore .. 3,963 0 0 .. E. Allison, Whit-W. Christie .. 3,820 3 0 .. burn .. 3,568
W. B. Ingram .. 3,808 5 7 .. * Accepted.

The New Government Offices. "We have to build not only for temporary needs, but for posterity. We have to beautify London with edifices which shall satisfy the æsthetic tastes of ourselves and those who shall come after us, and be a perpetual source of pleasure and glory for men claiming to belong to 'no mean city.'" This is the moral laid down by

Office is at the present time located in eleven different houses, whilst the Board of Trade occupies eight or nine, and the Home Office, the Local Government Board, and the Education Department are also inconveniently accommodated. In reading the scheme as laid before Parliament, one important matter stands out ominously. There is to be no competition for the design or for the ground plan. The work is to be relegated to the official architects, and outside skill is to forego its opportunity. The reason alleged, of course, is that architects beyond the Governmental sphere have not a sufficiently intimate knowledge of the interior requirements of the various Departments. "Outside architects," says Mr. Labouchere in effect, "might give us a thing of beauty in exterior design, but in interior inconveniences it would be an abomination for ever." Mr. Labouchere would no doubt point to the Foreign Office in support of his theory. But the defects there are easily avoided in future, and it is a matter for regret that the Government will not avail itself of the greatest architectural skill of the day. We look forward to the result with grim forebodings.

A CERTAIN commentator on Thoreau, Hardy Jeffries, and other writers—who have apostrophized the life of the fields, of the hills and hedgerows, and the sounds native to the woods and moorlands—has pleasantly illustrated how variant are the ways in which Nature appeals to the mind and emotions of mankind; but no one, perhaps, has put this quite so sympathetically as that monkish chronicler of the middle ages who likened men's souls to many stringed instruments over and through which Nature carelessly plays, until the soul realises, selects, and recreates in its own way beauty or ugliness. . . . To the modern architect, whose work lies in the heart of a great city, Nature appears too remote to influence his thought in any way, even if he occasionally takes a day in the country lanes, or makes a short stay in the neighbourhood of Hardy's Wessex. He has become so saturated with the forms of the past that the hints Nature continually offers are rejected unconsciously, his mind—cramped with mouldings,

A STUDY FROM THE LIFE. AT THE ARTS AND CRAFTS SCHOOL, REGENT STREET.

the Telegraph, and the occasion which has unearthed it is the debate on the new Government Offices scheme. How far is the ideal likely to be realised? We confess that the experience of recent years does not inspire confidence. Architectural works of the first magnitude which have been carried out in London during the past few years have one and all been severely maligned—and, perhaps, for the most part, rightly so. Whether it be New Scotland Yard, the Law Courts, the Albert Hall, the Whitehall Offices, the new Admiralty, or railway termini—all alike have served, in the hands of many, to discount the architectural skill of the later Victorian era. Now a new enterprise of national importance is on foot. Driven by dire necessity, the Government has embarked upon the expenditure of two and a half millions in providing proper accommodation for various Governmental Departments, propounding a scheme which, by widening Parliament Street, will improve one of the approaches to Parliament, and, by the erection of noble façades, "add very largely to the architectural beauty of the Metropolis." The necessity for the undertaking is shown by the fact that the War

Whether the design of the new offices will harmonise with the Gothic of the south or with the pseudo-classic of the north of Charles Street seems to be a matter of concern only to Sir William Harcourt. The assertion of the Leader of the Opposition that "it would be impossible to conceive places less adapted for the purpose for which they were intended" than the great block of buildings between Whitehall and St. James's Park is not to be gainsaid; but that utilitarianism which demands the greatest attention to internal planning should not look indifferently upon architectural dignity and beauty. It is much, however, that the Government is about to augment London's Architecture. London is perhaps poorer in handsome streets and architectural beauties than in anything else: in this respect we are out-rivalled by many third or fourth-rate cities abroad. We hope, therefore—in face of our fear—that the authorities will see to it that the new public offices shall be worthy of the premier city of the world, for it cannot be beyond the ability of our best architects to give to the country a building which shall combine interior convenience with exterior beauty.

H. C.

windows, doors, each in their special pigeon-hole, and numbered like a manufacturer's list of mouldings, ready for use when occasion calls—rejects the suggestions of the external world. Of all the architects to whom we turn with pleasure in these unregenerate days none have loved Nature in such a whole-hearted fashion as the late J. D. Sedding, and, whenever circumstances contrive to land the wayfarer in the vicinity of Sedding's churches, he knows that somewhere amid the old, will peep out (as he puts it in his work on Art and Handicraft) that "mingled charm of land and sea; the wild sea board, the noble cliffs, the romantic savagery of the moors—the interest of grotesque shapes of signs of old welter, of Nature's grand improvisations in the prodigious days when she hurled the rocks from height to height, threw up tall, pinnacled fortresses by the edge of the sea, fashioned solemn sanctuaries, carved headlands into whimsical shapes, cut bridges and chains for the giants out of the solid rock, scooped out uncanny caves and monster granite basins or daintily poised the logan rock." Sedding is here writing of Cornwall, but whether we find ourselves on the moorlands in the north,

the downs of Wiltshire, or among the hills and valleys of Devonshire, each locality appeals to the mind in its own particular way and has its own suggestions for the architect. Some day, says Sedding, an English Baron Hausmann will appear, and transform the slums of our manufacturing towns; but if that means reducing our street Architecture to the unvarying monotony of modern Paris, then from such a catastrophe let us be delivered. Jeffries, in writing of Paris, says: "The street Architecture of Paris consists of two parallel lines. In sunshine and shade the sides of the street approach in an unvarying ratio. A cloud goes over and the lines do not soften. The Architecture conquers—is always architectural—it resists the sun, the air, the rain, being without expression. The houses seen from one end present precisely the same façade as they did at starting. Each house is exactly the same height as the next. Nothing projects, no bow window, window balcony, or gable." It is all very dull and respectable. "All geometry and white paint." This is possibly exaggerated, but the more we understand the peculiar "localness of English Art" the less shall we be able to contemplate with equanimity the use of forms and fancies that have not, to quote Sedding again, "a tang of the soil." G. L. M.

**"Julius Cæsar,"
Artium Magister."**

"With scene-painting like that, this Princess's Theatre might do more for Art-teaching than all the galleries and professors of Christendom."

JOHN RUSKIN.
Feb. 16, 1884.

It was in a letter to a popular actor-manager, anent the production of "Claudian," that the author of "Modern Painters" wrote the above sentence, the importance of which it is difficult to over-estimate. To every student and lover of Art such words, from such a man, must conjure up visions of possibilities which it were well not to undervalue. The production of "Claudian" is so identified with the name of the late Mr. E. W. Godwin, that architects, as a body, should be particularly enthusiastic over any stage representation which furthers the Art which Mr. Godwin did so much to enhance. Fourteen years have elapsed since he designed the scenery and costumes for the production of "Claudian" at the Princess's Theatre—fourteen years which have produced countless representations of plays mounted with a lavish hand, and furnished us with some exquisite examples of scenic art. There can be no doubt that in the art of scene-painting England is paramount among nations. No one can approach her in the stage scenery which is furnished by artists like William Selbin, Hawes Craven, Walter Hann, W. R. Beverley, and others. But it requires more than a scenic artist to make a stage picture, and it is for this reason that names like those of E. W. Godwin and Alma Tadema claim the gratitude, not only of the ordinary playgoer, but of everyone who desires to educate the taste of the great British Public. It is therefore with gratitude that we turn to Mr. Tadema and to Mr. Tree, for giving us, in the present production of "Julius Cæsar," pictures which not only charm our eyes with their exquisite beauty, but satisfy us by their archaeological correctness. It is not often, even in these days, that we get a theatrical manager to incur such an enormous outlay of time and money as Mr. Beerbohm Tree has done in this production. Although little encouragement is given to managers of a theatre to stage their plays correctly as well as artistically—the public as a rule being entirely indifferent on the subject, yet it is impossible to imagine that a production like Julius Cæsar will not bear fruit, the fruit

which John Ruskin predicted fourteen years ago. Scenes like "The Senate House," "Brutus's Orchard," and "The Forum," leave an impress on the mind which is not easily erased. It seems imperative for architects to visit this great production—such an education in vistas, grouping, and colour, dare not be neglected. Amid the strange mistakes and incongruities of most stage pictures, even those produced by the very best of our theatrical managers, "Julius Cæsar" stands well-nigh flawless. The great blemish in the last act, where a futile attempt is made to realise a battle-scene on the plain of Philippi, is easily passed over in the pleasure of the preceding pictures. Mr. Tree has already given a professional *matinée*. One wonders if the Royal Academy, or Architectural Association, could summon up the energy to arrange a performance for Art students. One thing is certain, there would be no lack of enthusiasm amongst the members of the audience. H. S. M.

**PICTURES OF MODERN DUTCH
ARTISTS.**

"PICTURES of Modern Dutch Artists" constitute the present exhibition at the Hanover Gallery. It is curious to note how the fame of the Netherlands of to-day grows and grows in England, sober in general tone as is their luminous colouring, sad and solemn as are their everyday subjects and their realistic landscapes. No modern school sacrifices so little to catch the suffrages of the less artistic section of the public, or shows more real power with less of mere bravura. "The Silver Moon," though rather metallic in quality, is one of the best of Mesdag's later works. He here devotes himself almost exclusively to the loving study of sea and sky, and luckily refrains from stocking his picture with those fishing boats which, Dutchman though he is, he manages so ill, and places with so imperfect an instinct for composition. We doubt, however, whether the picture at the Hanover Gallery is rightly named. A noble production of Josef Israëls' old age is the important canvas, "Carrying the Anchor," which looks much better than it did two years ago, on its first appearance at the Salon of the Champ de Mars. Superb is the onward movement of the two weather-beaten fishermen, who wade through the surf bearing shorewards the anchor of their boat; admirably true the agitated movement of the cheerless grey sea, with its foaming white crests. The impression conveyed is that of unintermitting toil, patiently yet sadly borne, of perpetual joyless battle with the crushing forces of Nature. In the famous "L'Homme à la Houe," of Jean-François Millet, the central impression given is of the same order; but it is there underlined with a much more deliberate emphasis. And, moreover, there we may read beneath submission a mute revolt. By Mauve is a powerful sketch, "The Labourer," which distantly recalls, though less in design than in spirit, this very picture by Millet. Bosboom has all the air already of a Dutch "old master"; "A Dutch Church" here is a capital example of his undemonstrative, yet very genuine, Art. The large example of Artz, "By the Sea"—one of the humble love-idylls that modern painters dearly love to render—is relatively poor and expressionless; it is made clear that his charm evaporates when he is dealing with figures on something like the scale of life.

THE result of the poll which has been taken at Plymouth in regard to the Corporation's proposals to effect improvements in the harbour (or Cattewater), and make docks, wharves, &c., at a cost of upwards of a million pounds, has been made known. Approval of the scheme has been expressed by 8778 voters, whilst 5933 voted against it.

**EXAMPLES OF GREEK
AND
POMPEIAN DECORATIVE WORK.**

By J. C. WATT.

THE drawings reproduced in this book have been made with great care and delicacy, and are in most cases excellent. They are many of them the full sizes of the originals, and are accompanied by sections of mouldings and detailed measurements when smaller, so that it would be possible in many cases to make reproductions from them of the objects illustrated. The Pompeian section contains many drawings of tall candelabra and vases, made of bronze and damascened with copper and silver, which have most of them been published in the Museo Borbonico, though not with the complete detail which Mr. Watt gives. One of the most successful is the two-page plate, No. 58, which shows a bronze vase inlaid with silver and with handles formed of two much convoluted stems which spring from two female heads affixed to the lower part of the body of the vase, the complicated and involved curves of which are rendered with great precision and success. Full size sections of all important parts are given on the same plate. One sees both in this part of the book, and in the Greek section, how much variety was allowed, not only in detail but in general proportion, and not only in the ornament of less architectonic decoration but in capitals, in the proportion of mouldings and in their enrichment. The purist may call the work debased, but it shows that the style was living and more elastic than the later Renaissance architects would allow. Examples are given of Ionic capitals showing the greatest variety in the spacing, in the proportions of the volutes to the mass, and in the construction, while on plates 1 and 2 are sections of mouldings from Olympia, some of which are barely recognizable as Greek. The motifs of the sculptured ornament are few, but Mr. Watt gives sufficient examples to prove that they, too, could be treated in many ways, and the addition of colour, to which considerable attention is given, must have enabled the designer to obtain any desired variety in effect. The colours used were few in number—black, brown, and buff, or black and reddish-brown, or deep purple, black, and olive-green on a buff ground, or an olive-green and claret-red on white marble, with circles of salmon-red; in only one case has a trace of gilding been noted used in conjunction with green. All these colours are low-toned and rather sober, and the effect must have been rich and splendid. In connection with this matter of colour, the pavements in Opus Signinum from Pompeii may be mentioned (Plate 40), a kind of work which is suggestive for use now-a-days. Into a red cement ground, black and white tesserae are inserted in delicate meander and interlacing patterns, varied by spot and scale fillings. The tesserae are about $\frac{3}{16}$ in. square, and are set anglewise upon the line. This is a mode of flooring which might be used in entrance halls with very good effect. It is curious to note how the direction of decorative design changes with the centuries, so that what once appeared the obvious thing to do is held to be dull if not indeed inadmissible. No designer would now produce the extraordinary mixture of human and animal forms, which, in Roman times, so often did duty for the terminations and commencements of the handles of vases, etc., of which Mr. Watt gives some examples. Again, the feet of tripods, candelabra and braziers, show a great lack of invention, and to our eyes very often an awkwardness of composition, though they so much resemble each other in treatment that it is evident that they were executed without trouble or very much consideration; while even the authemion with its accompanying scrolls, beautiful as it is, becomes a weariness when on an intelligible scale from the constant opposition and repetition of the forms composing it. S. S. G.

PICTURESQUE CITIES

AND

Monasteries of the North of Spain.

I. BARCELONA.

By F. HAMILTON JACKSON.

A LONG the whole sea front of Barcelona run the quays, as well as round the harbour by Barceloneta and on the other side of the port. Behind these quays is a fine promenade, planted with palms and other trees of considerable size, and with beds of flowers to enliven it with touches of colour, along which are scattered many seats to tempt the promenaders. It is called the Paseo de Colon or de las Acacias, according as you walk farther from or nearer to the sea, and commences under other names beyond the railway station for France, at the Park in which the Exhibition was held a few years ago, terminating in the Plaza de la Paz, from the centre of which the monument to Columbus rises—a lofty column surmounted by a figure which points out to sea with its raised right arm. From this point the Rambla turns off to the right, another broad street planted with shady trees down the centre, beneath which one may walk with comfort at any hour of the day, and with roadways at either side, along which tram lines run. It follows the line of the old walls, dividing the older city from the newer part. Under these trees the flower market is held, where for a few pence masses of beautiful flowers may be bought, while a little further on is the bird market, where parrots and song birds and all that they require when kept in captivity may be obtained. On arriving at the large Plaza de Cataluna, one may turn to the right, and passing down the Ronda de San Pedro to the railway station for Lérida, and again turning to the right towards the Park, the circuit of the older part of the town will have been made. Outside this line are very few things of archaeological interest. The hospital of Santa Cruz, and the two churches of San Pablo del Campo and S. Pedro de las Puellas—the Atarazanas, exhaust the list.

But there is a much narrower limit within which the oldest buildings of Barcelona are to be found—for it is said to have been founded by the Carthaginian Hamilcar, surnamed Barca, and thence called Barcino. The Punic city was small, and only occupied the hill Taber, just the site around the cathedral. Augustus Cæsar made it a colony, and called it "Faventia Julia Augusta Pia Barcino." There are very few Roman remains to be seen. In the Calle del Paradis are some columns built up in houses which are supposed to have been the termination of the aqueduct from Collcerola, of which an arch remains in the Calle de Capellans, and there are various fragments of sculpture scattered here and there. It was taken about 409 A.D. by the Gothi-Alani, and Ataulfo, the first king, chose it as his court, making it the capital of Hispano-Gotha. At this period money was coined there, with the legend "Barcinona," and two councils were held in the city, in 540 and 599. When the Moors, under Abdul-Aziz, destroyed Tarragona in 713, Barcelona capitulated, and became the metropolis, taking the place of that city. They did not retain it long, however, for Charlemagne and his son, Ludovic, expelled "the infidel" in 801, and then added the city which he had come to free to his Duchy of Aquitaine, of which it became the head. After this it was governed by counts, who in 874 became hereditary, when Charles the Bold made it an independent kingdom to reward Wilfred el Velloso, who had aided him against the Normans. This Wilfred—called "the Hairy," because he had hair even on the soles of his feet—is said to be responsible for the arms borne by the counts,

and which the city of Barcelona still bears—four bars Gules with a S. George's cross argent. He drew his blood-stained fingers across his shield after a battle with the Normans, and so blazoned his arms in true warrior fashion.

Ramon Berenguer IV. united Catalonia to Aragon by marriage with Petronilla, the heiress of the latter kingdom. Under him Barcelona was the rival of Genoa and Venice, and the emporium of Southern Europe. It was thronged with Provençal troubadours, and councillors and statesmen, who framed the laws of the "Consulado del Mar," a commercial code which dates from 1279, and was respected and imitated everywhere.

It was early a centre of learning, and one of the first cities in Spain in which printing was made use of, and at the present day some of the best Spanish publishers are to be found within it. Here also in 1543 a ship of 200 tons was launched, which moved by steam. The inventor was one Blasco de Garay, and the experiment took place in the presence of a committee named by Charles V. and Philip II. The King's treasurer, Rávago, was hostile, and drew up an unfavourable report, so the matter went no further, though the inventor had all his expenses paid and a present made to him of 200,000 maravedis. His secret died with him, but the memoir at Simancas on the subject seems to say that the trial was successful, though it is whispered that the paddles were moved by men and not by steam. Cervantes, who knew every town in Spain, describes the city enthusiastically as "the flower of the beautiful cities of the world, the honour of Spain, the jewel and delight of its inhabitants, and the satisfaction of all that a curious and discreet desire can ask a great, famous, rich and well-laid out city to be!" The climate is mild and equable—the heat in

summer rarely being greater than 87deg., or the thermometer in winter falling below 28deg. while the average of rainy days in the twelvemonth is but sixty-nine!

The cathedral is the most interesting structure in Barcelona, and to it the attention should first be directed. It is built on the site of a Pagan temple, and is the third church which has stood in this place, the first stone having been laid by Jaime the 2nd, in 1298. It is a typical example of the Ecclesiastical Architecture of Catalonia, which differs considerably from that of other parts of the country. Here are the flight of steps leading to the west front, the belfry towers, the lofty roof supported by slender piers, the fine painted glass; though the cimborio, the lantern usually placed over the crossing of the nave and transepts, is at the west end of the nave. Outside of the nave with its aisles are chapels between the flying buttresses, above which is a sort of gallery, the vaulting being at the height of the aisle vaults with the principal windows just below it. This arrangement produces a very fine effect both in the lighting of the church and in the cross views which one gets when looking from the crossing towards the aisles. The windows of the chapels look into chapels in the cloisters, thus telling as light spots from within and as dark piercings from without. Below the organs, and in other places also, are Saracen's heads, carved and painted in their natural colours—an eccentric ornament.

Here, in 1519, Charles V. celebrated an installation of the Order of the Golden Fleece, the only one ever held in Spain. The walls were hung with rich tapestries and velvets. On one side rose the vacant throne of Maximilian I., canopied with black velvet hangings. On the opposite side, on one of brocade, sat Charles V., then only King of Spain, and

FUENTE DEL OCA, CLOISTERS, BARCELONA.

around him were grouped Christian of Denmark, Sigismund of Poland, the Prince of Orange, the Dukes of Alba, of Frias, of Santa Cruz, and the flower of the nobility of Spain and Flanders. The arms of the Knights Companions, and of our Henry VIII. among them, are blazoned on the stalls, the canopies of the upper row of which were carved by two German sculptors in 1487. They are beautiful, but the chapter grumbled at them and refused to pay the full price agreed upon. The lower row was sculptured by Matias Bonafé in 1453. A curious clause occurs in the agreement between him and the chapter, by which the sculptor was forbidden to introduce images, figures, or beasts of any kind, and to limit himself to leaf ornamentation. There is an interesting staircase leading to the pulpit with a traceried handrail and open ironwork door. The trascoro is the work of Pedro Velar of Zaragoza, from the designs of Bartolomé Ordano. It consists of white marble reliefs of subjects from the life of S. Eulalia between Doric columns. The bishop's throne has a lofty canopy of excellent workmanship in the Gothic style. Under the high altar is an open crypt, the Chapel of S. Eulalia, the tutelary of Barcelona. It is raised on several steps in consequence, which approach from each side in a curved form, allowing the interior of the chapel with its rows of hanging lamps to be seen. This was the work of the Mallorquin Jaime Fabre in 1339, who had been directing the building of the Cathedral since 1317. His is the first recorded name of an architect to the chapter. The next is that of Maestro Roque in 1388, and the last mentioned is that of Escuder, in the middle of the fifteenth century. The cathedral was finished in 1448, and is dedicated to the Holy Cross and S. Eulalia, the latter name being added when the saint's body was brought to the church. Around the apse are chapels, arranged like those in the nave, and the windows are filled with excellent glass. San Olaguer lies buried here in his own chapel. He was a Frenchman, and died in 1137. His body was miraculously discovered about 500 years afterwards, "quite fragrant, and uncorrupted, save for the tip of his nose." He was made a saint by Innocent II. in 1675, and since then has been tutelary of the Catalans. His body may easily be seen, dressed in his robes, in the shrine behind the altar. Ramon Berenguer I. and his wife Almudis are buried near the sacristy. Their tombs were re-

stored in 1545. In a chapel behind the apse is a crucifix, called El Cristo de Lepanto. It was carried on the prow of the flagship in that battle, and turned aside to avoid the infidels' bullets, remaining so inclined to the present day.

The beautiful cloisters were begun by Roque in 1388, Gual succeeded him in 1432, and they were finished in 1448 under Escuder. In the centre is the usual garden with palm trees and other tropical plants growing in it, and with two fountains, one of which is surmounted by a little statuette of S. George on horseback fighting the dragon. The other is the fountain "de las Ocas" of the sacred geese, the remains of the canonical aviary. There are still four of them who waddle round the fountain and appear to have an easy life of it, for they disdain to eat bread. The door leading into the cloister through the chapel of S. Lucia is Byzantine, together with the little belfry, which contains the oldest bell in Barcelona. Close by the fountain of S. George is another beautiful entrance doorway with a pieta carved in the tympanum, through which a charming glimpse of the interior may be obtained, the fountain being backed by orange, palm, and other trees, above which appear the lofty arches of the arcade on the other

side of the cloister, an arcade of simple pointed arches without tracery, but enriched with panelling of quatre-foils on the soffit and other panelling on the shafts. Each bay contains a chapel on the other side of the ambulatory, except where the entrance doorways are on three sides, the western wall being plain. These chapels are all closed by rejas of iron, the earliest dating from the fourteenth century, which are the work of members of a guild of ironworkers. They are all excellent, though differing much in design and in the dexterity of the workmanship. Up and down these beautiful cloisters pace many couples in earnest converse—a priest, perhaps, with a poor woman who confides to him her troubles, and asks for advice; two lovers who meet under dangerous conditions, as their furtive glances here and there betray; or two girls who are telling their lesser secrets to each other; and there is a constant stream of people going and coming from a sacristy or baptistery in the corner, and a christening party every now and then, with much laughter and chattering and fluttering of gay ribbons.

There are some curious sculptured effigies of tailors with their shears, and bootmakers with their boots. The guild of the latter—"El Gremio de los Zapateros"—was a benefactor to the cathedral in 1208. Their *casa* covered with symbols, and with a statue of their patron S. Marcos (whom the Catalans preferred to S. Crispin), is quite close to the cathedral steps, while to the right is the canon's almonry. The bishop's palace is to the south of the cloister, and has a few remains of Romanesque arcading.

A little below the cathedral on the other side is a quaint little plaza—the Plaza del Rey—at the end of which is the old palace of the Kings of Aragon and the desecrated Chapel of S. Agueda, which belonged to it, in which the Order of Montesa was instituted on the 19th of July, 1319. The palace dates from the twelfth century, the chapel from the end of the thirteenth. The latter is now used for the Archaeological Museum, and contains an interesting collection of fragments of architectural sculpture, sarcophagi, &c., and a few ancient paintings. The palace was given by Ferdinand to the Inquisition in 1487, just as he made over the royal residence at Zaragoza in the hope that royal associations might induce obedience to the new tribunal, which he intended to be an engine of police and finance. It became afterwards the palace of the Viceroy, then a convent, and afterwards a prison. The archives of Aragon occupy a portion of this building. The municipal archives are the finest in Spain, exceeding 8000 volumes, and commencing with the year 874. Returning by the Bajada S. Clara to the Calle Freneria the ironwork crowning the lofty bell towers of the fourteenth century becomes visible. The bells are hung in a very graceful cage of ironwork fixed on top of the masonry. The great bell was cast in 1393.

(To be continued.)

PLANS by Mr. W. H. Thorp, architect, for the extension and reconstruction of the Lord Mayor's Rooms, at the Leeds Town Hall, have been approved. The proposed structural alterations will cost about £7000.

PLANS have been laid before the Markets Committee of the Leeds Corporation for the carrying out of a further improvement at Kirkgate Market. The large area set apart for market gardeners has recently been covered in, and it is now proposed to extend the roof to Harper Street. The scheme will involve the demolition of the existing retail fish market, but other accommodation will be provided for the displaced salesmen. The estimated cost of the whole improvement is £10,400, including roofing, boundary walls, shops, and stalls.

BAJADA, S. CLARA, BARCELONA.

NEW GOVERNMENT BUILDINGS.

THE SCHEME BEFORE PARLIAMENT.

THE new Government offices scheme was before Parliament at last Thursday's sitting. The First Commissioner of Works explained the details, and, on a division, the House, by a majority of 250, carried a resolution authorising a Bill for the issue out of the Consolidated Fund of sums not exceeding £2,550,000 "to provide for the purchase of land, buildings, and the construction of works and buildings in connection with certain public departments."

The House went into committee on a resolution dealing with expenses for new public buildings in London, Mr. J. W. Lowther (Cumberland, Penrith) in the chair.

Mr. AKERS-DOUGLAS (Kent, St. Augustine's) said that for half a century schemes had been constantly put forward for re-housing certain public departments for which up to the present accommodation had been provided only as necessity arose—a method extremely inconvenient and expensive. Committees of the House had sat and reported, always adversely to the existing practice, and always in favour of providing proper and permanent accommodation in place of those unsatisfactory and temporary premises. The method at present in use was contrary to good administration, contrary to proper control, and contrary to economy. He could not give the committee a better illustration of the inconvenience of the existing system than the present condition and situation of the War Office buildings. The War Office buildings were never designed for use by a public department. They were

A COLLECTION OF OLD HOUSES,

scattered over a large area. Many of them were ill-adapted for their purpose, were not too healthy, and certainly not too well ventilated. The War Office was located in something like eleven different houses, which were situated all over this portion of London. The Board of Trade was housed likewise in eight or nine different buildings. The Home Office, the Local Government Board, and the Education Department were similarly situated. Under such circumstances how could they expect good administration or proper control? With regard to the question of economy, while they were hiring these temporary buildings they were allowing large plots of land, most suitable and convenient for the erection of public buildings, to lie idle. It appeared from the evidence before the Select Committee of 1896 that while the country was paying not less than £16,000 for temporary office accommodation, quite irrespective and in addition to the premises on Crown lands, from which it would be released if this scheme were carried, it was allowing land of a larger rental to remain derelict. The rental of the unused land in Whitehall, on which Carrington House formerly stood, and the adjoining wilderness, had been estimated at £10,000 a year, while the vacant land in Charles Street, acquired so long ago as 1866, was in 1892 valued at £130,000. For thirty years, therefore, this land had practically earned no interest. But the loss to the country was not represented solely by the cost of those

TEMPORARY BUILDINGS.

Large sums of money had been sunk in the shaping of temporary premises and leasehold premises to the requirements of offices, whilst the multiplication of caretakers, office-keepers, and the general staffs, tending, of course, to increase the annual estimates, had been the inevitable result of this lack of concentration. The Government had determined to put an end to this state of things, and since they had taken office they had steadily worked up to that end. In 1895 they carried a measure authorising the expenditure of £145,000 for the purchase of the Parliament Street site. In 1896 they obtained another Bill for the compulsory purchase of that site. In the

same year a strong committee was appointed to inquire into and report on the manner in which sites available for Government buildings might properly be utilised for that purpose. In 1897 a Bill was carried authorising the expenditure of £15,000, in accordance with the recommendation of the Select Committee, for the purchase of

THE CARRINGTON HOUSE SITE,

for the erection of the War Office. The committee, which was again reappointed last year, concluded their labours by a further report, in which they recommended the appropriation of the Parliament Street site for the Board of Trade, the Education Department, and the extension of the Local Government Board.

bad weather might stop the work: the money voted the year before might not in consequence be all spent; the balance had to be handed back to the Treasury, and the money had to be re-voted in the course of the next year. Proceeding by Bill also enabled the Government to settle definitely the adoption of a scheme, and to remove it from the dangers of a change of policy, which had been so fatal to the building proposals of the Government in the past. The Government asked first for a sum of £475,000 for the building of the War Office. The Carrington House site was amply large enough for that purpose. It contained an area of 75,000 square feet, which was more than what was asked for by the authorities of the War Office, and which would therefore

PUERTA DE LA PIETA, CLOISTERS, BARCELONA.

The Government had now acquired, or at all events had power to acquire, the whole of the sites recommended by the committee as necessary for the requirements of those departments, and they now asked Parliament to find them the necessary money to proceed with the buildings. The method they proposed to adopt was to proceed by Bill to provide the necessary expenses out of the Consolidated Fund. The advantage of proceeding by Bill rather than by annual estimates was obvious. In all matters connected with buildings it was unwise and certainly uneconomical to proceed haphazard. A recognised scheme ought to be settled, and the work ought steadily to be proceeded with. This course was often difficult if they proceeded in the ordinary way by voting certain sums every year in the annual estimates. The money available one year might not be forthcoming the next. A bad frost or

allow for any further expansion that might be required. The Government further asked for a sum of £600,000 for the erection of the buildings on the Parliament Street site, and another £100,000 for the completion of the purchase of that site. The scheme carried with it the very necessary widening of Parliament Street. The Government also proposed to place in the Bill the money which was still required for the

COMPLETION OF THE ADMIRALTY BUILDING.

As it now stood, £125,000 were wanted to complete the building according to the original plan and estimates; but owing to the very large increase in the Navy within recent years it was necessary to provide for the corresponding increase of the staff at the Admiralty. The Government therefore asked in addition for £150,000 to provide for that extension. They already possessed the neces-

sary site upon which the extension should be placed, and consequently they asked for nothing under that head. They further asked for £300,000 for additional post office buildings. It was proposed to obtain for the accommodation of the post office the building which was now occupied by the Savings Bank Department in Queen Victoria Street. That building was barely large enough for the present work of that department, and was quite unequal to the expansion which would shortly be required. It was unnecessary, in the opinion of the Government, to find accommodation for so large a department as that in the City, where land was very high in price; and they thought the building should be placed further from the centre of London. A site had been obtained at West Kensington; and they proposed on that site to erect a building for the Savings Bank Department. The Post Office would take over the building in Queen Victoria Street, which was near the Central Post Office, and well adapted to the work, and which would enable the Post Office to house in a more convenient manner and with less expense certain departments which were now accommodated

IN UNSATISFACTORY TEMPORARY PREMISES.

Lastly, the Government asked for the large sum of £800,000 for the completion of the buildings at South Kensington in connection with Science and Art. He was quite certain that the committee would admit that the settlement of this question had been demanded both by the House and by the public for many years past. In 1891 the decision was come to to proceed with the building to complete the accommodation for the Art Museum, and for housing the administrative departments of Science and Art. Plans were accordingly prepared by Mr. Aston Webb, and accepted, for a building to occupy the land on the south side of the Museum facing the Cromwell Road; but the resources at the disposal of Chancellors of the Exchequer, on both sides of the House, unfortunately did not permit of the grant of the necessary funds, and the scheme had since then been in abeyance. Since that scheme was formulated, and partly in consequence of the report of the Commission on Secondary Education, it was in contemplation to move to the Education Office the secretariat of the Science and Art Department, and further—in accordance with the recommendation of the Select Committee of last year on the South Kensington Museum—it was decided to remove the official residences and certain other temporary buildings, which was a source of danger from fire. With this additional space at disposal, it would now be possible to provide on the eastern side of Exhibition Road the necessary accommodation for both Science and Art. It was therefore intended to build, in addition to the building proposed in 1891, further buildings which would complete the frontage on the Cromwell Road and Exhibition Road sides; and, in the opinion of the Government, that would amply meet the requirements of both branches for many years to come. These items brought up the total to £2,550,000. He should also mention that there would ultimately be a very considerable set-off to this sum by the lease and disposal of the War Office buildings and sites in Pall-mall and those of the Board of Trade in Whitehall. Their estimated value, together with the capitalisation of the rent now paid for temporary offices, would amount to over £1,000,000. The Government did not maintain that this was a final or complete scheme for

HOUSING THE WHOLE OF THE GOVERNMENT DEPARTMENTS;

but they believed that it met all the present needs of the service. The Government earnestly recommended the scheme to the committee, in the conviction that it would materially facilitate the administration of the public service, greatly improve the approaches to Parliament, and add very largely to the architectural beauty of London. He concluded by moving the financial resolution embodying the Government's proposals for the expenditure of a sum of £2,550,000.

Mr. LABOUCHERE (Northampton) said that it was too often the case, in respect to Govern-

ment buildings, that the architect thought only of the beautiful outside, without regard to the needs of the departments to be housed and the accommodation they required inside. The Office of Works had officials who thoroughly understood what were the interior requirements, and the building of these new offices should be undertaken by the department itself.

Mr. JAMES LOWTHER (Kent, Thanet) wanted to know whether all the ground from Parliament Street to St. James's Park was to be included in the Parliament Street site, or whether a strip was to be left, which would probably have to be acquired at a later date and at a greatly enhanced cost? He also asked whether the Government had considered what a profitable bargain for the country would be effected if the very valuable site of the Post Office buildings at St. Martin's-le-Grand were sold and the Post Office headquarters were established elsewhere.

Mr. DILLON (Mayo, E.) said that the Nationalist members, who were strongly opposed to the enormous sums being voted for the Army and the Navy, were also opposed

CLAY MODEL FROM THE CAST.
ARTS AND CRAFTS SCHOOL, REGENT STREET.

to this increased expenditure on the War Office. While Ireland was claiming a readjustment of the financial relations between herself and Great Britain, it was adding insult to injury to increase the national expenditure by leaps and bounds without attempting to meet

IRELAND'S CLAIM

in any reasonable spirit. England was, no doubt, rioting in the unparalleled abundance of her prosperity, but in Ireland the people were starving, and Irish members resented every increase of expenditure which brought no benefit to Ireland as an outrage on the Irish people. English Radicals seem to have forgotten the traditions of their party. There was a time when no increase of expenditure, especially on armaments, could be made without arousing the opposition of some influential Radical. Now English Radicals were voting nearly half a million for the War Office without having any assurance that there would be an improvement in the administration of the War Office, though repeatedly great authorities had written to the Times pointing out that the waste, inefficiency, and overmanning

of the War Office were a scandal. He was also opposed to the further extension of the Admiralty buildings. He should divide against the resolution.

Sir W. HARCOURT (Monmouth, W.).—I do not agree with the hon. member for East Mayo in his view of economy, nor do I think that question really arises, because when we have determined upon an expenditure for the Army and Navy it is certainly a distinct question whether or not those services should be properly provided with the places in which they are to be administered. That a good deal needs to be done in order to facilitate the administration of the various departments in the State is a thing which anyone acquainted with the matter will readily admit. I think the right hon. gentleman the First Commissioner of Works did rather scant justice to his predecessor in assuming that this was for the first time discovered in 1895, because in the late Administration we had already begun the plans for providing public buildings, and especially doing that work with reference to South Kensington. I only put in that claim. No doubt this is a much larger and more

EXPENSIVE PROPOSAL

than that which we contemplated. I only rise for the purpose of pointing out that this is only the preliminary and necessary financial resolution. Of course, the matter in general and in detail will have to be dealt with in a Bill. Upon the Bill it will be open to us to discuss the propriety of each scheme and the amount to be given to it. I confess some of the sums seemed to me portentous. I think the expenditure of £800,000 on South Kensington is startling. It is double the amount to be spent on the War Office. The right hon. gentleman said he thought these public buildings would not only redound to the advantage of the Administration, but also add to the decoration of the metropolis. I wish I had that confidence. I cannot say that has been the experience of public buildings put up during the last half century. They remind me of the lines of Byron in which it was asserted of certain poetry that "The most recent is the least decent," and I say that each public building in succession seems to me to be

WORSE THAN THE LAST.

There is one thing I hope the right hon. gentleman will bear in mind, a condition which has been totally overlooked in the past, that the building of these public offices should have some reference to the uses to which they are to be put. That is a thing which I can testify has been totally neglected in the great block of buildings which include the Home Office, where I was myself for some years, the Foreign Office, and the Colonial Office. It is impossible to conceive places less adapted for the purposes for which they were intended. I am glad to hear that the modern Admiralty in that respect at all events, is an improvement; and that there are rooms there fitted for the purposes of those who occupy them. Even on a midsummer day, you cannot get from Whitehall into the Foreign Office except through a passage lighted by gas. I do not know that I should regard the police building erected by Westminster Bridge as a decoration of the metropolis. It is rather inferior, in my opinion, to Messrs. Crosse and Blackwell's establishment which faces it on the other side of the water. If we are going to spend two and a half millions of money, or anything like that sum, on modern buildings we should proceed upon some different plan from that which has been adopted in the past, and which has evidently been extremely unsatisfactory. I should like to hear that though the Government take these large sums in the resolution they are not bound by the whole amount.

THE CHANCELLOR OF "THE EXCHEQUER": Oh, no.

Sir W. HARCOURT: There will be every opportunity to discuss all the various items in the Bill, and so far as the resolution merely asserts that a sum of money ought to be economically expended in providing further buildings for public offices, I shall certainly support it.

Mr. J. BURNS (Battersea), as a member of the

two Select Committees which had inquired into Government buildings, said he should support the resolution moved by the First Commissioner of Works. It was not necessary for any member to identify himself with the edification of Tommy Atkins and the military spirit in supporting the motion; neither was it necessary to associate himself with any views as to the financial relations of England and Ireland. He shared the hon. member's views, and yet he supported the resolution. If they wanted to reform the War Office the best way was to bring the officials into

A DECENT BUILDING,

where they would be subjected to the public gaze, and where they should no longer find talent hidden and incompetence obscured. He trusted that in all these new offices the First Commissioner would stipulate that no official residences should be incorporated therein. Any competent chief of a fire brigade would condemn official residences in public buildings as a source of danger. In South Kensington, when the department was crying for increased accommodation, the committee found there were 102 rooms occupied by officials who had absolutely no right to claim house accommodation on that particular spot. He rejoiced that the First Commissioner had the courage to root out those officials stock, lock, and barrel. The outlay of £800,000 for South Kensington Museum seemed to be a large amount for the completion of the buildings, but every foreigner who had seen those buildings commented with surprise on the way in which the valuable collection of treasures was housed there. Looking at the museum from the main road, it struck the onlooker as a cross between a tramway stable and a goods yard. He hoped that the Government would press forward with the completion of the scheme as soon as possible. Before the plans were finally settled he hoped that they would be exhibited in the tea room of the House. He also suggested that a small committee of members familiar with official and municipal administration, conjoined with one or two officials like Sir John Taylor, should be formed to examine those plans.

IN THE LIGHT OF THE CRITICISM

which had now been offered.

Sir H. CAMPBELL-BANNERMAN (Stirling Burghs) said he wished to relate a circumstance within his own knowledge which tended to confirm the view taken by the Government of the necessity of this scheme, while it also supported the criticisms made by his right hon. friend as to the character of some of our recent buildings. In 1874 there was a change of Government, and Lord Cranbrook (then Mr. Gathorne Hardy) was appointed Secretary of State for War. The first thing which Lord Cranbrook did was to go over the office, to the head of which he had been appointed. He was shocked and horrified by the condition of the place, and at the idea that gentlemen should be invited to serve the country in such wretched places as were provided for them. Lord Cranbrook brought the matter before his colleagues. At that moment the large block of buildings now occupied by the Home Office and the Local Government Board had just been completed, and Lord Cranbrook told his colleagues that he would not be responsible for keeping his clerks in such a place as the War Office while this other building was available in which they could be housed, and he added, "I claim the first right to the new building for the officials of the War Office." This claim was agreed to by the Government of the day, but the heads of the War Department, after inspecting the new building, came and said, "Sir, for heaven's sake let us stay where we are, for, bad as our building is, and founded as it is mainly on disused cesspools, and constructed after

THE MODEL OF A RABBIT WARREN,

we prefer it to the ghastly and ghostly uncomfortable, dark, draughty, incommensurable, and inconvenient building which you have been good enough to offer us." That was twenty-four years ago, but the inconvenience had remained. It was a scandal, and it was high time that a new War Office was erected.

This was the opinion formed by experienced public servants of the degree of convenience provided by the most modern building then erected. He agreed with what his right hon. friend said when he declared that they did not want these dark corridors and enormous rooms. The dignity and comfort of a room did not depend on its size, but on its proportion; and nothing was more injurious to the despatch of public business than that public servants should be obliged to work in such places as some of our more modern buildings were found to be.

Mr. COURTNEY (Cornwall, Bodmin), in referring to the removal of the Post Office Savings Bank in Queen Victoria Street, confessed that he had often thought of the terrible waste which was involved in the maintenance of that building. On the main proposal of the First Commissioner of Works, and the withdrawal of £2,500,000 as a surplus which might be applied to the reduction of the National Debt, he thought that greater attention should be given to the machinery for the redemption of the National Debt, and that the committee should not pass the surplus which was to be appropriated under this scheme without some compensating provision being established contemporaneously for the raising within a limited number of years of an annual sum which would repay what was otherwise lost for the purpose of debt redemption.

Mr. T. P. O'CONNOR (Liverpool, Scotland) joined his hon. friend the member for East Mayo in protesting against Ireland being called upon to bear a financial burden in excess of her proper share under the scheme proposed by the Government.

Mr. AKERS-DOUGLAS, in replying to the criticisms offered, acknowledged that he had made an omission in not paying a tribute to the assistance which had been rendered in furtherance of the scheme by his predecessor in office. He shared the opinion of the leader of the Opposition that many of the

PUBLIC BUILDINGS RAISED IN RECENT YEARS

had not given that amount of accommodation which was needed and felt to be necessary. He hoped, however, that the committee would not press him at that time to enter upon points of detail, inasmuch as there would be future opportunities to consider the Bill in Committee. As to the appointment of architects, he said that it was not the intention of the Government to go to public competition on this subject, because he thought it was generally admitted that public competition had failed in the past. He believed that by adopting the policy of themselves, through Sir John Taylor, who would act as their assessor, seeing that the interior of the offices was such as would meet the requirements of the case, and, then, appointing an architect for the purpose of clothing the building, the Government would be most likely to get offices which would meet the requirements of the public service and give a certain amount of comfort to those who were compelled to work in them. He assured the committee that he and his department would use their best endeavours to see that proper accommodation was afforded in the offices and that the buildings had a fit and proper elevation and one in keeping with the surroundings. The right hon. gentleman the member for Thanet had asked what would be the extent of the site. The new Parliament Street would be in alignment, more or less, with the existing Home Office. He said more or less because it might be necessary for architectural purposes to have some going back from the parallel line with the Home Office. It would be bounded on other sides by the buildings of the Institute of Civil Engineers, by Charles Street and Delahay Street. Personally, he would like to have acquired Delahay Street and Charles Street, but he doubted whether the committee would have been in the same frame of mind they were in now if he had asked them for another million of money which that would have cost. They had not thought it right to ask for a larger sum of money than would provide those buildings which, in the interests of the public service, were absolutely necessary. It was the intention of the Government

to remove the official residence at South Kensington. He entirely agreed with the hon. member for Battersea that there should be no official residences in these new public offices, because he held very strongly that an office was very much safer in the charge of a night watchman and fireman than it possibly could be in the charge of an office-keeper who lived in the house and had open grates and other means of creating conflagration. His right hon. friend the member for Thanet also asked whether they had considered the possibility of getting rid of St. Martin's-le-Grand. The Government had not taken that matter into consideration, but they had gone some way to meet the views of his right hon. friend by deciding that the extension of the Savings Bank should be built at South Kensington, where land could be obtained at a cheap price, rather than in the City, where they would have to pay through the nose for land.

Mr. WARNER (Stafford, Litchfield) asked whether the scheme included the carrying through of the Mall into Whitehall?

Sir W. HARCOURT said it had been suggested by one hon. member that the million which would be received for the spaces which would be available when the new offices were built would be deducted from the £2,500,000. Was that so? Would the ultimate charge be £2,500,000, or would it be less by £1,000,000?

Mr. AKERS-DOUGLAS: Less by a million sterling.

Mr. A. H. A. MORTON (Deptford) inquired whether it was contemplated that the design should be such as to enable the possibility of future extension?

Mr. AKERS-DOUGLAS said it was intended that the design should be capable of extension hereafter. The scheme did not include the extension of the Mall, but the Government had decided to open the Mall into Whitehall. They could not do so yet, as the buildings standing there now were in use by the Admiralty.

The Committee then divided, when the numbers were:—

For the resolution... .. 265

Against it 15

Majority —250

The House having resumed, the resolution was reported to it.—*The Times*.

ARCHITECTURE AT THIS YEAR'S ACADEMY. NOTICE.

The Editors of "The Builders' Journal" and of "The Architectural Review" respectively, have arranged for a large number of Drawings to be reproduced in one or other of these Publications, of work to be submitted to this year's Academy. They have also arranged, for the convenience of Provincial contributors to the Academy, to act as Agents for the forwarding of Drawings to Burlington House. Should any further Architects in the Provinces desire us to act in this manner, we should be glad to have their instructions by return of post, together with the originals to be forwarded.

THE old home of the Manchester Committee of the Independent Theatre, the Gentlemen's Concert Hall, is about to be pulled down.

THE Belfast Corporation has decided to establish and equip a technical school at a cost of about £30,000, on the site of St. Anne's Market, belonging to the Corporation.

HERALDIC DRAWING AND ITS ADAPTATION.

By J. D. CRACE.

IN a paper on the above subject, read before the R.I.B.A. on Monday night, Mr. J. D. Crace said that, in the drawing of heraldic devices, one leading principle applied—the necessity of recognising what has to be said, and how to say it simply and directly. The heraldic device was intended to appeal, not to the sensibilities or emotions, but to a simple intelligence, to be rapidly understood. The eagles, lions, roses, or fleur-de-lys of heraldry were not to be thought of as pictorial illustrations of the animal or vegetable creation, but as symbols. The conventional or symbolic representation of the heraldic “charge” conveyed certain limited information at a glance. Heraldry had been described as “out of date,” “antiquated nonsense,” but modern equivalents for the heraldic “ordinaries” might easily be found. The effigies painted on tavern signboards showed at once the name and purpose of the house; the colours of the jockey’s jacket conveyed distinct information; flags, whether for signalling or for distinction, were heraldic. The lecturer cited instances of the ease with which facts about people dead centuries ago could be learned from

THE HERALDRY DISPLAYED ON RELICS

associated with them which had come down to the present day. In decorative heraldry, whether architectural or otherwise, extreme clearness of expression is required; the more so as frequently the examples are distant from the eye, or in positions where other forms more important to the composition must be so rendered as to claim the first attention. The details have also sometimes to conform to cramped and difficult spaces. Allusion was made by the lecturer to the close relationship between the symbolic design of heraldic charges and the less direct forms used in expressing ideas by writing. Looking back to the remote times of Egyptian Art, each of the kings and queens of the various dynasties could be distinguished by the “cartouche” bearing the symbols of that sovereign. That “cartouche,” repeated on the cornice of a temple, was almost as heraldic as the shield repeated on the cresting of an English monument, and its object was virtually identical. The animal devices used as symbols on Egyptian monuments of 3000 years ago had never been surpassed, and should be well studied by the heraldic draughtsman. Though used to convey the sense of words or sounds, they were also used to convey certain information even when writing came into general use. For monumental purposes the well-recognised symbol conveyed the idea more promptly. It is of primary importance that the object representing the idea should be so drawn as to be promptly recognised; and

THE ART OF CONVENTIONALISM

is the art of selecting the most characteristic points, leaving details to be filled in or not according to circumstances. Having shown under what conditions it was permissible to multiply or omit details, and when “naturalism” or fanciful treatment might be indulged in, provided the object represented was as far as possible unmistakable, the lecturer went on to speak of heraldic draughtsmen of the last fifty years who had successfully grasped the problem of sound conventional drawing as applied to heraldry, selecting for mention the names of those deceased—Willement, Pugin, John Powell, James West, Clement Heaton, and William Burges, all in their several ways real artists. So far as heraldic Art was concerned, Pugin was *facile princeps*. In point of design and arrangement his heraldic glass at Westminster was without equal. The lecturer then dealt with the relations between the helm, the crest, the wreath or torse, and the mantling, describing and explaining the origin and purpose of the various parts, and some methods of treatment. Touching heraldry abroad, the Germans had always maintained a love for

heraldic device; and the principal front of the new Parliament House in Berlin is ornamented with two fine heraldic panels, in which the shields are combined with sculpture of very high artistic merit. In Spain heraldry was freely used for the decoration of Architecture—there were notable examples at Burgos and Toledo. Magnificent cloths of state, embroidered with the arms and badges in gold and colour on silk or velvet grounds, were also in use in Spain. Such decorations, the lecturer considered, might be introduced into municipal and other public ceremonials in our own days.

A REALLY FINE HERALDIC CLOTH

would make a much more imposing background to a royal or municipal group than the extemporaneous and tawdry finery ordinarily the expedient on such occasions, and the cost, in the long run, would be less than what is now expended spasmodically on temporary rubbish. As examples of the valuable decorative effect of heraldry in Architecture, the lecturer instanced the blazoned shield in the boss at the intersections of rib-vaulting, or on the hammer-beam of a timber roof, or in some of the high chimney-pieces illustrated in Mr. Gotch’s paper. Having summed up the essentials necessary to good heraldic designing, the lecturer, in conclusion, read some notes furnished for the paper by Mr. George W. Eve, author of the recently published work on “Decorative Heraldry.” These notes touched upon the influence of Architecture on heraldic designs in book-plates, perceptible from the very earliest examples; the value of the panel as a basis of design, as shown in the works of Sebald Behem, Virgil Solis, and others; the extensive use of architectural details in the armorial work of Albert Dürer and his school, and in the elaborate compositions of Jost Amman; and the modifications in treatment the armorials have undergone by the influence of the sculptures and coats-of-arms represented in high relief.—The paper was illustrated with several designs, including the original drawings by Pugin for the heraldic glass in the Houses of Parliament—Mr. J. A. Gotch, proposing a vote of thanks to the lecturer, said of late years there had been a considerably

INCREASED DESIRE FOR HERALDRY.

and therefore it was most desirable that architects should be in a position to draw heraldry well. To his mind, the interest in heraldry did not consist—as it did to some—in a multiplicity of quartering. That appeared to be a vain desire for self-glorification; but it consisted rather in a beautiful rendering of the simplest forms of animal art, so that they did not get unintelligible decoration, but a design which was suitable to the place it occupied, and which was easily read at a distance. Of course they were now, as they always had been, very largely in the hands of the officials of this particular form of Art, the Heralds College of Arms, and it was a great satisfaction to notice the greatly improved methods which were being followed in that institution. Some ninety years ago the kind of arms which they granted were absolutely impossible of decorative interpretation, but he was glad to know that many of the officials there had a great desire, not only for better forms, but also the ability to present them, and in the course of time he imagined, when the control of these things evolved and developed—because, of course, those in high places should actually give a final decision in the matter—they might hope for greater improvements. There was

ONE QUALITY IN HERALDRY WHICH WAS NECESSARY,

and that was vigour, because the whole of heraldic living creatures belonged to the male sex. They never saw a lioness, for instance; they always saw the lion. He thought the only female animal—if it could be called an animal—represented in heraldry was the mermaid. There was another branch of heraldry which was also important, and that was how to impart beauty and interest to commonplace objects. They might say it was comparatively easy to draw an interesting lion, or an inte-

resting pig—they would find one of the designs by Pugin was a pig of the most interesting kind. But when they had to draw a porridge-pot or a wheel, the thing was not quite so easy. As an illustration there was exhibited a Spanish cloth with a wheel which was represented in the perspective, and in a very simple, striking, and graceful manner. It was an important point to remember that in mantling there were always two sides of different colours.

IN REFERENCE TO BOOK PLATES,

there had been a vast number of designs in recent years, but he thought there was a great tendency rather to sacrifice the first object of a book plate for the secondary one of making it beautiful. It seemed to him the first object was that the name of the owner should be at once legible, but in many book plates the name had been the last thing they were able to ascertain. A man’s occupation or favourite hobby was portrayed—things interesting to himself, but not to the world at large—but his name was found in some obscure corner. That seemed to be departing from the heraldic spirit necessary in book-plates. Mr. Crace had struck a right note upon heraldic design, and if they followed his advice they would be able to design heraldry which should be quite distinct—not a copy of the Mediaeval—and yet conveying as much vigour and interest as any that had gone before it. That could only be done by getting thoroughly familiar, not only with the elementary laws of heraldry, but also with the anatomical forms of animals and objects which had to be portrayed.—Mr. St. John Hope, seconding, expressed a desire that on some future occasion Mr. Crace would deal with

THE SUBJECT OF BADGES,

and their treatment. In a great many old wills, inventories, and other documents, he had been struck with the very full way in which badges were used for decoration; and also with the comfortable way in which the badge had been employed on church vestments, altar cloths, hangings, and in every possible place, even in domestic work—in very great hall hangings, on paviers, floors, carvings, wainscoting, roofs, glass, and everywhere else. Pugin was one of the men who in recent years realised their value.—Mr. W. A. Lindsay defended the College of Arms, observing, in reply to the lecturer and Mr. Gotch, that, whilst he agreed as to the absurdity of some of the Crown arms of the last century, whatever fault there was in the college work, it was probably in assenting to what the public asked for rather than in presenting anything to the public. Personally he had been asked to execute certain coats of arms, but had endeavoured to refuse, though it was not always possible when dealing with a public body, and therefore the officials were not always to blame for.

EXCEEDINGLY UGLY DESIGNS.

He hoped the subject of heraldry would receive greater attention. He demurred from the suggestion that the name of the owner of a book should be prominent on the plate. If a book-plate meant anything at all, it was to tell the name of the owner without printing it in letters.—Mr. Wm. White said he supposed that heraldry on a book-plate was intended rather to transmit what was really the owner’s name, but written in heraldry instead of letters. From old shields they received the traditions of the names without any name being attached. As far as he could understand, it was quite a modern invention to introduce the name. The difficulty of ill-representation of heraldic device and its principles was caused by the absurd neglect of the skill of heraldry, as it was a little while ago in reference to the skill of Architecture. The only way to revive it was to have some popular lectures and explanations so that people might understand what was true heraldry.—The President remarked that heraldry was one of the most becoming subjects that could be treated in the Institute or by any society of architects.—Mr. Crace briefly acknowledged the vote of thanks.

Scottish Church Architecture

OF THE

XIV. AND XV. CENTURIES*.

BY HIPPOLYTE J. BLANC.

(Continued from page 112.)

AS formerly noted, while the Scottish churches of this period are designed to have nave, choir, and transepts, in many cases the nave has never been erected. A feature almost confined to Scotland at this time is the polygonal termination of the choir. It is to France, where it was very common, we must look for the prototype, for in English work it is not found in the Late period, though Wells Cathedral possesses it. Of that form we have many examples, some showing externally merely a continuation of the main roof; others projected from the terminal gable of the choir as a bow window. Of side chapels there are several, but they are either formed as quasi-transepts, or, as at Melrose, out of duplicating the south aisle of the nave, as at Coutances. Elgin appears to have had chapels similarly constructed. Other features, such as sacristies and porches, are noticeable in the work of this period—two of the porches, namely, at Linlithgow and Aberdeen, are quite unique for the possession of an upper priest's chamber or parvise with a turret stair conveniently placed to reach them. In doors of this period we have examples of features of nearly all the preceding styles. But it is noticeable that the round arched form is found most frequently through all the periods of Scotch Gothic. In detail of moulding it nevertheless usually conforms to that of the style of the building to which it is attached. Of double or twin doors of the period, we have interesting examples at Haddington and also at Linlithgow, both of totally different character, and seemingly of different dates. Upon this question of dates, however, it is very difficult sometimes to trace the period of execution of the several parts from their mixed character. Defined as are the early periods, it cannot be said that the later are equally so. There is no line of demarcation marking the change from the Decorated to the Third Pointed in Scotland, such as one finds between the Decorative and the Perpendicular in England; the movement is so gradual in Scotland. In external detail

THE SCOTCH DECORATIVE PERIOD

follows largely the suggestions of both England and France. Mouldings are, however, broader in treatment, and carving not generally so fine. There are many exceptions, however, and very often one comes across an interesting monument or sedilia, designed and carved with such richness as to be suggestive of French influence of later date. Of such we have excellent examples in Bishop Kennedy's tomb at St. Andrews and elsewhere. The towers of the period are very interesting, though perhaps not elegant. Placed at the crossing of nave and choir, or at the west end, they are usually sturdy features expressing a great variety of form and finish. They are rarely at this period extended as spires, though the two at Aberdeen Cathedral have spires in rather stunted form. The most interesting form of termination of towers we possess is the crown, as at Aberdeen College and St. Giles's, Edinburgh. Two others existed on a less scale, but were thoughtlessly recommended to be taken down through an unwarrantable fear of their giving way. One was St. Michael's Church, Linlithgow, and the other at Haddington Abbey. The origin of that feature has not been traced, I believe, but one English example, somewhat more elegant than our Scotch examples, exists at Newcastle. It is in the windows, however, that we find the most instructive expression of this period. There are many examples of pure Decorated work at the beginning, but as the fifteenth century progressed, the influence of the French Flamboyant manifests itself a little. The tracery, however, is heavy, often clumsy, and in many

characteristic examples the cusped foliations are wanting. Forms are likewise traceable to English examples of a much earlier period. Instances of geometric design are found at Melrose, Dunkeld, Paisley, Tain, Crossraguel, and Torphichen, and the reticulated pattern is found at Dunfermline Refectory. There are few of the English Third Pointed or Perpendicular type. Melrose, perhaps, bears the nearest approach to it, while in a less degree are other examples at Stirling, Linlithgow, and Corstorphine. At Melrose the south transept window, with its gable, shows a successful, and almost unique, example of the combination of Perpendicular, Flamboyant, and Decorated types.

OF CARVED WOODWORK

we have, unfortunately, very little left us of the period. An easy prey to fire, it is scarcely to be expected that much would escape in the track of the wars of the fourteenth century. At Dunblane, however, we still possess a portion of the stalls, which is traced to be of late fifteenth century or early sixteenth century work, and at Aberdeen and Tain respectively we have very characteristic pieces in a group of stalls and screen, and in a pulpit. Such then is a sketch of the outstanding distinctive features of Scotland's Church Architecture after the close of the thirteenth century—a sketch which it has been thought well should comprise the gradually diminishing few churches erected in the early part of the sixteenth century, prior to the Reformation. The last of these—a Collegiate church—was founded in 1545, and was scarcely finished when the Reformation became a completed act to turn the tide of church building into new channels. I trust I may be permitted to anticipate that you will, as I have done, recognise that in all works, Scotland has sustained

THE RACIAL CHARACTERISTIC OF STURDY INDEPENDENCE,

though expressed sometimes at the expense of elegance. The English work of the same type, busy with many small members in mouldings, attenuated arcades supported on elegant but rather reduced shafts, does not seem to have appealed to the Scottish mind. The Scotch seem to have preferred the strength and solidity of their earlier works, continuing the cylindrical and polygonal shafts in arcades, even to a very late period; and in nearly every case they exhibit a mastery of the Art of masonry construction quite commendable. It must be recognised that Scotland laboured under very special disadvantages from its prolonged internal disturbances. These severed her continuity of Art study and culture, yet her work bears the impress of a vigorous effort having been made to regain her place in the Art of Church Architecture. I do further anticipate that her works may be judged as exhibiting an absence of the refinement shown in the works of her southern neighbours, but it must be remembered that in England and France political conditions were more favourable to an unbroken development of Art. Where work of any magnitude had to be done in Scotland, however, the results (such as at Melrose) show that the intelligence and ability to adapt appropriately and skilfully available architectural details, and at the same time to give the impress of her own mind upon them, had not entirely died out.—Mr. J. M. Brydon, proposing a vote of thanks to the lecturer, described the paper as one of the most interesting read in the room, either before the Institute or the Association, for many years. He reminded the company that Mr. Blanc came as a representative of the Royal Scotch Academy, and that he was a past president of the Edinburgh Architectural Society, which was the most influential body out of London, because it not only embraced architects, but also painters and sculptors. Proceeding to comment upon the subject of the evening, Mr. Brydon said it would at once strike them that the characteristic feature of the work of Scotland was

ESSENTIALLY NATIONAL,

with all that pure, sturdy independence of which the lecturer had spoken, and which was said to be characteristic of the owners of the

favoured country north of the Tweed. He was struck with the French leaning that was everywhere apparent throughout the work in Scotland, and especially in the later work. That was easily accounted for, because after the epitome of the earlier work of Scotland was laid, and, in fact, of England, so to speak, there came the break which happened at the end of the thirteenth century, which Mr. Blanc, with his kindly disposition, said they would not remember, for it was a war with their southern neighbours, and there was nothing but strife and bloodshed for a century afterwards. That accounted for the fact that nothing in the way of Architecture of consequence was going on in the northern part of the island while it was still proceeding in the south. When the work was renewed, instead of following the examples of England and the southern countries, the Scotch struck out in a line of their own, and developed what is now known as Scottish Ecclesiastical Architecture of the later Gothic. It must strike them that such work as in the church at Stirling, with its magnificent east end, and the beautiful crown towers of Aberdeen and Edinburgh, were peculiarly Scotch, and could never have been done anywhere else but in Scotland. He was especially struck with the front of Aberdeen Cathedral, with the peculiar French tracery and the pear shape of the *fleur-de-lis* forms. They would find almost a replica of that in the Church of St. Gervais in Paris. With regard to the

BEAUTIFUL EXAMPLES OF GROINING,

there were one or two not mentioned by the lecturer, and notably that of the north porch of the Abbey at Dunfermline, which, he thought, was of the fourteenth century. It was one of the richest pieces of groining to be found anywhere, either in England or Scotland.—Mr. R. Phené Spiers, in seconding, said there was a distinct character in all Scotch Architecture, which showed that it was not copied at all from English or French work. It was ten years ago since he paid his only visit, he was sorry to say, to Scotland, but he made a great number of drawings of abbeys and churches, and he was particularly struck with the simplicity of them. In the Church of Stirling he noticed the clever way in which the upper portion of the tower was built, and also the extremely picturesque effect of the west side—it was most charming. If drawn in line on paper it looked nothing at all, but in the actual building they got the greatest possible charm. It was, in fact, a proper treatment of a simple church tower. There was great beauty, too, in the decorative carving of the churches, something entirely different from either that in France or England. In Roslin Chapel he thought there was some foreign influence, more foreign than the French spoken of, in fact, something Portuguese or Spanish. That was a point upon which he was still not satisfied, but he thought it must have been so after seeing the view exhibited. There must have been some new influence, or the architect's originality was of extraordinary power for him to have drawn something from his mind entirely different from the others. Then the setting back of the windows of the churches struck him as giving great strength to the sides and central mullions.—Mr. Beresford Pite said down south they were accustomed to overlook a great many of the benefits that arose from a visit to north of the Tweed. They must remember that Mr. Norman Shaw came out from that office, and those who had had the pleasure of hearing Mr. Ruskin in London knew that his speech was marked with the northern accent. It did appear that Scotch Architecture, in the Gothic period, had troublesome times. He supposed the country was only partly civilised. There was

A WANT OF COHERENCE

in the mediæval design which they did not find in England. They had heard a great deal about buttresses and windows and detail, but of no marked coherence in design; in fact, it was absent. The rugged quaintness which, by the way, survived in the corbelling and so on, was interesting. There were very few traces of solid æsthetic bases in the scheme, and if they took out the tracery in the Scotch churches they

* A paper read before the Architectural Association on Friday, March 11.

were a little doubtful whether they were Norman or Spanish. He could not help wondering where the Scotch crown tower came from. It was a beautiful idea; the delicate composition seemed altogether foreign to the period in which the buildings were erected.—Mr. Thomas Arnold said, with regard to the lecturer's remark that building practically ceased during the times of the wars of independence; it was scarcely so, because Elgin Cathedral was built during that time, and Melrose and many others were built during the time of Bruce and his successors.—The Chairman (Mr. Pratt) said he had seen many of the buildings alluded to, and of them Roslin Chapel was a puzzle to him, for its extraordinary detail, and especially the carving.—Mr. Hippolyte Blanc, responding, said he was aware there were many points he had not mentioned, but when he told them he had about five hundred photographs, they would see the difficulty in weeding them out. There were

SO MANY POINTS OF INTEREST

in Scotch Ecclesiastical Architecture that it would have been better, perhaps, if he had limited himself to the work even of the fourteenth century only. It was true that Robert Bruce gave large sums for building Melrose, but that was not to apply until after his death, and then there was some trouble, and it was difficult to exactly state what was built during the fourteenth century. Of what remained of that period rather tended to show that abbeys and cathedrals were slightly altered and added to, but in no way of great importance until after the middle of the fourteenth century. As to the influence of Scotland upon England and England upon Scotland, he would invite the holiday Association to go to Scotland and allow him to lead them over many of the interesting works, where they would find not altogether that marvellous in expression of barbarity, but rather, in most instances, even in the crudest examples, a touch of that refinement and beauty which was well known to belong to the Scotch nature. In Melrose they had beautiful examples of artistic imagination. He would suggest that one season the Association should make arrangements to enable it to visit the interesting work in a confined area in Scotland, where they would be given a very hearty welcome. They might exchange visits, by the Scotch Association coming south.

SIGNOR LUIGI CAPUCCI, an Italian architect, who has just returned after a long captivity in Abyssinia, sketches "the real Menelik" in somewhat new colours. According to Signor Capucci, the Negus is little better than a savage, and neither he or his subjects have the smallest desire for civilisation. In their palace, except a sewing-machine and a bare four-post bed, there is not a scrap of European furniture, not even a chair or a table. The works of Art presented by foreign Governments are piled up in a shed.

An interesting point has been settled by some excavations which have been carried on in connection with Carfax Tower at Oxford. The exact date of this tower has long been a subject of dispute. Some Anglo-Saxon coins belonging to the reigns of Edward the Elder and Athelstan have been discovered, and it is considered on the evidence of these that the date of the tower cannot be much later. The restorations of the tower are proceeding apace under the direction of Mr. Jackson, R.A.

The Irish antiquities which Mr. Redmond and the Irish Nationalists are asking the Government to induce the authorities of the British Museum to transfer from Bloomsbury to the National Museum at Dublin, consist, it is stated, of a number of gold ornaments of late Celtic period, among them a model of a boat and oars. They were discovered in the north-west of Ireland, and as treasure-trove found their way eventually and in the ordinary course to the Department of Mediæval Antiquities and Ethnography in the British Museum. By the Act of Parliament constituting the Museum the trustees have no power to comply with the request of the Irish members.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
March 23rd, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slatz; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

MR. KIRBY, of Liverpool, assessor for the new Fylde Workhouse plans, has made his award as follows:—1. £150, Messrs. Crickmay and Sons, Westminster Chambers, London; 2. £100, Haywood and Harrison, Accrington and Lytham; 3. £50, Mr. Morton, South Shields. About twenty architects competed. The assessor was recommended by the Local Government Board. The estimated cost of the new house is £36,000, exclusive of land, and it is to be built at Wesham, Kirkham, on a site purchased from Lord Derby.

THE assessor for the new technical school at Barrow-in-Furness, Mr. H. Lord, of Manchester, has selected the design marked "Hæmatite," as the best in the competition. The authors are Messrs. Woodhouse and Willoughby, of Manchester, who, therefore, secure the first prize of £50. The design marked "Expect," and the work of Messrs. Wood and Hutchings, architects and surveyors, Tunstall and Burslem, has been selected for the second prize of £20. Twenty-five sets of drawings were submitted. The building is estimated to cost about £9000.

WHILE at one part of Paris the Exhibition contractors and constructors are busy, the demolishers are energetically engaged not very far away in effacing the last vestiges of the Cour des Comptes, and of the barracks near it. These works, undertaken by the Orleans Railway Company, for the purpose of transferring their terminus to the Quai d'Orsay, were, like those of the Exhibition, temporarily delayed by the bad weather. Now, however, that there are signs of spring, the preparations for the construction of the new railway station are proceeding with rapidity. It is expected that the ground will be thoroughly ready by June, and that then the erection of the terminus will be commenced. The enterprise is one of considerable magnitude. The Orleans line will be prolonged through a tunnel from the present station at the Botanical Gardens entrance as far as the Quai Saint-Bernard. There will be an open cutting to the Sully Bridge, and at this point the railway is again to disappear underground as far as the Quai d'Orsay.

THE Bristol Fine Arts Academy Exhibition promises to be one of the most successful and interesting ever promoted by the committee. The number of exhibits—439—is about the same as last year, but a marked improvement is noticeable in the quality of the works, many prominent artists being represented. There is a large landscape by Mr. F. J. Waugh, an American artist. This work and three others by the same artist have never been exhibited in England before. Mr. T. C. Gotch, of Newlyn, contributes a work which has gained many distinctions. Amongst other pictures of the Newlyn school, Mr. Walter Langley sends a

large water-colour picture, showing the exterior of a typical Cornish cottage. One of the best pictures in the exhibition is that sent by Mrs. Ernest Normand (Henrietta Rae) entitled "Zephyrus Wooing Flora," which was exhibited at the Royal Academy in 1890. Some interesting pictures are contributed by artists, members of the Academy, including one of the interior of St. Peter's, Rome, by Sir Wyke Bayliss, who is a vice-president of the Bristol Academy, and one of its professional members. Mr. J. W. North, A.R.A., also sends an important work. Amongst the other artists represented are Messrs. Edgar Bundy, John Finnie, Spenlove-Spenlove, Harold Speed, Alfred Parsons, A.R.A., C. E. Johnson, J. H. Henshall, R. W. S., Chetwood-Aiken, Solomon J. Solomon, A.R.A., John R. Reid, J. Noble Barlow, Melton Fisher, Arthur Wardle, W. H. Bartlett, and many others.

A CERTAIN section of our young painters may now be regarded as steady contributors to the French Exhibitions. In some cases work not seen to very great advantage at Burlington House gets a better chance in the Paris galleries a year later; in some the artists send their first direct from the London studios. In both the French Salons it is understood that there will this year be considerable changes. The old Society and the young will open on May 1st, and the divergence between the schools will be brought into sharp contrast by the hanging of both series of pictures in parallel galleries on the Champs de Mars, while the ground floor of the building—the Galerie des Machines—will be devoted to sculpture. Artists intending to contribute will take note that pictures and engravings must be sent in between the 24th and 26th of the month, sculpture from the 29th to the 31st.

THE loan collection of Art objects from the South Kensington Museum in the Birmingham Art Gallery has recently been changed, according to annual custom, for fresh specimens, especially selected for the city. The new collection, which is extremely interesting, includes a case of metal-work—Russian, Dutch, German, French, and Italian; a case of European porcelain, chiefly of the eighteenth century, including fine specimens of Sevres, Dresden, Danish, Dutch, Belgian, and Italian china; and a third case containing examples of various enamels, particularly some very fine Limoges enamels of the thirteenth, sixteenth, and seventeenth centuries; modern Russian work, candlesticks, boxes, and scent-cases; Battersea enamel of the eighteenth century; a very crudely-coloured little box of Bilston enamel; Spanish jewelled crosses, in gold and enamels, of the seventeenth and eighteenth centuries; and French and English enamelled watches of the eighteenth century. A fourth case is devoted to bookbinding and leather-work—Italian, French, German, Persian, and English—from the fifteenth to the eighteenth centuries. The collection also includes examples of German, Flemish, and Swiss stained glass of the sixteenth and seventeenth centuries, and examples of lace and embroidery of different countries and dates.

MESSRS. SOTHEY, WILKINSON, AND HODGE recently sold a small collection of engravings, framed and in the portfolio, comprising fancy subjects by masters of the English school, some printed in colours. The highest price of the day was paid for an open letter-proof of the well-known engraving by W. Ward, of "The Daughters of Sir Thomas Frankland," after the picture by Hoppner—£380 (Vokins). The rise in the value of this engraving is very noteworthy; until quite lately it realised a comparatively small amount when it occurred in the sale-room; about six years ago Lord Cheylesmore paid £200 for a very beautiful example, with full margins, and in the finest possible state, and since that time the few examples which have occurred in the sale-room have sold for very high amounts. The example sold had comparatively narrow margins, and a somewhat similar example sold for £200 as recently as November last. Another highly "fancy" price was paid for a proof with etched letters of Valentine Green's

engraving of "The Ladies Waldegrave," after Sir Joshua Reynolds's picture—£330 (Colnaghi and Co.) The sale also included the following:—"Summer" and "Winter," after F. Wheatley, by Bartolozzi, in colours—the pair, £129 (Sabin). The day's sale of 160 lots realised £1380 5s.

LECTURING ON "Indian Art" at the Walker Art Gallery, Liverpool, Mr. C. Purdon Clarke, director of the South Kensington Museum, said the nucleus of the present Indian collection at the South Kensington Museum was the old East India Company's museum. That was transferred by the Government of India to the charge of the Science and Art Department in 1880, when it was rearranged and greatly enriched. Two years' travel in India had led him to form two distinct impressions—first, that India was not a nationality; and, secondly, that it was impossible to localise any of the Art styles which all over the country could be found roughly grouped into two classes. Much in India belonged to the topsy-turvy order of things, and in illustration of this he threw upon the screen the façades of the two dwelling-houses which occupy the east and west walls of the new entrance to the Indian Museum. He went on to give numerous examples of early date, illustrating the strong influence of the Greek invasion on the Architecture and ornamentation of the Hindoos and Moguls in after ages. Many exceedingly interesting examples of woodwork, mural decoration, and ornaments were shown, and from this the lecturer proceeded to deal with the influence of Italian artists in India in the seventeenth century, giving as a case in point the Hall of Audience at Delhi, this being unmistakably Italian.

THE Lockwood Exhibition at the St. James's Gallery consists of some 500 sketches. The great majority relate to incidents in the Courts, but those who know more of the House of Commons than of the Royal Palace of Justice will find plenty to amuse them. Perhaps the caricatures which attract most attention are those which Sir Frank Lockwood drew while appearing before the Parnell Commission.

It has been found impossible as yet to complete the building of the Collegiate Church of St. George at Jerusalem. The season has been unusually stormy, and many cases of marble and other artistic work for the fittings of the church have only just arrived, while others which passed Jaffa on December 8th have not reached the Holy City, and some of them have not even been heard of. The church forms part of a group of buildings of a very interesting character, which already contains a house for the Bishop, and will be completed by the erection of a clergy house. As these works are in rapid progress the delay will be advantageous in the end, as it will secure the opening of a much more dignified set of buildings than would otherwise have been the case. The site is an admirable one, and the buildings solid and architecturally impressive, but of much less pretentious and aggressive character than many of those which encumber this part of Jerusalem.

Good prices were obtained for water-colour drawings at Christie's the other day, 450 guineas being bid for "Peace and War," by David Cox; 350 guineas for "The Bridge of Sighs," by S. Prout; 310 guineas for a village scene with peasants, horses, pigs, and ducks, by Birket Foster; 440 guineas for a view of a castle and harvest fields, by P. de Wint; and 290 guineas and 205 guineas respectively for a Scotch moor with sportsmen, and Loch Lomond, by Copley Fielding. Among the most important of the pictures were "Autumn on the Thames," by Vicat Cole, R.A., 450 guineas; "When Eventide Approaches," by H. W. B. Davis, R.A., 280 guineas; "Canterbury Meadows," by T. S. Cooper, R.A., 280 guineas; and "A Summer Evening," by J. Linnell, sen., 290 guineas. About £8500 was realised.

THE plans that have been recently made public for widening Jewin Street, in consequence of the recent disastrous fire, and for

connecting it with West Smithfield by means of a road through the centre of the parish of St. Bartholomew the Great, will have as a consequence, if carried out, the demolition of the beautiful Early English gateway which leads from the old Priory into Smithfield. As this could be avoided without much difficulty, it is to be hoped that strenuous efforts will be made to preserve such an extremely interesting relic of the 13th century.

It is understood that no memorial to the late Prince Henry will be placed either in St. George's Chapel or in the Queen's private chapel within Windsor Castle. A life-size bust of the Prince in white marble has been produced by the Countess Gleichen, and it now rests upon a pedestal in the Grand Corridor. Its position is midway between the central elbow and the inner end of the corridor, so that the ordinary visitor might not see it all. The likeness is distinctly good, and the full beard and hair have been treated with a naturalness that is not always achieved by more practised sculptors. The shoulders are perhaps a little fuller than exact portraiture would sanction; but the work is quite adequate, and a replica of it, prepared under the supervision of the Countess Gleichen, from her own studio, is said to be designed for one of the vacant niches in the ambulatory of the Royal Mausoleum at Frogmore.

THE large equestrian picture of the Prince of Wales and the Duke of Connaught, which was recently completed by M. Edouard Dédalle, has now been placed permanently in a mural panel created for it by the removal of three mirrors from the west wall of the State Dining-Room in Windsor Castle. The framework is formed of gilt mouldings in unison with the Chippendale carvings upon the doors, and there is an effective arched Tudoresque moulding across the upper line of the painting, which imparts to it a decorative completeness, the lower line being supported in effect by the immense sideboard. Alone in the suite of rooms comprising the East Terrace, the dining-room hitherto possessed no pictorial relief upon its walls, and the result of the change is distinctly pleasing.

WRITING on the subject of the proposed Westminster Improvement, Mr. Norman Shaw, R.A., says: "With reference to an article which Mr. Warren has written in the Fortnightly Review, I will not take up space excepting so far as to point out two of the most important points in which he is under a misapprehension. The proposed embankment is not to be the width he says; on the contrary, it will be as wide as that portion of the Embankment with which it will ultimately be connected—a width, in my opinion, amply sufficient to give dignity to the scheme. Secondly, the picturesque surroundings of the Abbey in which Great College, Cowley, and Barton streets lie will not be touched by the proposed alterations. Mr. Warren's errors have probably arisen from the fact that he has too hastily formed his opinion upon the rough scheme as deposited with the Bill and not upon the final arrangement of it."

LADY HENRY SOMERSET has sold to the Corporation of Reigate, for £300, an acre and a half of land in the centre of the town as a site for municipal buildings, on condition that if such buildings are not erected her ladyship shall have the option of re-acquiring the land at valuation. There is a justification for this arrangement in the fact that, although the members of the Town Council are agreed that their new headquarters are urgently required, they are hopelessly at variance on the question of site. The municipal borough contains the two towns of Reigate and Redhill, and the latter, being the more populous, is stoutly pressing its claim to be the seat of local government.

THE following is the text of the memorial to the London County Council from persons residing in the area of the proposed Westminster Improvement Scheme:—"We, the

undersigned, residing or carrying on business within the area proposed to be compulsorily acquired by 'the Victoria Embankment Extension and St. John's (Westminster) Improvement Bill,' appeal to you, without distinction of party, to instruct solicitors and employ counsel to oppose the said Bill at every stage, and we make this appeal on the following grounds:—1. That, while the necessity of a real public improvement might warrant the eviction from their homes and places of business of so large a number of private citizens, it is manifestly unjust to grant such power of wholesale disturbance, which would mean ruin to many tradesmen depending upon local custom, to a private company seeking its own profit. 2. That the proposals of this private company, or syndicate, do not in any real sense provide public improvements, because—(a) no real extension of the Victoria Embankment is proposed, as the provisional plan clearly shows, the intention of the syndicate being to acquire the valuable site between the Victoria Tower Gardens and Lambeth Bridge for the erection of residences for the rich; (b) the proposed arrangement of streets is not based upon the necessities of traffic, but purely upon the creation of remunerative building sites, and the proposed junctions with Horseferry Road would be awkward and dangerous; (c) it is proposed to block up the natural avenue of approach to the parish church of St. John the Evangelist, to the great inconvenience of parishioners and detriment of architectural effect. 3. It is not expedient to intrust sites of historic interest and national importance, in close contiguity to the greatest monuments of the nation, to a private company which is bound to place the interests of its shareholders before those of the general public."

THE scene under Waterloo recently was quite uncanny in its gloom and obscurity and multifarious activity. There were three contractors concerned—the builders of the line, and the electric and hydraulic engineers—and between them they appeared to have quite a host of workmen. The extensive galleries that have lain so many years dark and silent and deserted will soon become as busy and bustling as the huge station above, the platforms of which lie about 35ft. above the new line; and as this new line runs right across from one side of the station to the other, connection between each of the upper platforms with those below has been an easy matter.

THE whole of the great station at Waterloo rests upon a series of arches running lengthwise across the line. These have been utilised for the station of the new electric railway which enters them at the end nearest the river, runs through the whole length of them, and trails off into an open space on the south side of Waterloo, where there are siding lines and shunting points. The electric trains will take four or five minutes to run from one terminal station to the other, and at their lowest dip under the middle of the river they will be at 60ft. or so below Trinity high-water mark. The rush down on one side will go far to carry the train up the incline on the other, so that no great expenditure of electric power will be necessary, but there is an extensive installation of generating machinery just beside the line at its southern end. During the busiest periods of the day trains will run as rapidly in succession as they can be cleared and re-started, but there is a separate tunnel each way, and only one train will be in a tunnel at a time, so that a collision cannot occur.

It has been resolved that the historical bridge of Trajan, across the Danube at Turn Severin and Kladova, is to be rebuilt. Roumania undertakes to build the bridge and Serbia the railway from Kladova to Nisch. The bridge will be built on the identical spot where the old one stood. The Roumanian engineers have ascertained that the old pillars still existing will bear the new structure. In the middle of the bridge a statue of the Emperor Trajan will be erected.

Barcelona.

PICTURESQUE CITIES AND MONASTERIES OF THE NORTH OF SPAIN. FROM A DRAWING BY F. HAMILTON JACKSON.

SCAFFOLDING is being erected round the eastern end of Kensington Palace, and the estimates contain a sum of £15,000 for further restoring the staterooms and banqueting-house. The interior is in such a forlorn and dismantled condition that this sum will clearly be insufficient to put it in a proper state of repair. And when this is done it will require to be furnished; and if furnished and decorated in the mode of 1900, it will have no connection with any of its antecedents, and can be of no interest whatever except to those who wish to pay a pilgrimage to the Queen's birthplace. It would really have been better for it to have been turned into the National Portrait Gallery, or, better still, into the Gallery of British Art, as was proposed.

THE death occurred recently, at his residence, 49, Inverness Terrace, of Mr. Deputy Edmeson, at the age of 74 years. The deceased was one of the oldest practising architects in the City. He was one of the arbitrators appointed by the Board of Trade in architectural cases, and he also held a similar appointment in connection with the City of London Court. He was a Fellow of the Royal Institute of British Architects and the Institute of Surveyors, and a member of the Association of Surveyors. The deceased was also the late chairman of the Society for the Encouragement of Fine Arts.

THE Inner Temple (King's Bench Walk) Bill came before a Select Committee of the House of Lords last week. Mr. Balfour Browne, in the course of his opening statement for the promoters, said that the Thames Embankment Act, 1862, provided that no buildings other than porters' or gardeners' lodges should be erected on any part of the lands to be acquired or reclaimed lying between the River Thames and the gardens of the Inner and Middle Temples. At the present time, however, great need had arisen for the provision of further accommodation within the Temple precincts, and that could most easily and conveniently be provided by the erection of buildings in continuation of King's Bench Walk in a southerly direction towards the river. To do this, however, a portion of the reclaimed lands would have to be built upon.—Mr. Pope, on behalf of the County Council, urged that private and not public convenience would be served by the Bill. The land in question had been reclaimed at the cost of the public, and the Inner Temple had in no way contributed to the cost.—Mr. Littler and Mr. Clode, representing the District Railway, having addressed the Committee against the Bill, the Committee, after a brief consultation, found that the preamble of the Bill was not proved.

At the Devon Winter Assizes held recently, before Mr. Justice Bingham, the case of *Allen v. May* was heard. Plaintiff, an architect of Kingswear, claimed commission for the preparation of plans.—The defence was that plaintiff exceeded his instructions, and there was a counter-claim for £50.—In cross-examination, the defendant said he had never had anything to do with building matters before. He came to an agreement to pay Mr. Allen 2½ per cent. for plans for a house costing £1500, and 2½ per cent. for supervising the erection. The plans were discussed at each interview to get them reduced. Defendant denied that he was continually asking for things which Allen said would increase the cost.—The counter-claim having been withdrawn, Mr. Foote, who represented defendant, said definite instructions were given that the plans should be for a house to cost £1500. The only question was whether the increase was due to alterations suggested by defendant. Mr. Allen took a lot of trouble over the plans, but he asked for the work, and was told the terms upon which he could have it.—Mr. Bullen, replying for the plaintiff, pointed out Mr. Allen wrote defendant definitely that all he wanted could not be done for the sum stated, but if he wished to have a design for £1500 he could have it, but he would have to forego certain luxuries.—The jury found for plaintiff, and his Lordship awarded him £75.

THE tomb of Thothmes III. has just been discovered at Thebes, in the Valley of the Kings, by M. Loret, the Director-General of the Museum. Two staircases, a corridor, and seven rooms—of which two are ornamented with paintings in an admirable state of preservation—have been unearthed; and a sarcophagus, unique of its kind and almost intact, was discovered in one of them.

A SPIRAL railway tower is being planned as one of the features of the forthcoming Pan-American Exhibition at Niagara Falls. The building will be erected on Cayuga Island, and the general design is as follows:—A steel skeleton tower, about 500ft. high, and 80ft. diameter at the base, and 50ft. diameter 400ft. above the base. Around the erection, supported by strong brackets, a spiral railway will be constructed, which will pass ten times round the tower in reaching the 400ft. platform. The motive power will be electricity, and various safety appliances will be used in connection with the track. The spiral railway will be double, providing for independent up and down tracks, 20ft. apart. It is estimated that this tower will only cost some two-thirds the amount expended on the famous Ferris wheel at the Chicago World's Fair.

MR. H. E. Moss intends presenting London and Londoners with a grand hippodrome. The proposed site for the building is in Cranbourne Street, Leicester Square, within a stone's throw of two other great places of amusement. The structure itself will be designed on novel lines, embodying all the latest English and Continental improvements, and will include, apart from the theatre, a restaurant, a fully-licensed hotel, shops, and residential chambers. It is believed that the building will eclipse in size any other place of entertainment in the country. It will be known as "The Hippodrome."

It is worth while noting that William Edwards, the bridge architect of Glamorgan, who first spanned the Taff at Pontypridd in 1747, derived a great deal of his masonic principles by the unwearied study of Caerphilly Castle. Mr. Edwards' manner of dressing the stones and hewing them was exactly similar to that of the Norman builders, and he put them together in a style of closeness, neatness, and finish such as could not have been surpassed by the noted, though unknown, builders of Caerphilly, Neath Abbey, and Morlais Castle.

MR. G. F. BODLEY, A.R.A., has reported to the Dean and Chapter of Peterborough on his recent inspection of the west front and other parts of the Cathedral which are showing signs of weakness. Happily the great arch on the south of the west front is not in so bad a state as the northern one, and he hopes they may be able to keep it up. Mr. Bodley thinks that by carefully grouting with liquid grout from the top of the arch, and other means, much may be done to strengthen it, but it has yet to be seen how far this would be sufficient. The whole of the front has gone considerably out of the vertical, and is a good deal shaken, and the gable is so weak that he fears it must be re-set. The walling behind the ashlar face is in so bad a state that he thinks no method of strengthening the wall is here practically possible, though he laments the necessity of its being taken down. The stone is so perished and the masonry is so shaken that it would not be feasible to back the existing wall of the gable and get sufficient strength for it. This work should be taken in hand at once. Mr. Bodley had also drawn attention to urgent repairs needed in the walls of the eastern chapel. The estimated cost of the whole of the work is £8659, and that which it is urgent to undertake at once would cost £2739. At a meeting of the Restoration Committee it was decided to proceed with the more urgent work.

At a recent sitting of Chester County Court his Honour Sir Horatio Lloyd was engaged for several hours in hearing an action brought by Daniel J. Kennedy, surveyor and architect,

Liverpool, to recover £31 10s. from John Bird, Pantasaph, for professional services and expenses incurred. Plaintiff's case was that while he was engaged doing some work in the neighbourhood of Holywell Convent for Mr. Kirby, architect, Liverpool, he was introduced to defendant, and subsequently he prepared plans for the erection of nine cottages and a shop at Holywell for him. The plans were passed by the Urban District Council, but at the last moment defendant was not able to raise the mortgage money, and accordingly was not able to carry the work out, so plaintiff did not prepare the specifications. Finally plaintiff pressed for the payment of his bill, and defendant offered him three guineas. Plaintiff estimated that the work could be done for £1100, and he charged commission at the rate of 5 per cent., but as the specifications were not prepared he reduced that by half.—For the defendant it was contended that this was an arrangement based on friendship. Plaintiff went down and stayed occasionally with defendant, who did not charge him anything, and Mr. Bird being anxious to help plaintiff in his business, introduced him to Mr. Montgomery, a brewer. There was no understanding as to payment for the plans, and defendant did not adopt them because he was informed by a builder and another gentleman that if the buildings were erected according to them they would cost something like £2000 instead of £1000. It was further claimed that plaintiff was not entitled to commission in a speculative transaction of this kind.—His Honour, in giving judgment, said he could quite understand that owing to the hilly nature of the site of the proposed buildings plaintiff's work was not easy. On the other hand, he was very much impressed with the idea that the parties met in a friendly kind of way, and that there was a good deal of mutual obligation. Plaintiff was desirous of getting work from Mr. Montgomery, and defendant helped him in the matter. With regard to the contention that the plans could not be carried out at the proposed cost, he pointed out that it was often necessary to ask architects to cut down their plans. Under all the circumstances, he should give plaintiff a verdict for ten guineas, with costs on that amount.

In the Queen's Bench Division recently, before Mr. Justice Wright, an action was brought by Mr. George Dennis Martin and Mr. Edward Keynes Purchase, architects and surveyors, formerly carrying on business in partnership, against Mr. William John Rafferty, to recover £700 under agreement dated March 11, 1895. Defendant denied liability. It appeared that in March, 1895, the defendant was the owner in fee simple of some land at Bayswater which he was desirous of letting on a building lease at a ground-rent or selling. By an agreement dated March 11 the defendant agreed to pay the plaintiffs a certain commission if they let the land on a building lease at a ground-rent. There was also a clause in the agreement to the effect that if the defendant should let the land to a tenant not introduced by the plaintiffs at a ground-rent not exceeding £600 a year, he would pay them £350 in full settlement; and that if the ground-rent exceeded that sum, the plaintiffs should receive one-half the excess, calculated at fourteen years' purchase. Plaintiffs' case was that they used their best efforts to let the land, and that while they were in negotiation with certain persons who were likely to take the site on a building lease, the defendant let the land to a Mr. Schofield, who was not introduced by them, at a ground-rent of £675 per annum. Therefore they said they were entitled to recover £700.—Defendant denied that plaintiffs used their best endeavours to let the land, and contended that under the agreement he was relieved from liability, inasmuch as he had to abandon the letting of the land, and to commence building thereon.—Mr. Justice Wright said in his opinion the defendant never did abandon the intention of letting the site, though he took steps to begin building operations in order to save the County Council license. There would be judgment for the plaintiffs for the amount claimed, with costs.

Surveying & Sanitary SUPPLEMENT.

MARCH 23RD, 1898.

Reservoir Embankments.*

BY WILLIAM FOX, M.INST.C.E.

DURING his professional career the author has had frequent opportunities of studying the construction of reservoir embankments, having carried out several works of this description, in some of which temporary failure has been experienced, causing much anxiety and trouble, although the remedies which were applied were in all cases ultimately successful. Some of these instances will be referred to later on. The author will first make some general remarks on the subject, and will then go on to describe some instances where difficulties have arisen, and the means adopted to overcome them.

In treating the subject, the author proposes to confine himself to those embankments which are constructed across natural valleys, thereby forming storage reservoirs of greater or less magnitude, and such as are recognised as the most economical mode of storing water for town supplies. The general remarks the author proposes to divide under the following heads:—

(A) Depth and form for the foundation for the puddle trench, and material used for refilling the same.

(B) Form of embankment, material used, and mode of construction.

(A) DEPTH AND FORM OF THE FOUNDATION FOR THE PUDDLE TRENCH.

Even when a suitable site, from a geological point of view, has been obtained, failure may occur through the foundations for the puddle wall not being taken sufficiently deep, not only in the bottom of the valley, but also into the slopes on either side. The author knows of no theoretical rule whereby, having regard to the hydrostatic pressure to which the work

is to be subject, the proper depth into the solid ground can be determined, everything depending upon the closeness or watertightness of the material in which the excavation is made. The author knows of one instance, the material for the foundation being boulder clay, where the excavation was only taken five or six feet below the surface of the ground; and, although a certain amount of moisture is visible beyond the outer slope of the em-

FORFAR WATERWORKS. DEN OF OGIL RESERVOIR.

bankment, the reservoir has been constructed for a number of years, and is to all appearances satisfactory. But such a shallow depth of excavation is not to be recommended, and especially in boulder clay, where beds of gravel may be met with, and where the only sure guarantee for safety is to take the excavation to a very much greater depth.

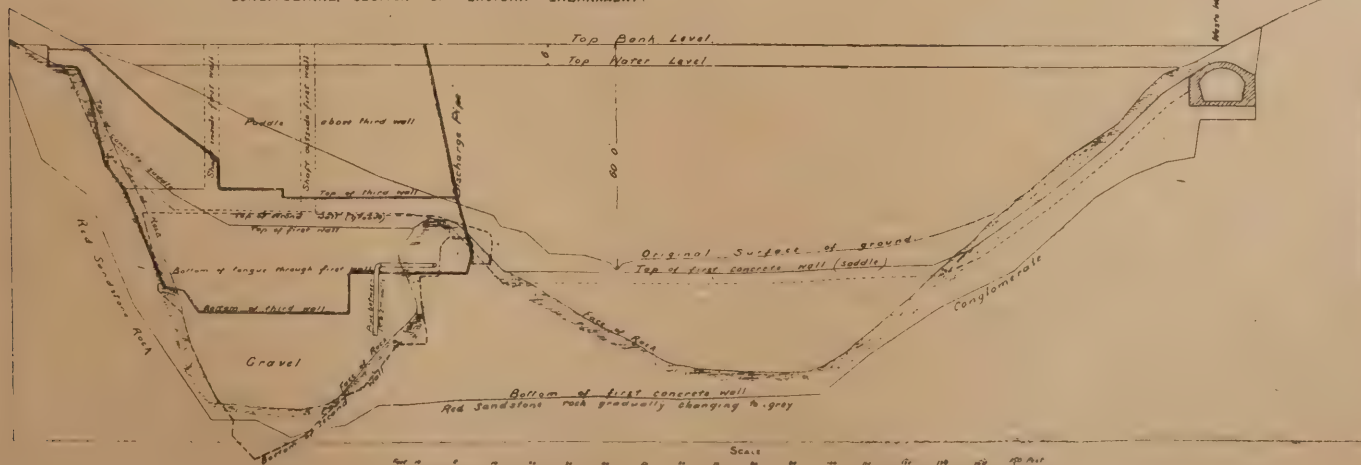

An absolutely impermeable foundation is

probably never obtained; springs, more or less even in clay, will be found, and only experience can determine when these are in such a position, or of such insignificance, as to be considered harmless. It has been the author's practice, if water appears in the bottom in quantities exceeding a mere weep, to put in a thick layer of concrete, on which the puddle rests; this has the effect of preventing running water coming in contact with the clay. He has also found it advisable to lead springs away by means of vertical pipes placed on one side of the trench, so as to enable the concrete to set without loss of cement. These pipes have sometimes been brought up to the level of the surface of the ground, and if the water rises in them, continued to the outer slope of the embankment; and in other cases, when it has been found that the water ceases to overflow, they have been run with cement grout and plugged.

The width of the trench is a question on which a great variety of opinion exists. The author considers that if it is to be refilled with good clay puddle, from 8ft. to 10ft. is sufficient for any depth up to 80ft. or 100ft. below top water level, and for comparatively low pressures of 20ft. to 25ft., 6ft. will be enough—of course, provided the clay is of good quality. Where the trench is to be refilled with concrete, a width of 8ft. will suffice to avoid any possible risk of failure.

In several cases where trenches of great depth have been constructed and the water pressure to be encountered was very great, it has been found most expedient to fill the trench, not with clay puddle at all, but with good hydraulic cement. This material, when once it has set and become hard, is not acted upon by running water, and if properly made and of sufficient thickness, is perfectly watertight. As a matter of cost, much will depend upon the facility for procuring suitable material and the price of hydraulic lime or cement; but although a less thickness is required, and a saving effected, not only in the material of the filling, but also in the

FORFAR WATERWORKS. DEN OF OGIL RESERVOIR. LONGITUDINAL SECTION OF EASTERN EMBANKMENT.

* A paper entitled "Reservoir Embankments, with suggestions for avoiding and remedying Failures," read before the Society of Engineers on March 7th, 1898.

excavation of the trench, it usually turns out more expensive than puddle.

Although good, fresh burned blue lias lime, ground before slaking, makes excellent concrete, it is more usual now to substitute Portland cement. The greatest objection to hydraulic lime is its comparative slowness in setting, and the difficulty often experienced in getting lias lime uniform in its chemical components, and sufficiently finely ground; but on the other hand, if disturbed during the process, provided the lime is not washed out, the concrete will reset or grow, a property which Portland cement does not possess. If lime is used, the author usually makes it in the proportion of one of lime to four or five parts of broken stone and sand, measured by bulk. Portland cement concrete, for puddle trenches of the dimensions previously stated, the author makes in the proportion of one part of cement to five or six parts of broken stone or sand; or, if there is much water in the trench, it may be advisable to increase the proportion of cement to make up for the possibility of some being washed out.

(B) FORM OF EMBANKMENT, MATERIAL USED, AND MODE OF CONSTRUCTION.

The author believes that invariably in this country, although elsewhere the method is departed from, it is usual to render the embankment watertight by a wall or core of clay puddle brought up from the trench previously described. The designing of this part of the embankment is a subject of greater diversity of opinion than any other.

The author's experience has been to bring the puddle up to within a foot of top bank level, where it is 8ft. or 9ft. thick, and increase downwards with a batter of 1in. in the foot on each side, so as to be 18ft. or 19ft. thick at 6ft. below top bank level. An instance will be referred to later on where, having had to cut into and remove some of the puddle wall, it was found to be quite sufficient, the wall being entirely impervious to water even with a pressure of 50ft. or 60ft. although the clay obtainable for puddle was far from being of the best possible description.

The height between top bank level and top water level of course depends upon the depth that the water is calculated to run over the waste weir, and the estimated height of the wave which may be formed by the wind blowing down the reservoir, having regard to the length of reach and the position of the embankment with reference to prevailing winds; but, in the author's opinion, this height, even with small reservoirs, should never be less than 4ft. after the embankment has done settling, and with large reservoirs 6ft. to 8ft. may be desirable.

The width of the top of the embankment is not, in the author's opinion, so material as the width at top water level, which is governed by the distance between top water level and top bank level and the slopes to which the embankment is to be constructed. Assuming these slopes meet at top bank level at the centre line, the top water is 5ft. below top bank, and the slopes 2 to 1 on the inside and 3 to 1 on the outside, the width at top water level will be 25ft. This will leave ample protection to the puddle to prevent its cracking in dry weather, which, if not protected, may become a great source of danger.

It is convenient that the embankment should be at least 10ft. to 12ft. wide at the top, and this may be obtained either by making the slopes above top water level somewhat steeper, or instead of their joining at a point at top bank level to design them any convenient distance apart or by a combination of both arrangements.

In addition to this, the author has in two instances, where the reservoirs have been made in the lias clay, formed the lower part of the toe of each slope of dry rubble or burnt ballast, with very satisfactory results. The inner slope of the embankment is, of course, always protected from wash by dry rubble pitching, brick, or concrete.

The author has found that clay spread in layers about 8in. or 9in. thick, well watered, twice cut and trodden, gives a very satisfactory result, although it is necessary sometimes

to use tempered clay in the trenches, on account of the difficulty of cutting and treading the clay between the timber used for supporting their sides. The author believes that the mode above described is cheaper than tempering the clay beforehand, but it is not so expeditious, as the latter system permits of clay being dug and tempered at such times as are convenient, and when the weather may be unsuitable for other progress being carried on. The author requires those parts of the embankment nearest to the puddle to be made of the finest and most argillaceous material obtainable, and put in in 2ft. layers; the most stony material being retained for the outer parts of the slopes, which may be put in in 4ft. layers, the layers being concave towards the centre of the embankment.

It generally happens that in districts in this country where large storage reservoirs are being made, the rainfall gives sufficient water to consolidate the material as it is put in place, and, although it is desirable that the material should not be too dry, if it is watered artificially, it should be very carefully done, in order that the whole of the material gets an equal quantity of water.

In the construction of the embankment it is the author's practice to set the profiles of the slopes somewhat steeper than the slopes are eventually intended to be, and to finish the top somewhat higher, in order that, when settlement takes place, the embankment will assume the shape intended. The amount of this allowance must depend upon the height of the embankment, the time taken in its construction, and the character of the weather during construction.

The author will now proceed to describe a few instances within his experience where difficulties have occurred, and the courses which were taken to render the work satisfactory. He will also describe another instance where these difficulties were anticipated, and the methods adopted which successfully prevented failure.

DEN OF OGIL RESERVOIR OF THE FORFAR WATERWORKS.

The embankment of this reservoir is placed across a narrow glen or gorge, the length being 310ft. and the greatest height 60ft. The greatest depth of water is 50ft. Trial holes were sunk before the work was commenced, in order to arrive at some idea of the depth that it would be necessary to excavate for the foundation for the puddle trench. At the south end of the trench rock was met with at about 7ft. below the surface, and near the bottom of the valley, on the same side, and less than 100ft. off another trial hole disclosed rock at about 5ft. from the surface. It was concluded that between these points the rock would be found at no great depth, and the contract depth for the trench was fixed at this part at from 25ft. to 30ft. from the surface. On opening the ground, a totally different state of things was discovered, for between the two points a deep bed of gravel was found, and the excavation had to be taken down as much as 80ft. below the surface before the rock was met with. The sections (Figs. 1 and 2) show the contract depth of the trench, the actual depth excavated and the nature of the rock met with.

The arrangement for discharging the water from the reservoir is by a 24in. pipe laid in concrete, which was bedded on rock for almost the whole length, a short distance only at the outer and inner ends being upon hard gravel; the valves for regulating the flow being placed at the outer end.

The work was commenced in May, 1879. By September, 1881, the trench had been excavated and refilled, and the puddle wall and embankment carried up some height. With about 26ft. of water in the reservoir a leakage appeared around the discharge pipe at the outer slope of the embankment. To ascertain the cause of this, a heading was driven from the outer end alongside the concrete which surrounded the pipe, to the concrete foundation of the puddle wall. Water was met with coming through the concrete surrounding the pipe, and it was expected that the pipe had been fractured. This was

not, however, the case. The concrete showed no signs of fracture, and when some of it was removed to get at the pipe, the leakage was discovered to be running through the concrete, which was much honeycombed, and, although set very hard, was imperfectly put in place. This was not the only source of leakage, for at the end of the heading water was seen coming up outside the concrete foundation of the trench. To follow and locate this was the only course to pursue. A shaft was sunk from the top for ventilation and for facilities for moving the material, and a second trench was sunk outside the original one. (See Fig. 1.) It will be noticed that at the deepest part this was taken rather further than the original foundation, as it was found that a small flow of water was coming through the rock underneath the foundation on the reservoir side, but by far the greater proportion of leakages was coming through the concrete, which in places was very badly and carelessly put in.

When it was thought that the faulty part of the concrete was all exposed, the second trench was refilled with concrete, the face of the first wall being scored both longitudinally and horizontally with deep grooves to form a tie between the two, and to prevent water following along. The concrete for the original and all subsequent work was formed of one part of Portland cement and five parts of broken stone and sand, no stone to exceed 1½ in. in size. The specification required that the concrete should be spread in 8in. layers, and not thrown loosely into place; from what subsequently transpired, it is doubtful whether this was done in the original work. The cement was tested in the usual manner, and found to be satisfactory.

Although the greatest care was observed in refilling the second trench, the result was not entirely successful. When the second wall had been taken up to within about 6ft. of the top of the excavation, the reservoir was allowed to fill, and in February, 1883, with about 39ft. of water in it, the leakage from all sources amounted to over 1,000,000 gallons per day. Several pipes had been put in during the construction of the second wall, in order to convey any leakage to a basin at the outer slope of the bank, from which it could be sent to Forfar, or down the stream as compensation, as might be desired, the intention also being to be able to control the leakage when collected in these pipes by means of stop valves.

The bulk of the leakage was from a pipe which had been placed vertically between the two concrete walls, with an open end at a spot where the first wall was leaking badly, and there was also a large quantity of water springing up between the two concrete walls. A pipe which was brought up from the bottom on the outside of the second trench, and which was laid to take any leakage which might come underneath from the reservoir, yielded very little water, and the leakage from this source did not increase to any great extent as the reservoir was filled. The result of this work was to collect the leakage and utilise it for the town supply. As time went on the leakage also diminished in quantity, until in June, 1883, it was about 354,000 gallons per day, with water 30ft. deep in the reservoir; this quantity compared with 590,000 gallons, the amount a few months previously, with the same pressure from the reservoir.

The valves on the pipes conveying the leakage referred to before were not put on, it being feared that the result of stopping the flow would be to cause the leak to burst out elsewhere, and possibly at a level from which it could not be conveyed into the pipe to the town. The headings were left open, and the filling of the reservoir continued, in the hope that the leakage, which was all, or nearly all, coming through the concrete, and was perfectly clear, would gradually decrease.

In September 1883, a fresh leak occurred, the water coming through the concrete of the first wall near its junction with the puddle, and although the quantity was insignificant, it was much coloured, indicating a probable waste of the puddle. The water in the reservoir at this time was 44ft. 6in. deep, or 5ft. 6in. off being full. When the water level was reduced to 44ft. 2in., the leakage ran

clear. The level was then kept at about 12ft. at which level the leakage from between the two walls was reduced to 233,000 gallons per day. By the end of 1883, the leakage from between the two walls had further decreased, and the small leak discovered in the previous September had not increased, although at times it was discoloured. Early in 1884, the last leak began to be again discoloured, and a slight settlement in the embankment was noticeable on the surface.

It was then decided that some further remedy must be resorted to. A shaft (Fig. 1) was sunk on the inside of the puddle trench to the level of the top of the concrete foundation. In sinking this shaft a large cavity was discovered about 15ft. from the surface in the original ground, which doubtless to some extent accounted for the settlement as well as the discoloration of some of the leakage. When the shaft had reached the top of the concrete foundation of the puddle wall a trench was excavated alongside it similar to one which had been made on the outside, and taken down for a depth of about 25ft. This excavation disclosed much faulty concrete: although in places it was close and watertight, in other places it was so open that water when poured in ran freely away. When the excavation was taken down to the depth stated it was decided not to go deeper, as the second wall put in would arrest any leakage which might come through the first below that level. The excavation which had been taken beyond the 24in. discharge pipe, so as to cut off the water which was known to follow along the concrete surrounding that pipe, was then refilled with concrete to a little above the level of the old concrete foundation, and in order to ensure a thorough connection being made with watertight work, it was connected through the first wall to the second (Fig. 1). This connection was made by cutting out the first wall bit by bit, in lengths of 9ft. or 10ft., and as each section was taken out, the wall above was supported by a cast-iron pillar about 6ft. long, and the concrete put in and allowed to set before the next section was commenced.

By this means the concrete connection was made without the slightest settlement appearing in the first wall, or in the puddle above. The whole of the ground above the top of the third wall was then cut open from the surface and refilled with puddle and concrete, thus entirely cutting off those parts of the original concrete and puddle through which leakage had appeared in such a form as to cause any apprehension. The headings from the outer slope to the concrete foundation of the puddle wall, and along the top of the second wall, had been kept open all this time, and remained so until January, 1887, when the reservoir was full and overflowing for the first time.

At this time the only leakage that was visible was coming from the pipe that had been fixed between the original foundation and the second wall put in, the bottom end of which was below the concrete connection that had been made between the second and third wall, and, therefore, not affected by the construction of the third wall. The leakage from this source amounted to about 135,000 gallons per day, and as it was perfectly clear, and no apprehension of a further increase taking place, the headings were filled up. Since that date to the present time everything has been satisfactory, and with the reservoir full, in April, 1892, the leakage from all sources had decreased to about 30,000 gallons per day.

It will thus be seen that from September, 1881, to June, 1885, or for nearly four years, the work of discovering and remedying these leaks was going on. Many delays arose through having to make alterations in the mode of proceeding, and although the work was of no great magnitude, progress was slow on account of its having to be carried out in a confined situation and step by step.

It may be suggested that the work on the outside of the puddle wall might have been dispensed with, and a new wall on the inside would have been cheaper and more effectual, besides the saving in time that would have resulted. But it was only by sinking outside the puddle wall that the leakage could be located, and the effect of filling the reservoir

could be noticed, and when the trench was sunk, it was obviously better to refill with concrete than with earth or loose rock. The author considers that the whole cause of the trouble was due to the concrete being carelessly put in.

It is worthy of remark that in no other part of the work where concrete was used was there any sign of failure. This particular part of the trench was refilled just before the frost of 1879-80 set in, and it may have been in the hurry to get the concrete done that the carelessness arose. Be that how it may, the author never wishes to have to undertake again such a tedious operation as discovering and remedying a leak which occurs somewhere in work buried from 70ft. to 80ft. underground.

It is stated that the Royal Commission about to be appointed to consider the various phases of the sewage question will be a small body, consisting, in all probability, of seven members. The chairman will be supported by an eminent chemist, a well-known bacteriologist, a couple of engineering experts familiar with the different methods of urban drainage, and probably two Local Government Board officials specially qualified to speak with authority upon sewage matters.

The Effluent Sub-Committee of the Manchester Rivers Committee has agreed to recommend to the committee, and through it to the City Council, the adoption of a system of treatment of the effluent in place of the rejected culvert scheme. The members of the sub-committee have visited a considerable number of places where various methods of treatment are in force, and they have decided in favour of land filtration by what is termed the biological system. No additional land will be required beyond what is already available at Davyhulme. Various sums are named as the probable cost of the scheme, all of them below the quarter of a million which the culvert was likely to entail as an outlay. One estimate places it as low as £60,000.

DESIGN & DETAIL OF DOMESTIC BUILDING.

BY JOHN E. NEWBERRY, A.R.I.B.A.

I.

IN the following article some notes are given on the design and detail of a country cottage-residence of red brick and tile. Appropriate internal fittings will be considered in a future article. Such a building would be suitable in Kent, Surrey, or Sussex, where tiles and bricks of a charming colour can be obtained.

MATERIALS.—So very much depends on the description of brick and tile used. They should be hand-made if possible, and finished with a sanded face.

THIN BRICKS, five courses to a foot, give scale to a building, but are expensive to use throughout. It is the practice of some architects to point their brickwork with white mortar, some again use grey or pink, but in no case should black be employed, and "tuck pointing" is a vile expedient, completely destroying the effect of "quality." White mortar finished with a fairly wide weathered struck joint is probably the most suitable and effective mode for our purpose.

TILES.—Kent and Surrey furnish hand-made tiles of a rich brownish purple hue. In the course of a few years they weather a still better colour. Valley and hip tiles look more

sists of a single course laid flat on the back of rafter with the lapped tiles above it, the tiles projecting $1\frac{1}{2}$ in. This arrangement enables one to dispense with the objectionable cement fillet, and what little cement is used is kept back from the edge of the tiles. Another small matter that is often not considered is the soffit, or under side of eaves and gables. The old method was just to continue the tile

laths across, so that they show underneath with the tiles between them. This looks far better than being filled in with V-jointed boarding, "stained and varnished."

EAVES.—The eaves should have a good projection of from 12 in. to 18 in., and it is a characteristic method of construction to stop the rafters on the plate and form the eaves by means of "sprocket" pieces. This enables the sprockets to be made thicker than the common rafters, if necessary. They should not be less than $2\frac{1}{2}$ in. or 3 in. in thickness.

A neat method of finishing roof-tiles against vertical brick surfaces is to cut a groove $1\frac{1}{2}$ in. deep to receive the tiles, and then bed them in cement and point up flush. Do not forget to have the tiles tilted slightly where they abut against walls; $\frac{3}{4}$ in. is quite enough.

IN TILE-HANGING, the tiles may be fixed either to wood framing, in which case it is boarded and battened to receive them, or nailed to the brickwork. A good method of hanging tiles to 9 in. brickwork in mortar, is to build such parts in brick-on-edge (garden wall bond), and to nail the tiles into the joints with strong cut nails. This does away entirely with all wood, except at the foot of tile-hanging.

STEPS look picturesque if built of hard red paving brick on edge set in cement, any extra rise over $4\frac{1}{2}$ in. being made up with tiles. Red paving tiles, 6 in. and 12 in. square, are to be obtained, which form capital floors for verandahs, porches, etc.

CHIMNEY-STACKS.—Well considered chimney stacks help the grouping of a building such as we are considering, and an angle nook is an appropriate feature. Personally I consider 9 in. by 9 in. flues amply sufficient, but the stack should have 9 in. external walls to protect the flue from damp and cold. A tile creasing is also useful to prevent the rain from soaking down the stack. A big chimney

always looks well if the parts are properly proportioned and kept delicate in projection. Some very delightful examples of old chimneys have recently appeared in the *BUILDER'S JOURNAL*, but much of their charm would be lost if built with the ordinary-sized bricks, as old ones are a little less than 2 in. in height. The writer has seen bricks measuring five courses to the foot used for the upper part of stacks only with success. A simple form of head is shown on the detail.

WINDOWS.—As already mentioned in the preliminary article, the treatment of the windows is one of the most important considerations in any house. In a cottage, casement windows are suitable and picturesque. The details show moulded wood mullions founded on old examples with a very simple and effective form of iron casement, also similar in pattern to those found in old cottages. Iron casements are preferable to wood, as they keep out draught and rain better, and do not look so clumsy. In a four or five light window it is unnecessary for more than two or three lights to open. A casement window of this description should not be larger than 1 ft. 3 in. to 1 ft. 6 in. wide by 3 ft. to 3 ft. 6 in. high. If a transom is used, the upper part should not be square. A nice proportion is about 3 in. less than the lower light. A few of the upper lights should be iron casements hung on centres, and opened from inside with cords. The face of door and window frames should be kept half an inch back from the face of brickwork. The sill, which should be of English

oak, should project, and either be bedded in white lead on the brickwork, or have a galvanised wrought iron water bar, as shown on detail. A similar bar should be built in with the frame and brick jamb. The internal joinery of these windows is very simple, moulded linings suiting the general smallness of scale.

GLAZING.—These casements and windows should be glazed with clear glass in leaded lights in squares 5 in. to 6 in. wide, and 6 in. to 7 in. high. Quarry glazing is often objected to as obstructing the light and view; the former objection is true to a small extent, but the latter is quite a fallacy. The framework of lead, in the opinion of the writer, adds charm to the landscape, and gives a sense of being inside, which a large sheet cannot do. In the summer the casements stand wide open, the fixed lights forming a good contrast to the open spaces. Lead glazing is also more suitable to iron casements, and enables the section shown to be used instead of a more elaborate and costly arrangement with some form of rebate, which is necessary for a single pane of glass. It also allows the mullions in fixed lights to be merely grooved, instead of being rebated and beaded, as the glass is sprung into position. The lights should be secured to small saddle bars, and they look far better if square, say, $\frac{3}{4}$ in. by $\frac{3}{4}$ in. It is usual to put them on the inside only, but I prefer to put them outside as well for greater security, and also because the horizontal lines give more interest to the expanse of leaded lights.

CURTAINS.—Blinds are unnecessary to these kind of windows. Short thick curtains next

KEY ELEVATION

picturesque if of the old country patterns, which are semi-circular in form. The hip tiles should not lie flat with the roof, and should be neatly pointed with cement kept back an inch from the edge of tile. The old saddle-back ridge is the most suitable termination to the roof. A cheap and effective method of covering a cottage roof is to bed the tiles in hay. With double plastering to the rooms in roof this keeps them warm and free from draughts.

ROOFS.—In designing a small house of this kind the grouping and arrangement of roofs should be carefully studied; the simpler they are, as a general rule, the better they look. A good method of roofing one-story offices is to continue the slope from the main ridge right down to an eaves some 8 ft. above the ground floor. The pitch or angle of tile roofs should not be less than 45° .

HEIGHT OF ROOMS.—An important factor in the elevational treatment is the height of the rooms. 8 ft. 6 in. to 9 ft. in the clear is ample. If more than that is used, it becomes very difficult to treat the windows appropriately, and the whole house is too lofty for a cottage. If more lofty rooms are required, sash windows should be adopted, and the dwelling differently treated from its inception.

BARGE RAFTERS.—A simple form of gable is the "barge rafter," which is the same depth as the common rafters, but should not be less than 3 in. thick; the plates should run through to support them, with additional short plates where required. Much of the effect depends upon the treatment of the roof tiles upon them. They look neatest when the verge con-

the glass answer best. They should be hung on rods fixed close to the head, and should just clear the window board. If to a transom window, they should be in two heights, the lower rod being fixed to back of transom.

THE ENTRANCE DOORWAY should be broad and a better proportion is gained by keeping it low, say, 6ft. 6in. to 6ft. 9in. high, and 3ft. 9in. to 4ft. wide. A framed, ledged, and

braced door is appropriate, and should have neatly hammered wrought-iron strap hinges, which will look all the better if the marks of the hammer are allowed to show.

The colour of the external woodwork is of great importance. Probably a good bright yellowish green, what is known as "fig-green," is the most satisfactory colour: it goes well with the reds of bricks and tiles, and lasts better than white does.

(To be continued.)

At Wesley Rock, Madron, a new Wesleyan Chapel has been erected.

In addition to the projected new Opera House and Theatre of Varieties, in Norwich, it is proposed to erect a first-class theatre. Plans have been prepared by Mr. Sidney Stott.

A new block of buildings is about to be erected at Llandrindod Wells for the London and Provincial Bank, Limited. The directors have instructed the architects, Messrs. Wilson and Moxham, Swansea, to prepare the necessary drawings.

An inquiry has been held at Edinburgh under the Housing of the Working Classes Act. Mr. Cooper, Burgh Engineer, explained the plans of the properties affected under the inquiry. He stated that the total cost of the scheme would be £43,650, the net amount being £21,150.

It has been decided to build a second theatre at Dover, a large plot of land in a prominent position near the sea front having been purchased for this purpose. The theatre, which is to be completed before the end of the present year, is to accommodate about 1500 people.

The fourteenth annual exhibition of the Home Arts and Industries Association will be held on May 19th to 23rd at the Royal Albert Hall, and will include exhibits from Sandringham, Ashridge, Keswick, &c. Competitions and demonstrations in various subjects will be held each day.

The plans are out for the new school buildings by which the centenary of the Royal Masonic Institution for Boys is to be celebrated. They will, indeed, form a notable pile, and, so far as can be gathered from the drawings, will form an artistic ensemble. They are to be erected on an estate at Bushey some sixty acres in extent.

NORTHAMPTON INSTITUTE.

A NEW CITY POLYTECHNIC.

THE formal opening of the Northampton Institute, built in Clerkenwell from the designs of Mr. E. W. Mountford, F.R.I.B.A., took place last week. Broadly speaking, the new Institute in Clerkenwell is to provide the recreative and technical side of a complete Polytechnic. The land upon which the Institute stands is roughly one and a quarter acres in extent, and is triangular in shape, the apex of the triangle resting upon Northampton Square and the base upon St. John Street Road. The block of buildings in St. John Street Road contains the main entrance in the centre, with the large hall on the north, and on the south a four-story building, chiefly, but not entirely, consisting of rooms devoted to the social and recreative work of the Institute. The

NORTHERN SIDE OF THE TRIANGLE,

extending from St. John Street Road to Northampton Square, along Lower Charles Street, consists of the buildings which contain the bath and the gymnasium, each of which is 120ft. long. The former has dressing-rooms beneath, and the latter has over one end of it a three-story building devoted to educational work. The other or southern side of the triangle, in Ashby Street, contains a five-story building entirely for educational purposes. These buildings enclose an internal triangle or courtyard, from which the inner rooms and corridors derive their light. On two of the floors the corridors run completely round the building, the other floors having corresponding corridors as far as

the limits to which they extend. The various floors are reached by three staircases placed at the angles of the triangle formed by the courtyard. Over the main entrance there is a tower supporting a bracket clock, and containing in the belfry a heavy peal of bells, intended to act as the chimes and hour bell of the clock. To describe in detail the various class buildings would pass beyond our space limit; but it may be said, briefly, that the Institute is most complete, structurally, and essentially up to date and thorough in its equipments. The trade departments embraced in the educational section are fully representative, and the great facilities for study will no doubt be an inestimable boon to the student whether his subject be painting and decorating, drawing, building construction, plastering, wood carving, engineering, or the score of other subjects comprising the curriculum. The Institute has been very efficiently staffed, with Mr. E. Mollineux Walmsley, D.Sc., F.R.S.E., principal. Exclusive of the site given by the late Marquis of Northampton, and valued at from £25,000 to £30,000, the cost of the building has been £80,000, with about £12,000 further for furnishing and equipment. The building contract has been in the hands of Mr. W. Wallis, of Balham.

A PROPOSAL is on foot to fill one of the windows in the Winchester Cathedral with stained glass to the memory of Jane Austen, whose remains are interred in the cathedral.

The Church of St. Aidan, at Shobnall, Burton, has just been consecrated. The church was erected ten years ago, but the consecration could not take place earlier, as it was built on leasehold ground, by Messrs. Maw, Crossman, and Paulin, at a cost of £3000.

R.I.B.A.

THE PRIZES AND STUDENTSHIPS,
1898-99.

THE pamphlet giving particulars of the Institute prizes and studentships for 1898-99 is issued to members with the current number of the Journal. There is an important change in the conditions of one Studentship to which it is desirable that special attention should be directed. For some years the "Owen Jones Fund" has been increasing, and lately it has benefited under Owen Jones's will by the death of an annuitant—Hannah Jane Jones. It has therefore been decided by the Council that the Owen Jones Studentship should be £100 in value, and that the tour of the student should be of not less than six months' duration. Certain modifications have also been made in the regulations for the "Arthur Cates" Prize.

The following is a brief summary of the subjects set and the general conditions:—

THE ESSAY MEDAL AND TWENTY-FIVE GUINEAS, open to British subjects under forty years of age.—Subject: "The Use and Value of Colour in Architecture."

THE MEASURED DRAWINGS MEDAL AND TEN GUINEAS, open to British subjects under the age of thirty.—Competitors must submit their own measured drawings of any important building, classical or mediæval, in the United Kingdom or abroad.

THE SOANE MEDALLION AND £100, open to British subjects under the age of thirty.—Subject: Design for a Concert Hall to seat 2500 persons.

THE PUGIN STUDENTSHIP (Silver Medal and £40), open to members of the Profession (of all countries) between the ages of eighteen and twenty-five.—Awarded to the candidate who submits the best selection of drawings (by preference measured drawings of Mediæval Buildings) and testimonials.

THE GODWIN BURSARY (Silver Medal and £40), open to members of the Profession without limit of age.—The object of the Bursary is to encourage the study of works of modern Architecture abroad, and candidates must submit selections of practical working drawings, or other evidence of special practical knowledge, and testimonials. The knowledge of at least one foreign language is a necessary qualification.

THE OWEN JONES STUDENTSHIP (Certificate and £100), open to members of the profession under the age of thirty-five. Candidates must submit testimonials with drawings, some of which must be from existing buildings, and other examples exhibiting their acquaintance with colour decoration and with the leading subjects treated of in Owen Jones's "Grammar of Ornament."

THE TITE PRIZE (Certificate and £40), open to members of the profession under the age of thirty. Subject: A Royal Mausoleum, not exceeding 12,000ft. in area.

THE GRISSELL PRIZE (Gold Medal and ten guineas), open to British subjects who have not been in professional practice for more than ten years.—Subject: A Fruit, Flower and Vegetable market for a small provincial town, on any open site of 100ft. square. The market to be covered with iron and glass; roof supported on iron columns.

THE ASHPITEL PRIZE (Books to value of ten guineas), awarded to the student who most highly distinguishes himself in the Final Examinations, 1898.

THE ARTHUR CATES PRIZE (Books to value of ten guineas).—This prize will be given by Mr. Arthur Cates at each Final Examination, until further notice, to the student (successful in passing the examination) whose testimonies of study, together with certain specially prepared sheets of drawings, are considered by the board best to merit the prize.

MESSRS. FREDERICK GOODALL, W. W. Oulless, J. S. Sargent, and Ernest Crofts are the artists to whom the hanging of the pictures in the Academy Exhibition of 1898 has been entrusted.

Professional Items.

ARMLEY.—A new Methodist chapel in Hall Lane, Armley, has just been opened. The total cost of the chapel and the adjoining Sunday school is estimated at £3850. The style of Architecture is a plain treatment of Gothic. The chief external features are a tracery window in the front gable and a square tower with an octagonal spire. The inside of the chapel consists of nave and side aisles. It is 52ft. long by 39ft. wide. A deep recess behind the pulpit forms the organ and choir chamber. A clerestory runs the whole length of the nave, supported by ornamental iron columns and wrought-iron stanchions, filled with wood framing and leaded lights. Between the columns are plastered, moulded arches. The woodwork is of yellow pine, varnished. The building is admirably lighted by windows glazed in diamond and square leaded lights. The pulpit and communion railings are of English oak. The chapel provides accommodation for 410 persons. The school, situated behind the chapel, consists of a central hall, 52ft. long by 28ft. wide, out of which five class-rooms open. The minister's vestry, a caretaker's house, &c., are placed between the chapel and the school. The architect is Mr. W. S. Braithwaite, of South Parade, Leeds, and the work has been carried out by the following contractors:—Mr. W. Lolley (brick and mason work), Mr. J. Taylor (carpenter and joiner), Messrs. W. and C. Barrand (plumbers and glaziers), Mr. J. D. Dakin (plasterer), Messrs. J. Atkinson and Son (slaters), Messrs. Newsom, Roberts, and Co. (heating), and Mr. H. Smith (painting).

BRADFORD.—The restoration works at Bradford Parish Church are progressing satisfactorily. The removal of the organ from the Leventhorpe chapel, and the clearing away of a wooden partition which blocked the arch between that chapel and the north aisle, has opened up a really pretty and unexpected vista across the church from the south door, the chapel itself being of some interest by its possession of a square-headed window unique in the building. The destruction of the vestry adjoining the Leventhorpe chapel has opened to view an ancient hagioscope or "squinch," affording a view of the high altar through the wall from an upper chamber which must have existed in the ancient vestry. As this will necessarily be concealed by the new vestries which are to be erected, archaeologists should take an early opportunity of seeing it. The Restoration Committee have decided that the internal walls should be left free from plaster, and the Bishop is said to have expressed approval of that course. The removal of the old plaster has already been very largely carried out. In the process several interesting mason's marks and some old black letter inscriptions and decorative scroll-work have been discovered. The inscriptions, which are in all likelihood of post-Reformation date, since they are in English, are painted in fresco on the wall roughly levelled up with plaster, but they will necessarily be removed with the plaster. They are, however, in a very fragmentary condition. Under the plaster over the chancel arch there is known to be an ancient painting of a figure in coloured drapery, but when this was uncovered a generation ago, at the restoration works then carried out, it was decided to be of so fragmentary a character as not to be worth preservation, and it was again covered with whitewash. This will also, of course, finally disappear with the removal of the plaster. The stone-work inside, though far from being entitled to the term ashlar, has been found not so rough as was expected, and when pointed and in a few places renewed, it will give the neat finish which is the desire of the modern restorer. Externally the work of disinterment and reinterment is concluded, and the foundations of the new north transept are now in. The south transept will also be speedily put in hand.

CARDIFF.—A new Baptist school-chapel has been opened in Albany Road. Designed by Messrs. Habershon and Fawckner, of Cardiff,

and erected by Messrs. E. R. Evans Brothers, builders, of the same town, at a contract price of £2300, the building consists of a large school-room, ten class-rooms, an infants' room, and a vestry hall, and is so designed as to serve also as a place of worship pending the erection of a permanent church building immediately adjoining. The structure, which is in the Renaissance style of Architecture, is built of Newbridge stone, with Bath stone dressings, and the front elevation faces Blenheim Road, and is carried up with three gables.

DUNDEE.—Negotiations have been in progress for some time past, and are now all but completed, having in view the construction of an arcade of shops and business premises in a central locality in Dundee. The project is to run a covered thoroughfare from the east side of Albert Square to Murray Gate, in a line almost parallel with Commercial Street, and with this object its promoters have purchased property for £10,000. The intention is to reconstruct the Albert Square frontage upon a more pretentious and elegant scale, providing a large and suitable entrance to the arcade within.

FALMOUTH.—In the course of its existence of 236 years, Falmouth Parish Church has undergone considerable alteration. The site originally stood between Arwenack and the village of Smithick, but the growth of Falmouth surrounded it with houses, and now the church is in the heart of a populous district. Erected as a memorial to King Charles the Martyr, the church is one of considerable interest, and its connection with the rector's rate gives it an unique position. The middle of the building was first erected, additions being made to the east and west as the congregation increased. This accounts for the peculiar arrangement of the columns, which were set at uneven distances. Previous to the present work of restoration the nave was divided from the aisles by four columns, composed of granite. They were of an unusual character, the granite being surmounted by Ionic capitals in plaster. Recent alterations have not caused any change in the ground plan, except the re-arrangement of the columns, so that the spaces between them are now equal. Formerly uneven, the entablature now runs uniformly right through the building. Two of the columns in the restored building are of marble, with alabaster caps, and mark the line of the new chancel, according to the eastern extension scheme of the architect. Lack of funds prevents the completion of this work at present, but when accomplished it will add much of symmetry to the appearance of the interior. In view of future extension a temporary window has been placed where the chancel is designed to be carried out. The removal of the old side galleries has greatly improved the look of the building. With an ornamental front of teak wood the west gallery is retained. The nave was covered by a low segmental ceiling, and the aisles had sloping ceilings. Now there are new semi-circular ceilings, divided by arches, and encircled with plaster work in a design of flowers and birds. Vaulting lines add to the artistic character of the ceilings, and from the intersections hang long gas pendants. The building has been heightened more than 3ft. A completely new and secure roof has been placed on the church. The dilapidated condition of the old roof was really a menace. All the floor has been concreted and covered with wood blocks, save the pavements in the nave and aisles, which consist of Portland stone and slate. A large number of vaults in the floor have been filled up. New seats of a more comfortable and substantial character have been put in. They are mostly of stained red deal, with moulded ends. In the nave the ends are of moulded oak. Over a thousand people can be provided with sitting accommodation. When the work of restoration was commenced there was a doubt as to the safety of the walls, but they proved to be quite sound. It is estimated that the total cost of the work will be nearly £3000.

GLOUCESTER.—The locally historic building, Ribston Hall, has been put into habitable

repair, and will be used as a sanatorium. The building is of a most solid and commodious character, and has been completely renovated, redecorated, and furnished throughout. The house is four stories high, there are thirty rooms, and baths on every floor. There is an extensive library and a lecture hall large enough to accommodate nearly 200 persons. The sanatorium is intended to give the advantages of hydropathic treatment. The drainage and sanitary arrangements have been remodelled on the latest and most improved principles.

GREAT MASSINGHAM.—A new reredos has been erected in the parish church. It is in the form of a triptych, the central panel being a conventional representation of the Crucifixion, the panel on the left that of the Blessed Virgin, and that on the right of St. John the Divine. The panels were painted by Mr. C. F. M. Cleverley, and the frame under his supervision by Messrs. Powell, of Lincoln and London. The carving is by Mr. A. L. Turner, of London, from the designs of Mr. S. P. Warren, architect.

HARROGATE.—The foundation stone of the Church of St. Mark, at Harrogate, has been laid. The new church will occupy a commanding position by the side of the Leeds Road, close upon the borders of Harrogate. It has been designed by Mr. J. O. Scott, of London (diocesan architect), and will cost, without the tower, something like £12,000. It will be in the English Decorated style of Architecture. For the present only the nave, north and south aisles, and chancel will be completed; but it is hoped, within a short time, to add a tower of magnificent proportions at the west end. The nave will be 25ft. wide and about 90ft. long, and the total width of the aisles and nave will be 54ft. The feature of this portion of the building will be a fine clerestory, from which the greater part of the light will be obtained. The aisle windows, which are comparatively small, will eventually be filled with stained glass. The width of the chancel will be 23ft., and its length 38ft.; it will be lighted by two windows on either side, and a very fine east window of five lights. On the south side of the chancel will be a chapel with seating accommodation, access to which will be obtained through an arch. A corresponding arch on the north side will lead to the organ chamber. Vestry accommodation will be provided beyond the chapel. At the eastern end of the nave there will be entrances north and south, with a larger entrance to the west of the nave, and another at the west end of the church. The tower will be 105ft. high to the battlements, and owing to the elevated character of the site, will be visible for miles round. The roofs throughout will be of pitch pine, and it is intended to face the walls with stone, and to provide oak seats, choir stalls, and fittings. The main ventilation will be provided for by means of a large shaft, carried up to the top of the tower, and there will also be outlets in the clerestory and other windows, with suitable inlets for fresh air. The flowing tracery of the windows will be one of the features of the church. The building will be heated by hot-water pipes, and will be lighted by electricity.

LAUNCESTON.—The block of buildings intended for the new premises of the Launceston Liberal Association are rapidly approaching completion. Mr. Otho B. Peter is the architect, and Messrs. Broad and Werren, of Launceston, the builders. The demolition of the buildings occupying the site of the proposed Free Library will be commenced almost immediately.

LEEDS.—St. Chad's Mission Church, Hunslet, has just been opened. The preparation of the plans was intrusted to Mr. J. E. Leak, and the contract was let to Messrs. George Oakes and Sons. The building, which is of red brick, comprises two floors. On the basement is a spacious schoolroom, which will also be available for parochial purposes, and on the floor above is the church, which seats about 300

people. The entire cost, including furnishing, is £1300.

The new headquarters of the Volunteer Medical Staff Corps were opened by the Lord Mayor recently. The new premises situate in St. James Street consist of a drill hall, staff offices, orderly offices, clothing stores, and residence for staff-sergeant, with the rear portion of the site reserved for the erection of a model hospital in the near future. The new buildings have been erected from plans prepared by Mr. William Bakewell, Leeds.

LIVERPOOL.—The foundation stone of a new church institute and parochial hall at Prince's Park has been laid. The new building, which it is estimated will cost £3200, will be of a useful type, and, besides a complete suite of class-rooms, will comprise a large hall capable of holding 400 people, another hall which can be adapted for the purposes of a gymnasium and recreation-room, and other rooms and offices. In the church the old staircase leading to the pulpit has been removed, and an entirely new staircase of elegant design has been substituted. The work, chiefly of wrought-iron, has been carried out by Messrs. Worrall and Co., Byrom Street, under the supervision of the architects, Messrs. Willink and Thicknesse.

NEWPORT.—The Newport School Board Offices and Pupil Teachers' Centre, which have been erected, occupy a site next to the Charles Street Baptist Chapel. The front block, which consists of the offices of the Board, is a lofty four-storied building, having a frontage of about 60ft. to Charles Street, and with an elevation of red local pressed brick and red Mansfield stone, designed in a free treatment of English Renaissance. The buildings are provided with fireproof floors on the "Fawcett" principle, the school floors being finished with deal blocks, and the entrance hall and corridors in offices with Venetian *in situ* mosaic. Heating and ventilation have received special attention. The premises are lit by electricity. The contractors for the electric installation were Messrs. A. G. Arnold and Co., of Newport. Mr. J. Linton was the contractor for the buildings, the amount being £5000, exclusive of furnishing. The premises have been erected to the designs and under the superintendence of Messrs. Conyers, Kirby and Son, of Newport.

PORT ERROLL (Scotland).—The new hotel being erected at Port Erroll occupies a commanding site about half a mile from the railway station, and affords an extensive view of the sea and the surrounding country. It is designed in the baronial style of Architecture, and built throughout of red Peterhead granite, with Kemnay granite dressings. It consists of a large centre block of five stories, with two projecting wings at the back. The front elevation, which faces the south, extends to 118ft. in length, and presents a massive appearance. Up to the ground floor it is built of rustic ashlar, and the walls above of square snecked ashlar, with three moulded spring courses and block and space eave-course, crow-step gables, and stone dormer windows. Over the two main gables in front are two square windows set out upon moulded corbels. The distinguishing feature is a handsome tower, 98ft. high, having an embattled front, and flanked on each side with turrets. On each side of the tower, and at the ends of the front elevation, are large gabled wings, some 60ft. high, and, projecting from the face of these, are, as already stated, large bay windows, carried up two stories, and possessing handsome parapet copings. The principal entrance is under the tower, in the centre of the building. It is of ample proportions, being in the form of a semi-circular arch, 8½ft. in width, with mouldings cut in granite, and having polished pillars at the sides with Corinthian caps.

WARRINGTON.—The foundation-stone of the new Workhouse Infirmary at Warrington has been laid. The new infirmary, which is in close proximity to the workhouse, will have accommodation for 200 beds. The contractor is Mr. Davenport, of Stockton Heath, and the architect Mr. William Owen.

Under Discussion.

NEW BUILDINGS IN THE CITY.

Recently the Goldsmiths' Institute Building and Architectural Society paid a visit to a block of buildings being erected on the site of 77 and 78, Gracechurch Street, E.C. The elevation is executed in Portland stone, and designed so as to give breadth to the premises and to provide ample light to the interior. The construction throughout is fire-proof, the floors being coke-breeze cement carried by rolled steel joists and girders, which are carried by cast-iron columns and stanchions; the stairs are of patent stone, manufactured by the Impervious Stone Company, of Victoria Street. The premises are planned so as to be suitable for a bank or insurance offices, and it is intended to line the walls on the ground floor with faience. The work is being carried out under the superintendence of Mr. H. C. Clarke, the architect of Kensington Gardens Square, W. The visit terminated by passing a vote of thanks to Mr. Batchelor for conducting the party over the premises, and to Mr. Clarke for permission to view.

SIXTY YEARS OF ARCHITECTURE.

Mr. George T. Hill, in a paper entitled "Sixty Years of Architecture," read before the Glasgow Architectural Society, reviewed the phases during the Queen's reign. Speaking of the "Battle of the Styles" which raged for many years between the Classicists and Gothicists, he noted as peculiar that although Barry, a Classicist, won the Parliament House, he was forced to design it in the Gothic style, even the exact period being laid down, and although Scott, a most confirmed Gothicist, gained the Foreign Office with a Gothic design, he was compelled by Lord Palmerston to carry it out in the Classic manner. Five sketch books of Scott's contain an itinerary of his travels, without the faintest indication that he had seen anything but his favourite period of Gothic. Glasgow University was referred to as showing how suitably this architect could adapt his Gothic. Architectural journalism came into being during this reign, and in London's first professional paper, *Ruskin* wrote his early articles, sending a ray of light through the dull pedantry of the stylists. The lecturer closed by referring to improvements in draughtsmanship, with its good and evil results.

DUBLIN MASTER BUILDERS.

The annual dinner of the Dublin Master Builders' Association took place recently at Dublin. The Right Hon. Joseph M. Meade, P.C., LL.D., President of the Association, occupied the chair.—Alderman Pile (High Sheriff) submitted "The Master Builders' Association."—The President responded. He said the Association existed for the good not only for the master builders, but of their workmen. Every member of the Association expected from his workmen a fair day's work, and for that he was ready to give the full wages of the district. In dealing with the architects, they dealt with men whose knowledge of their business and whose integrity were equal to those of the members of any similar association. They had been met by the architects in the kindest way, which was in the interest of the public. As to the past year, they had no difficulties neither with their men nor with the architects.—The President proposed the "Royal Institute of Architects of Ireland and the Architectural Association of Ireland." In no city in the Empire might this toast be proposed with more appropriateness than in Dublin, for in this city and in this country they had evidence and proof of the skill and ability of the architects of old. In the city itself were two fine old cathedrals, built some centuries since, and which were monuments of what the architects of the time could do in the way of design, and the builders of the time in putting their designs into execution. In the last century some magnificent buildings were erected in Dublin, and they were splendid creations of

those days, but, to come down to the present day, they had nothing to be ashamed of. Within the last fifty years, churches, banks, private dwellings, and buildings of all classes were worthy to rank with the creations of their forefathers. The work of the architects of the present day differed from that of the past. The time had gone by when an architect might sit down and apply himself exclusively for years to one work.—Mr. W. M. Mitchell, in responding, said that but for their friends the contractors their skill, their organising power, and their appliances, it would be impossible to accomplish the great works of the present day, such as were carried out in Dublin, Belfast, Cork, and other places. He was glad to say that the architects of Ireland would soon have a home of their own in Dublin, and would have an educational curriculum worthy of the body.—Mr. Kaye Parry also responded. He said he believed the architects of Ireland had no reason to be ashamed of the position they held collectively as an institute compared with that of their brethren in England. He was not speaking of architectural works, but he believed that in no town in the United Kingdom were there architects more anxious to co-operate with each other for the benefit of the Profession than the architects of Ireland. He believed that successful results could only be achieved by friendly co-operation between the architects and builders.—Mr. R. C. Orpen also responded.

THE LANGUAGE OF LINE.

The "Language of Line" formed the subject of an address given recently by Mr. Walter Crane at the Women's Institute, Grosvenor Crescent. Mr. Crane commenced by pointing out that all were influenced by the scenes that surrounded them, and that certain continually recurring impressions left their mark. Certain lines were associated with beauty, with movement, or with other ideas, till they could almost be relied upon as a medium of speech. Line might be regarded as a symbolic language in place of speech or writing, and then evolved into either the arbitrary characters of writing, or into emblematic or allegorical art. Line might be strictly decorative like silent music, or graphic, a means for the delineation of character, of the facts of Nature, and a faithful chronicle of life and history. Mr. Crane then proceeded to show, by means of sketches, lines representing various ideas, such as the straight line for the sea, the curve for the sun rising out of it, the waving lines for water and fire, and other primitive emblems. These were all used as patterns, and were one of the great sources of ornament. Writing might be considered as a kind of degraded drawing; the arbitrary letters were derived from original hieroglyphics. Relics of this primitive art could be seen in children's drawings, and the primitive citizen, of whom Mr. Crane made a sketch with simple lines for the arms and legs, decorated many of our walls and doors. As long as the image satisfied the dramatic instinct, the child required no further details, and the indelibility of the linear language was shown by the impression made on the childish mind by pictures. He then went on to show how the idea of repose was associated with the straight line, the idea of movement with the curve, and to explain the importance of controlling boundaries to the designer, and the methods used by the draughtsman to express certain textures and surfaces. The actual handwriting of former days as seen in the beautiful Italian copy books showed how nearly the calligraphers' art touched drawing, and in this way, which had now gone out of use, writing might be made a useful half-way house to drawing. In the present day there was little danger of the Art of the draughtsman declining; and he would suggest at a time when newspapers were so largely illustrated, that some paper might dispense with the reporter, and trust entirely to the artist.

Mr. S. E. BURGESS, borough engineer, Stoke Newington, has obtained the appointment of borough surveyor to the South Shields Town Council.

Correspondence.

BULLETS IN CHURCH DOORS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—In reference to your note in the current issue of the BUILDERS' JOURNAL regarding the discovery of bullets in the oak doors of St. Clement Danes, it may be of interest to your readers to know that I have found exactly the same thing in the Church of St. Mary-the-Virgin, Aldermanbury, E.C., which is now being redecorated. In this case the original oak doors had been covered over at some time with deal casing, and on the removal of this and the numerous coats of paint with which the oak itself had been treated, quite a large number of shot were found embedded in the oak. The church, as your readers will be aware, is one of Wren's, and dates from 1675; and no doubt these doors are the original ones.—I am, dear Sir, your obedient servant.

Mar. 18th. LEWIS E. G. COLLINS.

"THE DORKING 'FOUL'."

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Having seen the leader in your issue of the 16th inst., headed "The Dorking 'Foul,'" if the statements made are correct, I think the time has now come for the Profession to try and put a stop to this underneath work, which is growing more frequent in architectural competitions. It is scandalous that any committee should behave in so underneath a manner.

If the Dorking Guardians wanted a "nice pretty" building, and also said that they were not considering the health of the patients to be placed therein, and also that they should not consider how the plans were arranged, the competitors would then know how to deal with such a matter, and not spend many hours of hard work on plans that were to be thrown on one side and never be looked at by the appointed assessor.

I am surprised at any assessor even passing his opinion when he had not seen the whole of the designs submitted. I, as one of the unsuccessful competitors, do not intend to submit to such treatment if there be any way of getting justice, and shall be pleased to join others who have been so misled, to bring this forward as a test case.

I remain, yours truly,
"JUSTICE."

THE R.I.B.A. prize competition drawings, consisting of nineteen strainers and fifteen testimonies of study, were exhibited at the City Fine Art Galleries, York, last week. Mr. Geo. Kirby, curator, was in charge of the drawings, and the exhibition was organized under the auspices of the York Architectural Society.

It is stated that the Government has secured a plot of land, to the extent of 5½ acres, in Kensington, near Olympia, on which they propose to erect buildings for the use of the Savings Bank Department of the General Post Office. It is anticipated that two or three years will be required to erect suitable buildings on the acquired site.

THE Stevenson shrine at Swanston Cottage, near Edinburgh, which was the novelist's home for several years, has been rendered additionally interesting by the discovery of a curious tree carving. The date of this little memorial of Stevenson, on an old tree beside the cottage which nestles at the base of Kirkcubright, is 1874, so that he would at that time be 24 years of age.

It would be a difficult matter to find a church in a more deplorable condition, from a structural point of view, than St. Barnabas, King Square, Goswell Road. No substantial renewal has taken place since 1860, and matters have reached such a pass that there is every likelihood of the building falling. It has been estimated that £1760 will be required to carry out necessary repairs.

Enquiry Department.

ROOF CONSTRUCTION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Could you kindly inform me through your Enquiry column the cheapest way, consistent with a good and sound construction, of forming a roof and ceiling under the following circumstances, viz.:—The roof springs from walls 12ft. 9in. high from the floor-line, but the ceiling can only be 10ft.

above the floor. The centre wall, shown in the diagram accompanying, cannot possibly be carried up any higher for good reasons. Can you also tell me what the scantlings of the different timbers of the roof and ceiling should be, and what kind of roof is best?—I am, dear Sir, yours faithfully,

"PUZZLED."

We think a king-post truss roof would be the best under the circumstances mentioned, as shown in the accompanying drawings. If sound red fir is used, suitable scantlings would be—tie beam 9in. by 4½in.; principal rafters, 5in. by 4½in.; king-post out of 4½in. by 7in.; braces, 4½in. by 3in.; ridge board, 9in. by 1½in.; purlins, 8in. by 4½in.; pole plate, 8in. by 3in.; rafters, 4in. by 2in. If white fir is used, an extra ½in. in thickness will be required. The ceiling can best be arranged by fixing 2in. by 2½in. ceiling joists, 14in. apart, to 6in. by 2½in. bearers, fixed 4ft. apart as shown, to wall-plates 4½in. by 2½in. The

plates can rest either upon 3in. by ½in. W. I. straps, as shown in Fig. 2, or upon bricks corbelled out 2½in. every 3ft., or if the walls are already up, suspend the bearers from the tie beams by 4½in. by 3in. pieces halved and spiked thereto. (See right side of Fig. 1.) Spruce will do for the ceiling timbers. If the former method is adopted it would be as well to drive in a temporary strut at each end between bearer and tie beam whilst ceiling joists are nailed up, to prevent the bearer lifting. They could eventually be knocked away.

TENDENCIES IN ART.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Can you give me a list of the works of modern architects (for about the last thirty-five years) in and around London, which are worthy of study as examples to the tendency of Art at present and of the evolution of such tendency?—Faithfully yours,

Lewisham.

"DESIGN."

A list such as you ask for is not easy to supply. To fully understand any such tendency as this, it is surely necessary to take into account every individual example, for, whether good or bad as works of Art, they have all equal value from an historical or scientific view, as illustrating a certain tendency in human affairs, as providing data from which to generalise. The difficulty always is—particularly with regard to contemporary affairs—to say which is the main stream of tendency, and which are backwaters leading nowhere, through which no further progress is possible. It is a question also, with some people, whether during the last thirty-five years there has been any tendency at all, in any definite direction; whether we are not outside the main stream altogether, and are simply whirling round in an eddy and making no progress; whether the most careful analysis and comparison of the buildings erected during this period, would show any quality common to all, which would mark them all out as being the outcome of any particular tendency of human thought. By asking for examples of the tendency of Art, you narrow the scope of the enquiry, and put out of court the immense mass of building which is not Art. But the difficulty is to draw the line, and it is not our province to pronounce, *ex cathedra*, on this question. We take it, however, that the broadest test of Art is sincerity. It is a flag under which we may all range ourselves. If a man builds in a certain way because he believes it to be the best way, because he has convictions, his work—however poor or mistaken it may be—has at least the merit and charm of sincerity. Doubtless such work is of the greater importance to the enquirer, whether critic or student. Without any wish to be invidious, we might mention some of the buildings in London which we think every artist will admit to be the outcome of sincere convictions, and an honest attempt to do the best, and which ought not to be overlooked in any such inquiry as you propose:—Private house in Melbury Road: W. Burgess. St. Mary Magdalen, Paddington, and Law Courts: G. E. Street. St. Augustine, Kilburn, and Church, Red Lion Square: J. L. Pearson. Church in Sloane Street and church at Clerkenwell: J. D. Sedding. St. Agnes, Kennington: Geo. G. Scott. Church in Spanish Place: Leonard Stokes. New Scotland Yard; Insurance Offices, St. James' Street; Barings, Bishopsgate Street; Houses, Queen's Gate; Lowther Lodge, Kensington; Houses at Frognal, Hampstead: R. Norman Shaw. Lodges, Regent's Park; Nesfield. Houses at Kensington and Chelsea: Philip Webb. Bank, Ludgate Hill; Bechstein's, Wigmore Street; P. and O. Offices, Leadenhall Street; King's Hall, Holborn: T. E. Collcutt. Chelsea Town Hall and Polytechnic: J. M. Brydon. Conventual buildings at Hammersmith: Bentley. This list is by no means complete. There is, for example, a chapel somewhere Clapham or Wandsworth way, by Philip Webb. Perhaps some reader could give us the name and exact locality, and whether access can be obtained to it, as we understand it is of peculiar interest.

THE sum of £2500 has already been subscribed towards the cost of the memorial which is to be established in Birkenhead to the late Mr. John Laird. The memorial is to consist of a bust, to be placed in the Birkenhead Town Hall. Leading sculptors will be invited to communicate with the committee at the Town Hall, and as soon as the contract for this work has been settled, the distribution of the available balance will be determined.

Trade and Craft.

TILING AT THE BIRKBECK BANK CHAMBERS.

In referring last week to the tiling and terracotta work which has been carried out at the Birkbeck Bank Buildings, we should have credited Messrs. Doulton and Co. with having also been largely responsible for the work. This tiling—which has been much admired—has been executed, in part, by Messrs. Doulton and, in part, by Messrs. T. and R. Boote, Limited; and, in identifying the latter firm with the work, the name of Doulton should not be omitted.

A NEW DECORATIVE MATERIAL.

The "wise man" who observed that of the making of many books there was no end, would, most likely, if he had lived in this age, have made the same remark about wall decorations. The other day (writes a correspondent) I really came across something quite new. The material has the appearance of tile—but it is not tile, for if it be placed in such a light that the angle of the rays prevents you from seeing the picture or design upon a tiled surface, the new material shows up just as if the light was adjusted to its convenience. Paper it certainly is not, for you cannot tear it or make the least impression upon it. It is just glass—opaque glass—painted with enamel colours, and with the colours and the glass fused together with intense heat. There is also a backing of cement, nearly an inch thick, which gives great strength and solidity to the whole. The surface, however, is the great thing, for there is a matt, or eggshell, surface, which produces the effect to which I have referred as superior to the glazed effect of tiling as a wall decoration. It is scarcely necessary to observe that the stuff is patent. I saw several designs at the studios of the patentees, Messrs. Kayll and Co., artists in stained glass, Albion Street, Leeds, and I can testify that "Pictus Sertus," as it is called, is a very effective decoration, and well suited for friezes, panellings, &c. Some of the designs were singularly effective, and the colouring admirably maintained.

TENDERS.

AUDENSHAW.—For laying an intercepting sewer from Station-road to a point between Ashton Hill-lane and the Canal, for the District Council. Mr. J. H. Burton, surveyor, 2, Guide-lane, Hooley Hill:—

An Architectural Causerie.

Cosmopolitanism in Art.

ON several occasions lately there has appeared in the Press a rumour to the effect that certain well-known artists are contemplating the establishment in London of a cosmopolitan Art exhibition, where may be seen, year by year, the best productions of foreign countries. It is to be hoped that this rumour is true, and that, should it ever be carried out, a proper regard will be paid to the claims of Architecture. An exhibition, by means of which English architects could keep in touch with what is going on in other countries, would have a great educational value. As it is, the occasional publication of a foreign design in the professional journals is about the only source of information for the great majority of us. It is to be feared that we are too insular—too provincial, as Mathew Arnold might say—not enough in the centre of things, and the worst of it is that some of us boast of it. How little do we know, and how little do we care about, what is being done by our contemporaries in other countries, compared with the interest that other artists take in the work of their foreign comrades? It is to our advantage to make ourselves acquainted with the best, and it stands to reason that all of this best cannot be produced here. It might be as well not to enquire too closely how much or how little: the result might not be flattering to our national vanity. There ought to be some organised method of keeping the best of foreign work always before us, and not only foreign work, but foreign ideas and opinions. A little candid foreign criticism, too, on our own performances might not do us any harm; it might make some of us open our eyes. Why have we not correspondents in all the foreign Art centres to keep us informed as to the latest tendency, the newest idea; to give us an insight into other ways of looking at things, other habits of thought? We are apt to attach too much importance to local and national characteristics, to accentuate the points of difference rather than the points of agreement, perhaps because they are easier to see. We want more sympathy and mutual agreement between the artists of various countries. Differences of climate and material will always provide us with local characteristics; there is no need to wilfully accentuate them. The time has gone by for different nations to pride themselves on their peculiarities and little eccentricities, and sneer at the rest of the world as "only foreigners." Facilities of communication and travel are rapidly bringing all civilized peoples into one general confederation of manners and morals; local peculiarities are fast disappearing. The points of agreement between the educated and travelled gentlemen of the different nations of Europe are far greater than the points of difference. These may involve some loss of the picturesque, but if it tends to a general advance towards a higher level we cannot very well regret it. It is probable that if our Architecture had more in common with that of foreign countries, it would more

truly express the tastes and ideas of the more cultivated men among us—because of their cosmopolitan education. Each man for himself, each nation for itself, may be a practical motto for practical affairs, but it is no good in Art. What we want is a confederacy of the artists of every nation and tongue for the advancement of Art. A. R. J.

Prometheus Discovered!

THE discovery of Prometheus is reported! The interesting intelligence was brought to light within the past few days, in a paper read before the Royal Geographical Society by Mr. Richard Mitchell, who returned to England a few months ago, after a tour through Asiatic Russia. The story told by Mr. Mitchell—than whom, we are told, no traveller is held to be more reliable—is astounding. It was whilst surveying the eastern side of Mount Caucasus that the traveller saw through his telescope what appeared to be a naked figure on a rock near

noticed that his body was covered with scars, but at first I was not sure whether he was alive or dead. I shouted and waved my knapsack in the air. The captive turned his head in my direction, thus enabling me to get a full view of his face, which was that of a young man, though horribly drawn, emaciated and rigid with exposure. His hair hung down over his shoulders like a mantle, and it was weighted with long icicles. I shouted again. The captive uttered a faint moan. I could see the tears stream down his cheeks, freezing as they fell. He seemed to be trying to speak, but at that moment my attention was distracted to an enormous golden eagle—larger than any I have ever seen—which had appeared in the sky and was wheeling slowly over the summit. In a few moments the creature swooped down and began tearing at the wretched man's body. The sight sickened me so that I had to turn my head away, cursing my impotence to interfere. When I looked again the bird was already soaring high in the air. In the failing light I could see that the captive had fainted and

PROMETHEUS.

BY O. WHEATLEY.

the mountain's summit. Mr. Mitchell communicated his strange telescopic discovery to the innkeeper when he reached Tzeva, a village in the valley; and, on being pressed, his host said the figure must have been that of the white captive. From the peasants in the district Mr. Mitchell learnt that the figure had been there for many years—in fact, they thought it had been there since the days of the Creation. Mr. Mitchell determined to ascend Mount Caucasus, but his appeal to the neighbouring peasants to accompany him only brought out their superstitious awe. Mr. Mitchell went alone, eventually reaching a point about 300ft. below the mountain's summit, near where he had first seen the curious figure. Says Mr. Mitchell:—"The sun was low in the West, but I could see clearly what was indeed a naked man chained by the wrists and ankles to an upstanding rock. I

that blood was flowing from a long wound in his side." A pretty story!—but that it is fictitious, or the result of an illusion, such as trouble men in very high altitudes, are theories which are rigorously held to be untenable, and the only question is the identification of the strange captive on Mount Caucasus with Prometheus. We know that Prometheus, by order of Jupiter, was chained to a rock at the summit of this mountain; that his punishment was to last for 30,000 years; that on every day during this period he was to be preyed upon by Jupiter's own bird. But against this it is contended that Prometheus was rescued by Hercules thirty years after sentence was passed, a theory which in turn is disputed. Many writers since the Middle Ages have put forward the theory that the gods of Greece and Rome are not dead, and now is announced the discovery of Prometheus! H. C.

The "Wayfarer" on Architecture.

It is generally admitted, by the wise men of this age, that growing old has its drawbacks, but here are—so the "Wayfarer" thinks—compensations. "Things we pass over carelessly in youth" he says, "you learn to appreciate in some way or another, wholly or in part, that were previously ignored as being of no importance. . . . In the first reading of some great novelist, descriptive passages are missed, this or that overlooked, in the hurry to arrive at the winding-up of the tale; there is a scampering through the pages in order to learn whether the hero and heroine lived happy ever afterwards, or if Bloodstained Bill was hung for his crimes, or married the Indian maiden named Sierwatha. . . . It is somewhat the same in the appreciation of fine Architecture. On the first visit to a cathedral, you stroll round in a casual and superior sort of way, and out through the western porch, with the idea of having 'done' the building. . . . A year or two passes, a gray hair or so finds its way among your fair locks, and then another journey is paid to the building. A revelation comes this time with surprising force; beauties hitherto hidden show themselves, the march round is more leisurely, the eye dwells with something of joy upon the long shafts, the pointed arches, and the wonderful proportions; the picture is seen as beauty for its own sake, certain impressions remain enabling you to call up the scene at your pleasure. If of a retrospective nature you will wonder why you don't worry about the time of the train's departure as on the first occasion. It is the passing of the years, life is seen less frantically, animate and inanimate things close, and at hand are regarded with a more favourable gaze. In youth you move too quickly to appreciate the beauties; your vision is ahead. . . . Three or four years pass, perhaps, before you again travel in that direction, the grey hairs have multiplied in number, you are also subject to slight attacks of lumbago, but the building continues to unfold wonders. To beauty of proportion, to pleasant curves and sturdy masses, is added a new joy—a sense of intimacy with the men who wrought and placed the stones and carved the foliage; it sets the mind roving back to the times and people who raised the structure—from then forward it becomes to you a record—a fragment of past life told with symbols on stone, metal, and wood. From the ugly devil that forms a gargoyle and the saint of ascetic mien over the western portals, to the plain and fretted stonework, springs a tale of the days gone by—they are links in the chain that connects the past with the present, and prevents you from feeling lonely as you run the course. "Architecture," shouts the "Wayfarer," raising his voice rudely, "is not 'Art for Art's sake,' but man's joyfulness, playfulness, and sadness in materials, rooted for centuries to the soil." G. LL. M.

OIL PAINTINGS, water colours, drawings, and sculpture, representing a gross weight of sixty tons, have been despatched from Australia for the coming exhibition of Antipodean Art at the Grafton Galleries.

THE foundation-stone has been laid of the new hall and club in connection with St. George's Cathedral (Roman Catholic), Southwark. The new structure will be very substantial, with a frontage on Westminster Bridge Road.

SIR WM. PRIESTLEY, the member for St. Andrew's University, has undertaken to defray the cost of cleaning and redecorating the magnificent ceiling of the library in the University of Edinburgh. Its neglected state was mentioned in the House of Commons, but the University Court then pleaded that they had no funds available.

GLASS-BLOWING AND WORKING.

By T. BOLAS, F.C.S., F.I.C.

THIS book is intended to give the amateur such full instruction in the art of glass-blowing as to enable him in the quiet of his own room to produce almost any small object he may desire to make, and contains the substance of demonstration lectures given by the author under the auspices of the Middlesex County Council. It is a model of what such a manual should be—clearly expressed, with every doubtful or difficult point elucidated by explanatory diagrams, and with the examples graduated in difficulty, so that the amateur who cannot successfully pursue the art by its direction and assistance must be either very dull or exceptionally clumsy. Not only are the various processes of manipulating the glass described, but directions are given, by following which the worker may make tools and appliances for himself which the experience of the author has gradually developed from the requirements of the processes, and which are, therefore, better than the ordinary trade appliances produced for sale. The practical notes commence with a chapter on the blow-pipe, in which various criteria are enumerated, whereby that condition of the flame which produces the best results may be recognised, and two or three convenient forms of jets are described. Next come some paragraphs on the subject of oil lamps of quaint shapes, designed to allow of turning the pieces of glass which are being operated upon easily, and then the important matter of the bellows is fully treated. After describing various useful minor tools and appliances (most of which may be made by the worker himself, if he has any talent for metal work), Mr. Bolas attacks the subject of the material, giving the composition of various kinds of white glass, ranging from the hardest silica and Bohemian glass to that which is softest and most easily fusible, used for glass-painting and enamelling. This chapter also contains a description of the forms in which the material may most easily be procured, with various cautions for the protection of the unwary purchaser. Then follow instructions for working the glass, commencing with the simple cutting of tubes, and proceeding through various more difficult processes (the articles described being principally for laboratory use) until the learner is conducted to the production of such difficult work as glass syringes without packing, and internal air traps, and other sealings. Modelling on the bulb and the production of spiral and other lines and threads enclosed within the glass are thoroughly explained, and a little further on modes of colouring glass and of producing "aventurine" are the subject of a chapter, so that the amateur if he have taste and perseverance may produce on a small scale glass vases resembling the productions of Murano. There is a chapter upon the making of scales of degrees and engraving them, in which several modes of performing the work are described, and another on the phenomena of devitrification and the changes which age produces in the material of both white and coloured glass, and the book ends with a short chapter on the manufacture of glass in small quantities, and with a list of books, easily accessible, from which the amateur may gain further information. The manual is written by a man who evidently knows his subject through and through, and whose object has been to place his knowledge at the disposal of his fellows; and, although everyone may not be able to quite agree with the author's enthusiastic expressions in his first chapter on the great educational value of the practice of the craft, there can be little doubt that success in the working of glass by the amateur must be accompanied by the acquirement of rapid perception, delicacy of touch, and the power of deciding quickly which course among several is best to follow.

["Glass Blowing and Glass Working, for Amateurs, Experimentalists, and Technicians." By Thomas Bolas, F.C.S., F.I.C. Price 2s. Dawbarn and Ward, Limited 6, Farringdon Avenue, E.C.]

THE WHEEL CROSSES OF CORNWALL.

By F. A. GINEVER.

IN a lecture on "The Wheel Crosses of Cornwall," Mr. F. A. Ginever pointed out that the wheel-headed cross was divisible into three parts—the base, the column, and the capital. Very commonly the base was omitted, and sometimes the shaft nearly or entirely disappeared. The essential feature was the circular head at the top. This was composed of two elements which we may see isolated in the Madron men-an-tol monuments, the double post and a circle. These double posts or equal slabs could be combined into four symmetrical figures:—(1) The Tau or T cross, or crux commissa, like a capital T, which is also seen in its inverted form; (2) the crux immissa has two forms—a Greek cross of equal arms, and (3) a Latin cross of unequal arms; (4) the crux decussata, or St. Andrew's cross, having the arms of equal length, but not at right angles to each other. All these were compounded with the circle. Obviously, if they were to fit the circle, they would be the Greek cross and the St. Andrew's; the other forms when connected with the circle were either placed above or below. The distinction of the disc from the column was emphasised when the column was furnished with lateral projections at the neck as at Gwithian.

THE IDEA OF THE HEAD

as representing a poised wheel or disc was illustrated by the brass resting on a column found in the catacombs, and in a tablet of the fourth century found in the Church of St. Demetrius Salonica, where the sacred wheel was alone in a frame without any column. Strangely the neck projections observed in the Perranporth cross, which seemed originally intended to support the crossed disc, were confined to Cornwall. They might be intended to represent an Abacus, as they appeared to do in the two crosses of Basil and Michaelstow, or the pillar might be taken to represent the T cross, the lateral projections being a rudiment of the cross piece, and the disc represent the circle or oval which surmounts Egyptian crosses. The figure sculpture of wheel crosses or Cornish crosses generally was both rare and rude. Unlike certain crosses which contain whole stories in stone, Cornish crosses had but one figure—that of Christ, and that generally of the most primitive execution possible. Of course, the intractable material of which the crosses were made had to be taken into consideration when criticising the sculpture. The work was in shallow relief, rarely exceeding a projection of 1½ in. The ornamentation was of great interest, both as showing the state of Art and as furnishing a clue to the ages to which they belong.

THE COINS OF CONSTANTINE

opened up the main question as to how the cross was first introduced. On one side was a monogram. It contained two letters, one the shape of a capital P, and the other the shape of a capital X. These two letters were called by many Christians, who did not know their real signification, the pax. The two letters looking respectively like X and P are, in reality, two Greek letters, Ch and R. The fluctuations between the monogram and the ordinary Greek cross were well exhibited in Cornish crosses. The monogram was introduced in its integrity into Britain as shown in the church at Phillack. Only ten of these monogram crosses have been found in the country, and of these Cornwall possesses five. There are three crosses, each with a halo around the head, and clothed with a sleeve tunic, at St. Buryan, St. Paul, and Sancreed. The Phillack Churchyard cross is likewise clothed in a tunic. There are altogether fourteen of these clothed figures. Pendarvis cross is an interesting boy cross, the figure with his straddling legs being absurdly vigorous and lively. The Institute cross is another boy figure somewhat similar. The Trevu cross is a boy figure with short arms and the shortest of legs. It is different from the other two crosses in being incised, not in relief.

PICTURESQUE CITIES

AND

Monasteries of the North of Spain.

I. BARCELONA.

By F. HAMILTON JACKSON.

(Continued from page 120.)

THE most important church, after the cathedral, is dedicated to Our Lady of the Sea—S. Maria del Mar—in which the body of S. Eulalia rested from 873 till 1339. The present building was erected between the years 1329 and 1383, as inscriptions near one of the doors record. It is one of the few churches built entirely by the working classes, the porters even contributing to the fund, in memory of which fact there are to be seen on the door of the principal façade among the pierced metal quatrefoils with which it is covered, two small figures carrying stone or wood. The name of the architect is as usual unknown. In 1379 a fire consumed the vestry, altar, choir, and a portion of the roof, but by the aid of Pedro IV. it was repaired and completed in 1383. The rose window of the west front is fine; it was almost destroyed by an earthquake in 1428, but was repaired. The interior is divided into three naves by lofty and elegant shafted piers bearing lancet arches; the choir is behind the presbytery, a very unusual arrangement in Spanish churches, and a gilded royal pew is placed opposite the great organ. The altar mayor has a poor retablo carved by a sculptor who was accustomed to ornamenting the poops of galleys. The windows are filled with very fine glass, as is common in Barcelona, and being rather lighter than usual, interior details are tolerably well seen. The church has four doors, one of which opens into the Plaza de Born, now used as a market, where many curious products of sea and land may be seen; which, in ancient days, was the place for tournaments.

The Calle de Moncada runs up from the corner of this Plaza, and contains several fine houses of the fourteenth and fifteenth centuries. S. Maria del Pino is also a good specimen of Gothic, with fine stained windows. It was built in 1380, and consists of a noble single nave of seven bays, the side chapels being placed between the piers of the flying buttresses which support the vaulting. It has a fine portal and belfry tower. Its name is derived from a tradition, according to which an image of the Virgin was found in the trunk of a pine tree, and a pine tree, blessed on Palm Sunday, is every year placed on the highest point of the belfry still in remembrance of the tradition. On the altars of the chapels of San Pancracio and San Clemente Jews had a right to take oath on the decalogue in any suit with a Christian.

In SS. Justo y Pastor is a chapel (that of S. Felio) at the altar of which the Jews had the same privilege. This church also consists of a single nave, and was built in 1345, that which it replaced having been the earliest Christian church in Barcelona. The nave is 43ft. 6in. in the clear, and 130ft. long, with apsidal end of five sides, and produces an imposing effect. Here, too, is good stained glass, as in nearly all the Barcelonese churches, making the interior rather dark until the eye becomes accustomed to the difference between the extreme brightness of the light outside and the comparative gloom, but it is never possible to see details of paintings sufficiently to examine them critically, the general effect being of a mysterious richness through which the various decorative details half appear, filling the eye while they are difficult to disentangle one from the other. This mysterious richness reaches its acme in the cathedral, which is most impressive through it, although I do not mean to suggest that the design and proportion are not as great factors in producing that impressiveness.

The cloister of S. Ana is pretty, filled with plants and bushes, and with a well in the centre, of which a pleasant glimpse may be had through the entrance doorway. The church

has been so much modernised as to have lost interest; it was built in imitation of that of the Holy Sepulchre by the patriarch of Jerusalem. In the church of S. Miguel is a blue and white mosaic pavement said to have belonged to a temple of Neptune. The font appears to be part of an antique candelabrum. This church was altered in 1002. The principal doorway is a curious mixture of Romanesque and Saracenic styles. The church of El Belem on the Rambla is covered with rich marbles inside with the worst effect; it contains the sword of Ignatius Loyola which he offered to the Virgin on the altar at Montserrat; and there is also a crucifix in this building which attracts a great deal of devotion and is ablaze with candles.

Two very interesting churches have been referred to as extra-mural, S. Pablo del Campo, and S. Pedro de las Puellas. The first is a Romanesque structure built in 913 by Wilfred the 2nd, though restored in 1117 by one Guiterdo and his wife. It is cruciform, with three parallel apses, and an octagonal vault on pendentives over the crossing, nave and transepts being covered with a wagon vault. The west front is purely Byzantine, except for the circular window. The cloister is very quaint, the arches being quite Arabian, while the coupled columns and their capitals

are Romanesque; on two sides of the cloister these Arabian-looking arches have three foils, and on the other two, five, with great buttresses in the centre. The other church was so called, because it was destined for a nunnery. It was built about 980 by Count Sunario, after the earlier church (erected by Louis le Debonnaire), was destroyed by Al Mansour. At that time it is said that the nuns disfigured themselves by cutting off their noses, to avoid the shame of being taken to the Balearic harems. The sculpture of the capitals is quite Eastern in character, but very little of the ancient church is left unaltered.

In Barcelona the public scribe still plies his trade, adding to it that of registry office keeper for servants and boarding houses, and accountant. His offices may be seen on the Rambla. This thoroughfare was once a stream, "la Riera den Malla," which bounded the city on the west side, running just outside the wall. "Rambla" (from the Arabic "Raml," a sandy heap) means a river bed, which in Spain, being often dry in summer, is used as a road. Beneath this street runs a great sewer large enough for a man on horseback to ride in, which is said to be Roman, but is more likely to date from the time when the river was covered over, so as to provide for the escape of storm waters. Just at the com-

DOORWAY OF S. MIGUEL, BARCELONA.

mencement of the Rambla are the Atarazanas, or arsenal, which were constructed in 1243 by James the Conqueror. They are now used, in a very much altered form, as barracks for infantry and cavalry. They originally extended along the whole sea front as far as the Plaza del Palacio, and could contain, securely sheltered, twenty-five large galleys at a time. It is interesting to note that this word (which means dockyard in Arabic) is the root of the word arsenal, through the Catalan "Dressana" and Spanish "Dársena." Above them rises the hill on which is placed the Castle of Monjuich, a name which may be derived either from the Roman Mons Jovis, or the mediæval Mons. Judaicus, the Jews having had their cemetery between it and the city. Outside the cathedral, in the Plaza Nueva, are the only remains of the old walls now to be seen, a gate flanked by two round towers, which still remain.

The Lonja, or Exchange, in the Plaza del Palacio down by the sea, contains a fine Gothic hall of 1383, but nothing else has escaped the hand of the "beautifier," who began his work in 1770. He was a French architect, and his work was not approved by the municipality, so it no longer exists, but he was powerful for destruction! The present building was erected by a man named Juan

Soler, and contains, besides the Exchange, an Art school and picture gallery—mostly filled with the works of Catalan artists, among which is a brilliant Fortuny, representing the battle of Tetuan. Most of the public buildings have been subjected to the same ordeal, the Casa de la Diputacion at the hands of Pedro Blay in 1609. The Casa Consistorial, too, has a Doric façade, though it still retains a portion of the original Gothic in the Calle Ciudad, near to SS. Justo y Pastor. This consists of a roundheaded doorway with very long voussours, surrounded by an oggee crocketed hood-mould, which bears upon its summit a figure of S. Michael under a canopy with large wings of bronze. The wall is pierced by several windows with coupled lights and foiled heads, and terminates in a pierced parapet sup-

S. MARIA DEL MAR, BARCELONA.

Cloister

S. Ana Barcelona

SKETCHED BY F. HAMILTON JACKSON.

ported by trefoiled arcading. The moulding surrounding the door turns in a curious manner at right angles—following the angle of the wall—before terminating. This part of the building dates from 1373. The patio also is fine. The Casade la Diputacion on the other side of the Plaza contains a courtyard dating from the end of the fourteenth century—a very elegant Gothic work; and also a façade in the Calle del Obispo in the same style with a pierced parapet of beautiful design, below which gargoyles protrude. On the other side of the building are some ajimez windows, the slender shafts of which look very pretty and delicate. In the courtyard is a staircase to the state rooms, which is much admired. Within may be seen some rich artesonado ceilings, and good but worn tapestries; also a series of portraits of Kings of Spain, commencing with Ataulfo, which are earlier than the sixteenth century. The Jews' quarter was just here; it extended from the Plaza de la Constitucion to the Calle del Call. In 1891 it was sacked and destroyed by the mob under the instigation of San Vicente Ferrer. The streets around the quays have picturesque arcading on the ground floors, made use of by the shopkeepers for the display of their wares, and useful also for protection from the fierce rays of the sun. In the Calle de la Merced is a very beautiful doorway to the church of S. Miguel, with a group in the tympanum showing the victory over the dragon, and with statuettes of angels in niches at the sides. This resembles that of S. Jaime in the Calle Don Alfonso Trece, figured by Street, but appears to me more beautiful.

In the hospital of Santa Cruz is a balcony and stair a good deal like that in the Casa de la Diputacion; also some good ironwork, and one of the finest knockers in Barcelona.

There are still some of the abortions of the exhibition left in the Park grounds. A fountain, consisting of the figure of a lady in modern costume standing on a pedestal and holding aloft a parasol, from the ends of the ribs of which the water streams! And an erection, supposed to represent Montserrat, made of concrete, and in the style of the worst tea-garden ornamentation. Also several less objectionable fountains, based apparently on

Sèvres or Dresden china. But the city is charming in many ways to those who pay but a short visit, though the habits of the people apparently make no allowance for the necessity of sleep, the streets being full until 2 a.m., and market traffic commencing before 4 a.m.

I will conclude with two historical facts, showing the character and reputation of Barcelona and its people. When Columbus was received here by Ferdinand and Isabella after his return from America the first time, the jealousy of the maritime supremacy of Castile was so great that no record of the fact was made in the archives either of the city or of the kingdom of Aragon! Nor does the "Dietaria" of 1492 say anything about it.

Kings on entering Barcelona for the first time were obliged to take oath to defend and never to transgress the popular laws (fueros) of the city. The councils (Jura) used to take place in different parts of it, and before the high altar of the cathedral. When Charles V. visited it in 1519 he wished to be received not as King of Spain, but as one of the former Counts. "For," he said, "I would rather be Count of Barcelona than King of the Romans."

A new porch has been erected on the south side of St. Martin's Church, Leicester. The porch was designed by the late Mr. J. L. Pearson, and around it are statues of John Wycliffe, Archbishop Magee, St. Guthlac, and others.

A new residential hotel is to be built in Leicester Square at a cost of £40,000; another to be called the Tudor, on the sites of 79, 81, 83, 85, 87, and 89, Oxford Street, and 1, 2, 3, 4, and 5, Dean Street, at a cost of £25,000; the Carlton Hotel, on a portion of the site of Her Majesty's Theatre, whilst the Marlborough Hotel, at the corner of Bury and Ryder Streets is to be enlarged.

THE NEW GOVERNMENT OFFICES.

HOW THEY ARE TO BE BUILT.

THE new public buildings, for which Parliament has been asked to vote £2,550,000, may be divided into three distinct groups:— (1) The new Government offices in Parliament Street; (2) The completion of the Science and Art Museum at South Kensington, and (3) The new Post Office Savings Bank. As soon as the money is available, work will be commenced on all the buildings. All the plans and designs are in an advanced state of preparation, and before next Christmas the work of building will probably have been begun. An entirely new method is to be followed with regard to the new Government buildings in Parliament Street. As Mr. Akers-Douglas announced, the Government does not intend to invite architects to compete for the designs of the new buildings. It has been decided to allow the officials of the Board of Works to design the interior of the new offices. The Board of Works, it is believed, regards the internal construction of the General Post Office North and the new Post Office, at Liverpool, as pretty nearly perfect as regards convenience, and will probably follow them somewhat closely when

DESIGNING THE NEW INTERIORS.

When this has been done, and only then, the Government will appoint an architect, who will be asked to design the shell of the buildings. It is proposed that the new buildings shall be made to harmonise with the offices which already stand in Parliament Street, and build them of Portland stone like that which was used in the Houses of Parliament. It will be seen that the Government do not intend to

allow the architect whom they may select a very free hand. The whole of the work will in reality be under the control and direction of the Board of Works. The money for the purchase of the sites of the new offices was voted in 1895 and 1897. The acquiring of the land, however, has been somewhat delayed, owing to the numerous arbitrations which have been necessary in order to decide upon a fair sum. The demolition of the houses in Parliament Street has not been accomplished as quickly as had been hoped. Curiously enough, Parliament itself is to a large extent to blame for this delay. Ever since it reassembled the police have not allowed carts to approach the buildings after noon. This regulation has practically confined

THE WORK OF DEMOLITION

to the early morning hours. The buildings which will be constructed under the sole control of the Board of Works are the War Office, the Board of Trade, the Education Department, and the extension of the Local Government Board. The completion of the Admiralty building has already been designed and contracted for, and will be proceeded with at once. The present proposal for the construction of the Science and Art buildings at South Kensington differs considerably from the scheme of 1891. The new buildings will be constructed on the designs of Mr. A. Webb, which were approved for the scheme of 1891, but will have to be considerably modified in order to meet the present proposals. Instead of two buildings east and west of Exhibition Road, the Government now intend to provide all the necessary extra accommodation in one building to the east of that road. The additional room will be obtained by removing the temporary buildings which are at present situated in the grounds of the Museum. By this means it is hoped to find ample room for the requirements of both Science and Arts Depart-

Cloister - S Pablo del Campo
Barcelona

SKETCHED BY F. HAMILTON JACKSON.

ments for some time to come. Should the new building prove inadequate, the utilisation of the Imperial Institute for the science section is a proposal which will probably be seriously considered. If that building had been available at the present moment, it would have obviated the necessity of erecting so large an extension in Cromwell Road as is at present proposed. Those, however, who have the control of the Institute are still hoping against hope that something may happen which will make it popular. By the proposed removal of the Post Office Savings Bank, that institution will probably be able to effect the saving of a large sum of money. The Bank will sell their present valuable building to the Post Office, and, as it is to obtain a grant of £300,000 towards its new home in West Kensington, there will probably be a round sum to be placed to the credit of the Bank. The follow-

ACETYLENE GAS.*

By C. T. MARSHALL.

ACETYLENE gas, although as a practical illuminant a thing of to-day, possesses a history, and a not uninteresting one. Its discovery has by many been ascribed to Sir Humphrey Davy, and, although this is not the case, he cannot be said to be entirely disconnected with it, as it was in following up one of his great relative's discoveries—the production of the metal potassium—that Edmund Davy, in the year 1836, while experimenting with a process for the production of this metal, found a black residue in the retort, which, like potassium, decomposed water, but instead of the gas given off being pure hydrogen, it was found to be a compound of that gas with

henceforth stood known to the world as Acetylene. On October 17th, 1892, Macquenne announced to the Academy of Sciences that he had made barium carbide by heating barium carbonate, magnesium powder, and charcoal in an iron bottle, and that on treatment with water or other hydroxylated compound, it yielded Acetylene gas, and on January 19th, 1893, Mr. Travers announced to the Chemical Society that he had also made carbide of calcium by heating a mixture of sodium, calcium chloride, and powdered gas carbon—the resulting mixture giving 16 degrees of calcium carbide. The discovery of a method of making carbide of calcium cheaply, and in larger quantities, was, as previously stated, the result of an accident. Mr. Thomas Leopold Willson, a Canadian chemist, had devised a process for the production of aluminium by the use of an electric furnace, but found himself

COTTAGES AT SCARBOROUGH. W. E. BARRY, ARCHITECT.

ing table shows the sums which are to be expended on the new public buildings:

PARLIAMENT STREET—	
War Office	£475,000
Board of Trade	} £600,000
Education Department	
Local Government Board	
(extension)	
Admiralty (additional extensions)	£275,000
SOUTH KENSINGTON—	
Science and Art	£800,000
WEST KENSINGTON—	
Post Office Savings Bank	£300,000

Total £2,450,000

In addition to these sums for buildings, £100,000 is required to complete the purchase of the Parliament Street site, bringing up the total paid for that site to £245,000. For the purchase of Carrington House, the site of the new War Office, £500,000 was voted in 1897.

MR. JOHN WARD, assistant borough surveyor of Sheffield, has been appointed borough surveyor for Derby.

carbon, two volumes of hydrogen combining with two volumes of carbon to form a hydro-carbon, differing in composition from any hydro-carbon then known, which we now know as Acetylene. In 1862 Wohler made carbide of calcium by fusing an alloy of zinc and calcium with carbon, and ascertained that it decomposed in contact with water, forming calcic hydrate and Acetylene. In the same year, the great French chemist, Berthello made

A SERIES OF INTERESTING EXPERIMENTS

upon this gas. He found that, as the electric arc passed between carbon electrodes in an atmosphere of hydrogen, direct combination took place between these elements, and Acetylene was thus synthetically produced. He also found that when the vapours or gases of more complex hydro-carbons came to be passed through heated tubes this same gas made its appearance in small quantities. In addition to carrying out these experiments, he took upon himself the responsibility of giving it a name, and the newest of the hydro-carbons

* Extracts from a paper read before the Northern Architectural Association.

debarred from carrying out work on aluminium owing to certain patent rights. Whilst attempting to utilise his electric furnace for obtaining the metal calcium by reducing lime with finely-powdered charcoal, he found that at the

TEMPERATURE OF THE ELECTRIC ARC

an interaction took place, which resulted in the evolution of carbon monoxide, and left behind a fused mass which solidified to an extremely hard semi-crystalline body. The experiment was a failure. Anything but pleased with the result of his experiment, Mr. Willson threw the mass into the stream, which drove the turbine. The substance thus thrown so lightly aside did not behave with the modesty of unconscious merit; on the contrary, it made itself both seen and felt in the most unmistakable manner, by causing a violent effervescence in the water, and giving off an odour that demanded the undivided attention of all those who came within reasonable distance of it. This remarkable action was not without its result. Some more of the substance was at once made, and examined chemically, when it was found to be what is

known as carbide of calcium, and upon being brought into contact with water it gave off large volumes of Acetylene gas. In describing Mr. Willson's discovery of the formation of carbide of calcium in the electric furnace, I must not overlook the claims of M. Moissau. As to which of these two gentlemen was the first to notice the accidental

FORMATION OF THE CARBIDE

in his electric furnace, I am, for obvious reasons, not prepared to make any rash assertions; we can merely take the assertions of the rival claimants, and according to them each discoverer was an undoubtedly good first. But, when it comes to the announcement of these discoveries, we are on firmer ground, and these seem to leave no reasonable doubt as to the validity of Mr. Willson's claim. Carbide of calcium is a hard, greyish substance, containing forty parts by weight of calcium, combined with twenty-four parts by weight of carbon. It has a specific gravity of 2.26, and the theoretical yield of 11b. when saturated with water is 5889 cubic feet of gas. In practice the average yield of good commercial carbide is about five cubic feet per pound. The evolution of Acetylene gas upon water being brought into contact with carbide of calcium is due to the chemical affinities of hydrogen and carbon and of oxygen and calcium. Immediately upon contact a double reaction takes place. The oxygen of the water combines with the calcium of the calcic carbide to form lime, while the hydrogen of the water combines with the carbon of the calcic carbide to form Acetylene. Acetylene is a gaseous compound, composed of twenty-four parts by weight of carbon with two parts by weight of hydrogen, having a specific gravity, as compared with air of 0.91. When burnt it gives a flame of intense brilliance, the rays being almost identical with those of the sun. It is far superior as an illuminant to any other known gas, five cubic feet of it giving an illumination of 240 candle-power, as compared with 16 candle-power given by the same quantity of coal gas. It has an intensely penetrating odour, which somewhat resembles garlic, its strong smell being a very great safeguard in its use, as the smallest leakage would be at once detected. Indeed, so pungent is this odour that it would be practically impossible to go into a room which contained any dangerous quantity of the gas. Although Acetylene has of itself so recently become a practical illuminant, it has long been recognised as

THE SOURCE OF LUMINOSITY

in all hydro-carbon flames. We have recently had many alarmist statements as to the safety or otherwise of Acetylene gas, and I now propose to deal with it from the point of view of its explosibility, poisonous nature, heat of the flame, and products of combustion, as compared with coal gas. It is explosive over a slightly wider range than coal gas. Mixtures of air and Acetylene commence to be explosive when containing about 5 per cent. of Acetylene, while the proportion of coal gas in a mixture of air and coal gas required to make an explosion is about 8 per cent. These figures appear to favour coal gas in the proportion of eight to five, but further inquiry nullifies this advantage. In an escape caused by a tap being left on, the average coal gas burner will pass at least 5 cubic feet of gas per hour, during which time an Acetylene burner would only pass $\frac{1}{2}$ ft. gas, while if the escape were caused by a hole in the pipe, the amount of gas escaping would depend upon the specific gravity of the gas; the specific gravity of coal gas is .4, that of Acetylene is .9, thus the proportionate amount of gas escaping under similar conditions would be two (2) volumes of Acetylene to 3 of coal gas. It will thus be seen that while, if the escape is caused by a trap being left on, the comparison is overwhelmingly

IN FAVOUR OF ACETYLENE,

if it is caused by a hole in the pipe the two are practically equal. This is without taking into consideration the odour of Acetylene, which, as previously mentioned, makes no mistake about

giving warning of any escape. An Acetylene gas flame only gives off one-fifth of the heat given off by a coal gas flame. For the generation of Acetylene gas all that is requisite is to bring carbide of calcium into contact with water. This must obviously be done in one of two methods, either the carbide may be dropped into water, or water may be allowed to flow into the carbide. Both methods have their advantages and disadvantages. Taking the first principle, that of dropping the carbide into water, from a chemical point of view, it is undoubtedly the best, but from a mechanical point of view it has serious limitations; by dropping the carbide of calcium in small pieces into a comparatively large volume of water, there is practically no rise in the temperature, the decomposition is perfect, and having to bubble through the water the gas is condensed, washed, and freed from impurities. Its main disadvantage from a mechanical point of view is the practical impossibility of making, at a moderate cost, a small automatic generator that will work in a satisfactory manner. The difficulties are of a purely technical nature, and I do not propose to go into them here. Mr. Dargue considers that very large apparatus should be made on this principle, and that they should not be automatic in action. The second principle, that of allowing the water to flow to the carbide, is, for a very obvious reason, that most generally adopted, the reason being its adaptability to

THE CONSTRUCTION OF GENERATORS

of a moderate size, designed to work automatically by allowing the water to flow by gravity to the vessel containing the carbide of calcium, and the cutting off of the supply of the same, either by the action of a valve closed by the rising of the gasholder, when, a certain amount of gas having been made, causes it to rise above a certain point, or by the back pressure of the gas when a certain amount of gas has been made. As a result of the automatic operation of these generators, a large storage capacity is not required in connection with them; they can therefore be made of a comparatively small size, and at a moderate cost. It is for this reason practically certain that most generators will be made on this principle, and it is necessary that we should give our very careful attention to any faults that there may be in this principle, and to the methods in which these faults may be overcome. The conditions given rise to by this method of generator, which necessitate special precautions being taken to overcome them (and this is especially the case in those machines where the water is sprayed on to the carbide), are that the heat developed during the reaction is sufficient to polymerise some of the Acetylene into liquid products of a tar-like nature, and that by decomposing all the impurities present in the carbide, the gas is rendered extremely impure. These impurities, if not dealt with, are likely to find their way into the pipes, and to cause stoppages in the same. The conditions can be overcome by (1) enclosing the carbide container in a water jacket, (2) by passing the gas through water or some other purifying agent. As I have previously stated, there are two principles on which generators working on this principle can be designed. They may be made on what

I call the "gasholder principle," having the supply of water regulated by a valve opened and closed by the falling and rising of the gasholder, or upon what I call the "back pressure of the gas principle," in which there is no cut off between the water and the carbide container, the water being driven back by the pressure of the gas after a certain amount has been made.

KEYSTONES.

The foundation-stone of the Missions to Seamen Church, in Poplar, has been laid.

The amount of the contract for constructing a railway from Llanishen to Castell Coch, undertaken by Messrs. Monk and Newell, of Liverpool, is £61,345.

No lover of Art will hear without sorrow of the untimely death of Mr. Aubrey Beardsley. He was, always excepting Mr. Whistler, the most original artist of his time.

The Birmingham City Council has adopted a report from the Public Works Committee for the purchase of land on the left side of Cherry Street, to widen that thoroughfare by 6ft. 6in., at a total cost of £12,300.

A LOCAL GOVERNMENT BOARD inquiry has been held at Leicester, with respect to the application of the Town Council for sanction to borrow £19,700 for the purchase of property required for street improvements.

THIRTEEN sets of plans for the proposed new Board School for the Intack district of Blackburn have been sent in by local architects to the Blackburn School Board, and the drawings are now in the hands of the assessors.

A LOCAL GOVERNMENT BOARD inquiry has been held at Kingstown, Ireland, with reference to the application of the Township Commissioners for a loan of £6600 for the purpose of erecting municipal buildings, £1000 for sewers, and £2000 for concreting footpaths and providing kerbing.

The tomb of the late Duke of Clarence in the Albert Chapel at Windsor Castle is now being completed. A recumbent statue of the deceased Prince is to be placed upon the lid of the beautiful Mexican onyx sarcophagus containing the coffin, and the Royal burial-place will be surrounded by handsome bronze railings.

At the Halifax Town Hall a Board of Trade inquiry has been held respecting an application by the Corporation to borrow an additional sum of £20,000 for tramways purposes—namely 10,200 yards of land, at 3s. 6d. per yard, for a car depot at Highroad Well; the erection of sheds, £3250; fourteen cars, at £190 each; and fourteen trucks, £6300.

THE Wesleyan General Chapel Committee have just sanctioned proposals for the erection of thirteen new chapels in various parts of the country, at an estimated expenditure of £38,980. This brings up the total to twenty-six within the past two months. One of the proposed new chapels is at Brentford circuit, Twickenham being the site selected. Another new chapel, estimated to cost £9153, is to be built at Weston-super-Mare. It will seat 1000 persons. A sum of £5364 is to be expended on alterations.

GROUND PLAN.

1ST FLOOR PLAN.

COTTAGES AT SCARBOROUGH. W. E. BARRY, ARCHITECT.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
March 30th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

IN connection with the new building programme of the Government, it is stated that the services of Sir John Taylor, the chief surveyor of the Office of Works, who in the ordinary course would retire very soon under the age regulations, will be retained for some years. It is understood that Sir John will officially be superannuated, but he will continue to act as expert adviser to the First Commissioner, and in the capacity will receive a salary which, added to the amount of his pension, will equal his present emoluments.

THE extension of the Record Office, by which the front portion of the imposing structure in Chancery Lane is connected with the huge block in the rear, and the site of the old Rolls House and Chapel completely covered, is now nearly finished. The work has been carried out by Messrs. Foster, of Rugby, under the supervision of Mr. Dyer, of her Majesty's Office of Works. With a slight exception, it is in complete harmony, architecturally, with the rest of the structure, the only difference being that three large windows on the south side mark the large apartments in which as many of the features of the old Rolls Chapel as possible are to be preserved. This will form a museum to which the public will be admitted without the restrictions that have naturally to be observed in other parts of the building.

THE scheme for the provision of a new Art Gallery for Bradford, to replace the present inadequate arrangements at the Free Library in Darley Street, has been before the Bradford Free Library Committee. The proposal is for that Committee to join the Markets and Fairs Committee in the new extensions of the markets in Rawson Square, the ground floor premises to be devoted to markets purposes, and the upper to the Art Gallery. By this means the Library Committee would avoid exorbitant outlay on site, and by apportionment of cost it is thought the scheme may be brought within the narrow limits of that Committee's spending powers.

IN a letter to the Times, on the subject of the restoration of the old parish church of Bow, which is practically in ruins and has been closed for some months, the Bishop of Stepney says:—"It is possible that some may have been deterred from contributing by the fear that in the restoration of the church some injury might be done to its beauty. It will be a satisfaction to these to know that representatives of the National Trust, the Society for the Preservation of Ancient Buildings, and the Committee for the Survey of Greater London have accepted my invitation to serve upon the Restoration Committee, and that the plan of repair is approved by the whole committee. To carry out these plans, a sum of £3700 will be required, towards which we have at present £900 in cash or in

promises. It will be observed that, by restricting ourselves to repair and abandoning the idea of enlargement, we have saved a considerable portion of the £5000 mentioned in our original letter, though we thereby, of course, endanger grants from societies given on condition of enlargement. The moment we obtain an adequate proportion of the £2800 still needed we shall begin at once to repair the old church, which is crumbling away more every day that it is left."

THE prizes offered by the Corporation of London for the best designs for a medal to commemorate Her Majesty's Diamond Jubilee have just been awarded (first prize, £20) to Messrs. Spink and Son, Gracechurch Street and Piccadilly; (second prize, £15) to Mr. J. Gamble, 24, Rich Terrace, South Kensington; and (third prize, £10) to Mr. A. B. Sykes, 16, Perry Hill, Catford. Sixteen designs were sent in, and fourteen accepted for competition.

No decision has yet been arrived at as to the successor of the late Mr. Howe in the clerkship of the works at Windsor Castle. There is very little doubt, however, that the principal nomination to be shortly made will be Mr. Nutt, who, so far as such a position exists, has served as the assistant clerk. Mr. Nutt is officially known as the draughtsman to the Office of Works, which is under the direction of the First Commissioner and is a Civil Service appointment, the maintenance of the exterior fabric of Windsor Castle being a public concern. Mr. Nutt has also held hitherto a simultaneous appointment as surveyor to St. George's Chapel, and as such has derived further emoluments from the Dean and Chapter. He has, moreover, done a great deal of work for the Princess Henry—as, for example, in designing some portions of the Battenberg Memorial Chapel at Whippingham.

AN attempt is being made to raise funds for the restoration of the tower of St. John de Sepulchre, Norwich. The church is situated just within the gates of Ber Street, and, according to history, is one of the twenty-five churches in the city which were erected by Edward the Confessor, but the real founder was probably William de Beaufort, who was then bishop of the diocese, and resided at Thetford before the removal of the See to Norwich. The church has undergone many changes, and nothing now remains of the old church of 800 years ago. To give an idea of what it was like, a glance must be made at the Church of St. Julian, situated in King Street close by, which has remained almost unaltered to the present day, especially the ground plan and round tower. The church tower is one of the landmarks of the neighbourhood. With one exception it is the highest point in Norwich, but it is badly cracked almost from summit to base. Of its peal of five bells, two are broken and the remainder require refitting. A new bell frame is also badly needed. A sum of about £1000 is required.

NONE but a French hand guided by instinctive French taste could have effected so charming a decorative arrangement as the Hanover Gallery now displays. Mons. Lachenal is very well known in Paris, both by private appreciation and by the greater publicity of exhibitions. He has done well to give Londoners a chance of seeing his art in ceramic, for form, modelling, colour, texture, and ornament are not of ordinary class, and, save in a few instances, have no hint of that triviality often associated with French objects of this kind. Texture is no mean aid to beauty, and in these pieces it is sometimes like the skin of a fruit, at others portions of a vessel will be highly glazed and parts left with dead surface. Colour is fine and of infinite variety, while in some of the multi-coloured vases, jars, plaques, cachepots, &c., there is a delightful suggestion of fleeting lustre. Very restful are the many instances of self-colour in tones of jade green, while other shades are of marl grey, toad tone, or of the loveliest bright blue, sanguine, and

yellow, for which no descriptive names can be found. Ducks, drakes, the Gallic cock, &c., are used often and with vivacity, but this appeals to fine tastes less than do the more ideal creations or those handsome objects in which proportion and glorious colour, either positive or neutral, or combined, are wedded. There are some vivacious busts, and a few sculptures by Madrassi, Masseau, &c., which Mons. Lachenal has translated into ceramics.

THE mosaic which was recently discovered at Boscoreale has been acquired by the Museum at Naples for £2000. It is a picture of no ordinary character. The central subject is surrounded with a beautiful garland of flowers and fruits, and represents four persons seated at a semicircular bench, with a background of an acropolis and a city. The savants at Berlin and at Naples are agreed that it probably represents Aristotle, Pythagoras, Plato, and Socrates; while behind them are two philosophers of less distinction.

THE scheme for connecting western and central Denmark by a bridge over the Little Belt is so far matured that it will shortly be laid before the Legislature of Denmark. The only difficulty seems to be that of expense, the estimated cost of the undertaking being £650,000. The distance to be spanned is about 4500ft., and the bridge, if made, would be 130ft. in breadth. It would be 130ft. above sea-level, supported by groups of four or six iron pillars from 800ft. to 1000ft. apart, and standing on foundations carried to a depth of 20ft. or 30ft. below the sea-bed. Four years would be required to complete the work.

NORWICH Cathedral must evidently be added to the list of crumbling and decaying edifices. The Dean recently gave a pitiable description of the present state of things. He said: "I fear that crowds of people who worship here never give themselves the trouble to see the state which the beautiful cloisters are in. They are literally falling to pieces. Approach the square by ascending the steps, and you will see their pitiable condition. I dare not face the repair without £3000; and in my life I have no hope whatever of that sum. The Dean and Chapter also desire to unflake the nave, and make it as is the choir and the transepts, comely and beautiful. Are there no churchmen who will undertake this necessary and stately piece of work?" Restorers have been busy about the cathedral for years past.

THERE is a delightful collection at the Goupil Gallery just now, with variety enough to suit the most catholic taste—work by the Barbizon School, by the modern Dutchman, by M. Cazin, Mr. Watts, Mr. Clausen, Mr. Swan, and Mr. Peppercorn, and with one wonderful group of pictures by Mr. Whistler. Here you will find again the "Valparaiso," that haunting poem of the night; and here, too, you will see another nocturne, "Blue and Gold," the serene and solemn impression of the hour "when the evening mist clothes the riverside with poetry as with a veil . . . and the whole city hangs in the heavens, and fairyland is before us." And in Mr. Whistler's own words, we have also the clue to the loveliness of "In the Studio," for the simple arrangement of grey and roses is full of "the painter's poetry" of which he writes: "The amazing invention that shall have put form and colour into such perfect harmony that exquisiteness is the result." There are two other small pictures by Mr. Whistler, "The Barber's Shop" and "Resting," each as exquisite in its way. It is round this little group that the interest of the show centres; but there is hardly a picture hung that is not worth looking at. Very lovely is Corot's "Marissel," with the white church on its little hill and the avenue of tall, graceful trees leading up to it; and the pastoral, "Under the Trees," by Mauve; and the girl "At the Well," by Matthew Marius, painted, we should say, some years since, when his dreaming on canvas took more substantial form, more definite expression. Altogether, here is a collection to remind you—and the

reminder is needed—that modern Art is not all degraded to the level of the tedious trivialities and petty little eccentricities that go to the making of the average Bond Street show.

EAST LONDON will have an attractive show in the Whitechapel Picture Exhibition this Easter. Canon Barnett has succeeded in borrowing about fifty of the works by Millais which have been at Burlington House. Her Majesty the Queen lends the portrait of her Royal Highness Princess Marie of Edinburgh; and the Duke of Westminster, Mr. Alexander Henderson, Mr. C. J. Wertheimer, and Messrs. Angew are among the owners who are allowing their treasures to be transferred to St. Jude's schools. The Exhibition will close on April 17.

WHAT is known as the "Brook Hospital Scandal" was again discussed at the meeting of the Metropolitan Asylums Board recently. It will be recollected that the expenditure on the new building largely exceeded the estimate. The committee had recommended the payment of the contractors' claims as finally adjusted by the architect, and the renewal of an application to the Local Government Board for an order authorising the further expenditure on loan, in respect of the erection, equipment, &c., of the hospital, of the sum of £100,000 in lieu of the sum of £75,000 applied for on October 10, 1896. To this Mr. J. H. Brass had moved as an amendment: "That the report be referred back to the committee for them to report as to the cause of the extra expenditure, as to the several contractors not executing the works in accordance with the sealed contracts, as to the power of the architect to order additional work without the authority of the board, and as to whether the certificates of the architect for such works are, or are not *ultra vires*."—In continuing the adjourned debate on the subject, Mr. J. H. Lile attributed blame to the committee in allowing the architect to incur an extra expenditure of nearly £39,000 without reference to the committee, but said he did not think there was any evidence to show that if the whole of the items of extra expenditure had been brought before the committee the expense could have been in any way reduced. Although a very much larger sum had been expended on the hospital than was originally contemplated, the rate-payers had good value for their money. He hoped, however, they would not conduct matters in such a loose manner with the architect in future, and would not sanction even the expenditure of £50 without the knowledge of the committee.—After further debate the amendment was lost by 44 votes to 5, and the recommendations of the committee were agreed to.—Mr. John Lobb then proposed, "That the whole matter be referred to the Local Government Board to ascertain whether section 14 of the Metropolitan Poor Law Act, 1867, has been contravened by Mr. Brown in supplying bricks used in the erection of the Brook Hospital."—This having been seconded, Mr. J. Willmott said a dishonest attack had been made upon Mr. Brown (a member of the Board). The bricks manufactured by Mr. Brown were purchased by merchants and builders all over the country, and, amongst others, by a firm of merchants in London, who supplied a comparatively small number to the builders of the Brook Hospital. Mr. Brown had no control over the merchants or builders, and the only way in which he could prevent such an occurrence was to give up his business entirely.—Upon a show of hands the motion was lost.

THE equestrian statue of Lord Roberts, which has been unveiled at Calcutta, cost about £4000, the metal from which it was cast being obtained from fourteen guns presented to the Government for the purpose. Both the statue and pedestal were designed by Mr. Harry Bates, A.R.A. The allegorical figures at each end of the pedestal are symbolical of "Courage" and "Fortitude." The friezes encircling the pedestal represent the march from Kabul to Kandahar.

In the House of Commons on the 21st inst., Mr. Akers-Douglas, replying to Mr. Bartley (Islington), said: Mr. Aston Webb, who in 1891 prepared the plans for additions to the South Kensington Museum, will be instructed to draw up revised plans for the extended scheme now proposed. Hon. members shall have an opportunity of inspecting them before they are finally accepted.—Lord Balcarras subsequently asked the First Commissioner of Works whether, in connection with his statement about new buildings for the South Kensington Museum, it is to be understood that the science collections now housed on the west side of Exhibition Road are to be moved to the new buildings to be erected on the east side of Exhibition Road; whether it is also proposed to move the Indian and Oriental collections to the new galleries; and what is proposed to be done with the large extent of land upon the west side of Exhibition Road and the buildings now occupied by the science collections.—Mr. Akers-Douglas said, in reply: With regard to the first and second paragraphs of the question of my noble friend, the answer is in the affirmative. With regard to the third paragraph, I can only say that it is a matter which will receive the attention of the Government when the new buildings it is proposed to erect on the eastern side of the road approach completion.

A CORRESPONDENT writes:—"I see various proposals to restore old churches in Cornwall. Permit me to say that I trust due regard will be taken, in the process of restoration, for the old records within such churches. A church is not only a place of worship, although that is its *raison d'être*, but it is also a storehouse of historical data, more or less valuable to the historian and genealogist. Sometimes when the floors are relaid, stones with inscriptions are removed or altogether cast aside. This ought not to be done. When a church floor, covered with old memorial stones, is to be tiled, or otherwise relaid, a plan of the church ought in every case to be drawn, the stones in question numbered on the plan, and the inscriptions copied in accordance with such numbers. The plan and records should then be preserved as carefully as the registers. Where possible all stones with inscriptions should be themselves preserved, and in the original places. But it would be much to be able to refer inquirers, or descendants of those interred, to an accurate plan."

THE latest addition to the vast collection of Art treasures in the private apartments at Windsor Castle is a life-size bust in white marble of Prince Henry of Battenberg, by the Countess Gleichen, daughter of the late Prince Victor of Hohenlohe-Langenburg. This bust has been placed on a pedestal at the upper end of the corridor. The Queen intends to place a replica in one of the niches in the Prince Consort's mausoleum at Frogmore, which are intended to be receptacles for memorials of deceased members of the Royal family.

THE Dresden Gallery has latterly been developing in a new direction. It has shared with the Louvre and our own building in Trafalgar Square the distinction of being amongst European Galleries remarkable for the Catholicity of its collection. In Holland, the pictures at Amsterdam, the Hague, and Haarlem are almost exclusively Dutch. In Italy, the galleries in Perugia, Venice, and the Vatican are almost exclusively of Italian masters; but Dresden is strong in most schools—Italian, German, French, and Dutch. Where it is weakest is in our own painters, but a recent purchase of an example of Raeburn may mark the trend of taste in a new direction.

THE referee's award in the action between James Miller (plaintiff) and the London County Council (defendants), remitted by order of Mr. Justice Hawkins from the Queen's Bench Division to Mr. Herbert Thomas Steward, architect and surveyor, of 45, Parliament Street, has been received. Litigation in the case has been pending since 1895. The plaintiff in the action is the owner of a number of

small cottages in Miller's Avenue, Stoke Newington Road. At the rear of these cottages and on a much lower level was a building which had been decreed as dangerous by the County Council officials. The case for the plaintiff was that the County Council sent its workmen from the Works Department and altogether demolished the alleged dangerous structure. In doing so they removed a portion of a wall which had hitherto held up the higher land at its back, and plaintiff's cottages were then in danger of falling down. To make the damage good the plaintiff had to build a new wall, and he called on the County Council to recompense him for the cost he had been put to. As that body declined to pay he brought an action for damages.—The Referee awarded the plaintiff £17 10s., and directed the defendants to pay the plaintiff his costs of the law action, including the cost of the reference and also the referee's fees and the cost of his award. The fees and the cost of the award were assessed at £65 9s. 6d. There were several counsel engaged in the case and twenty-nine witnesses—some of whom were leading surveyors—so that the costs of the litigation must be very heavy.

At the Surveyors' Institution, Savoy Street, Strand, a tribunal of appeal under the London Building Act, 1894, has sat to adjudicate upon an appeal by the London School Board against a notice of requirement served by Mr. Ellis Marsland, the district surveyor of Camberwell, calling upon the Board to make certain teachers' rooms 8ft. 6in. in height, instead of 7ft. 6in., as provided for in the plans of a school now being built at Leo Street, Old Kent Road.—Mr. H. F. Gibson, from the solicitors' department of the London School Board, who appeared in support of the appeal, said the district surveyor, by the notice he had served, had attempted to bring the teachers' offices and interviewing rooms within the operation of section 78 of the London Building Act; in other words, had attempted to classify them as habitable apartments subject to the statutory requirement that they should be of a minimum height of 8ft. 6in. The rooms in question, which were built on the half-floors of every school, were assigned to the use of teachers partly as an office, partly as a retiring and cloak room, and partly as an interviewing room. It was true that a small kitchener was erected in each, but even that could not be contended to bring them within the definition of an inhabited room.—Mr. T. J. Bailey, architect to the School Board, stated that these teachers' rooms were placed in all the schools built by the Board, and varied from 7ft. to 8ft. in height. That in the projected school at Leo Street would be 7ft. 6in. The only furniture provided were a chair, a table, a lavatory basin, and sets of hat pegs. All these rooms were planned to meet the approval of the Education Department, which, by their inspectors, exercised strict supervision over the use to which they were put.—Mr. Ellis Marsland, the respondent, stated that it was within his knowledge that the teachers' rooms were also used for managers' committee meetings.—The Chairman (Mr. A. Cates) said that, taking into consideration the way in which the rooms were used, the tribunal had decided to allow the appeal, but he must point out that the rooms must be used strictly for the purpose for which the Education Department allowed them to be appropriated.

MR. WILLIAM KENDRICK, M.P., has just lent to the Birmingham Art Gallery his fine example of Sir John Millais's early work, called "The Ransom," painted in 1862, which was No. 30 in the recently closed Millais Exhibition at Burlington House. It represents the interior of a room, with a group of seven persons in sixteenth century costumes. A knight is paying to some robber nobles the price agreed upon for the ransom of his two little daughters, who were left as hostages during his absence in search of the wherewithal to pay his fine. He holds out in his left hand some jewels. On the left stands a page, in blue and white, and on the right an old man with a dog holds the hands of the little girls as they cling to their father.

ÉGLISE ST. MALO, DINAN. THE CHEVET. PUGIN STUDENTSHIP DRAWING, 1897-8.

By CHARLES DE GRUCHY.

MONT ST. MICHEL, BRITTANY. THE MERVEILLE FROM N.E. PUGIN STUDENTSHIP DRAWING, 1897-8.
BY CHARLES DE GRUCHY.

HERR GEORG EBERS, the celebrated author and Egyptologist, draws the attention of Nile tourists and collectors of Egyptian antiquities to imitations of mummy portraits now being offered for sale. Herr Ebers says that the imitations are excellently done, but can easily be distinguished from the genuine by the following process: The genuine pictures are painted sometimes on relatively thick and sometimes on thinner panels. The former are mostly of sycamore wood, the latter of cypress, and were not sawn, but cut to size with a sort of hatchet, which is to be seen on Egyptian monuments, and is still used by Egyptian artisans. In the course of years the wood thoroughly dried. If one makes an incision, the part cut is without exception of a more or less dark brown colour. The forger painted only the edges of the thin panels with that colour, and if a piece is cut off the white ground is seen.

So dissatisfied are artists as a body with the state of the law of copyright as it applies to their works that they propose themselves to draw up a Bill which shall assert their rights more clearly and protect them more effectually. As it is, if a painter, when he sells a picture, omits to retain or assign the copyright, he loses all interest in it, or, to speak more strictly, copyright in that picture never arises. This was so very unsatisfactory that a commission was appointed to examine and report. Its recommendations were scarcely more favourable to the artist. It advised that if at the time of sale the painter did not specifically retain the copyright in the work which he disposed of, then it should pass with the picture to the purchaser. This view the artists consider a decidedly inequitable one, and the main proviso of their Bill will be that the copyright in a work of Art remains with the creator of the work when it is not by him specifically assigned.

THE REV. EVAN JONES, vicar of Strata Florida, is about to build a new church in the village of Pontrhyfendigaid, the parish church, which adjoins the ruins of the famous abbey, being a mile or two away from the village. Some time ago the vicar began to cart stones from the ruins for the construction of the new church, whereupon some objection was raised and correspondence ensued. In his last letter the vicar maintains that he has not exceeded his rights in any way by removing the local stones, but he is willing to waive his rights. He states that he will be most ready to arrange with the church authorities to sell the ruins either to the Archaeological Association, or any other person or persons who would like to buy them, for £2000, to be placed to the credit of the Ecclesiastical Commissioners for the purpose of augmenting the benefice. And now, he adds, those who have any real anxiety about this preservation have a chance to purchase the ruins, and manage them according to their own opinion.

THE London School Board has just adopted a scheme for regulating the work in connection with the alteration and improvement of schools. This states that "the Board has from time to time sanctioned the improvement of the earlier schools by the addition of halls, better cloak-rooms, wider corridors, additional staircases, and so forth. Generally, these improvements have been effected in connection with enlargements, but sometimes the improvements have not involved an enlargement; sometimes they have resulted in a reduction of places. The time has come when the Board should consider systematically and methodically the question of improving its older schools. The Works Committee have furnished a list of twenty-five schools where halls can be added at a moderate cost. On the other hand, there are some of the older schools, especially in the poorer and crowded neighbourhoods, where, from the point of view of education, improvements are greatly needed, although in some cases they would be very costly. It is suggested that the School Management Committee should consult the Board inspectors, and draw up a list of such schools, and that the Works Committee should

be asked to report whether it is practicable to improve these schools, and, if so, at what cost. The Works Committee should also report in the case of all the schools in either list whether it would be practicable to enlarge them, and whether the improvements could be more easily carried out along with enlargement. When all this information was obtained it would be desirable to determine that a moderate sum, say £100,000, yearly, which would involve a charge of £5000 (or £4500 at present rate of 2½ per cent. and fifty years repayment) for interest and sinking fund, should be set apart for the improvement of old schools, and lists might be prepared classing the desirable improvements in proportion to their urgency, in the same way as the Works Committee has done in relation to the improved drainage to the schools. It is probable that, taking one school with another, at least sixteen schools a year could be brought up to date in this way. There are in all 175 schools without halls, which should, sooner or later, be dealt with. Under this scheme they would be taken in hand gradually, and probably all of them—or nearly all—be made suitable in about a dozen years." The Board approve the principles set out in the memorandum, and agree that the sum of £100,000 in the coming year be set apart on loan for the purpose of improving old schools.

At the meeting of the R.I.B.A. on Monday week, Mr. Woodward asked the President if any communication had passed between Her Majesty's Office of Works and the Institute with reference to the proposed new Government offices?—The President: I may say that at present all that has passed is fully confidential, and I am sorry to say I cannot give any information.—Mr. Woodward: Might I ask that, as the Journal of this Institute is the medium of communication between the Council and the general body of our brethren, not only in London, but in the provinces, and in Ireland and Scotland, any of the communications that have passed shall be published in the next issue of the Journal.—The President: In these confidential matters, unless the people who request us to be confidential also request us to make it public we can hardly do so.

THE extensions at the Prince of Wales Dock, Swansea, which have just been opened, were authorised by Parliament in 1894, and the tender of Sir John Jackson, of Westminster, was accepted by the trustees in January, 1896. The works were begun in February, 1896, since which time they have been pushed without intermission. The area of the extension at ordinary spring tide level is 4½ acres, with a depth of water of 28ft. The effective length of quay frontage is about 2000ft. The walls are built of native stone, the masonry being rough rubble faced up to water level with fitted rubble, and above that level up to the underside of the coping with dressed ashlar. The coping is Cornish granite, with the exception of that round the coal hoist piers and on the top of the slag embankment between the two easternmost tips. Cast-iron horn bollards are fixed at intervals all round the walls on the edge of the coping, an arrangement which leaves the crane roads and adjoining lines clear of all mooring ropes. A number of iron ladders sunk flush with the surface of the walls afford ready means of landing from boats. In addition to these ladders, a granite staircase is provided at the north-east corner of the dock. There have been no special difficulties in construction of the extension, the only item to give cause for anxiety being the cofferdam which retained the water in the Prince of Wales Dock, after the end wall of that dock had been removed. This has stood remarkably well, showing no signs of weakness, and keeping unusually watertight, so much so, that a 10in. dia. steam pump working quietly has been able to get rid of all the water making in the ground and passing through the dam from the dock. The works, which cost about £60,000, were designed by, and carried out under the direct supervision of, Mr. A. O. Schenk, M.Inst.C.E., the trustees' engineer.

THE INSTITUTE'S PORTRAITS.

UNVEILING CEREMONY BY ALMA
TADEMA, R.A.

AN interesting ceremony was performed at the meeting of the R.I.B.A. last week, namely, the unveiling, by Mr. Alma Tadema, R.A., of an excellent portrait of the late President (Mr. F. C. Penrose), painted by Mr. J. S. Sargent, R.A. In carrying out the pleasing duty, Mr. Tadema said he considered it a great privilege to be called upon to unveil the portrait of a man whom he esteemed so highly. Mr. Penrose was a man who had pointed out to them that there was life in the straight line of Greek Architecture, that it should be painted to show that there was life in the lines of the brush. With regard to this portrait, he had seen it and admired it, and would continue to do so. Their past distinguished President was one of the architects who helped to restore—he would not use the word "restore," but save—the greatest monument of Architecture from further decay, and to have the portrait of such a President must be a pleasure to all of them; and to have such a good portrait was a matter for great congratulation. They now had such a good collection of portraits, that he would suggest to the Council the advisability of arranging a little gallery, because with such good things they could always appreciate them better when they were put before them in a proper line. He only wished to say that this portrait of their past President was a great addition to their collection, and a great addition to the history of the Institute. In the name of the Committee, he begged to thank Mr. Sargent for the beautiful work he had given them.—Professor Aitchison, in the course of his acknowledgment of the portrait, said their former President was one of the men who conferred dignity upon their Profession, not only by his talents, knowledge, and the advances he had made in the theory of Architecture, but also by his extreme devotion, not only to his own Art, but to the great art of astronomy—he supposed he should call it science. Plato, in one of his dialogues, complained of the architect as one of the people who falsified the realities, and said that instead of making line as it should be, they infused all sorts of delicate curves which did not come within the category of realities. After referring at length to the efforts previously made in the study of Greek Architecture, Professor Aitchison pointed out that Mr. Penrose was furnished with means to go out with his instruments, and said his knowledge of Architecture, and his general attainments, enabled him to show that the delicate curves and the peculiar variations which were so delightful to look upon, were perfectly true, and now he had proved to all time that these delicate perceptions of the Greeks were superior to those of any other nation that had lived. They would all be glad to have this addition to their excellent collection of pictures, this charming work by Mr. Sargent. They must all be grateful to him for giving the Institute so striking a portrait of their President, showing all the refinement, which was so marked, in a man of science and art. The Divine Art, of which Mr. Sargent was so excellent an exponent, made life delightful to all of them. He would hardly like to venture upon saying what he felt upon the Divine Art of painting. It was given to some few who were blessed with this peculiar gift, to hand down to others portraits of the great men and beautiful women; various striking effects in comedy and tragedy and of everyday life; and to give them the lovely views that only existed for one moment in glancing. He again thanked Mr. Sargent for his great gift to the Institute, and he also congratulated the members on having the portrait of so distinguished a man as Mr. Penrose.—Mr. J. S. Sargent briefly acknowledged the compliments, and a vote of thanks was also passed to Mr. Alma Tadema for unveiling the portrait.

Surveying & Sanitary SUPPLEMENT.

MARCH 30TH, 1898.

Reservoir Embankments.*

BY WILLIAM FOX, M.INST.C.E.

(Continued from page xxvii.)

THE DOWDESWELL RESERVOIR OF THE CHELTENHAM CORPORATION WATERWORKS.

THIS reservoir is on the river Chelt, about four miles above Cheltenham, and is situated on the lias clay. The Cheltenham and Banbury Railway follows the hill on one side of the valley in which the reservoir is constructed. At the time the reservoir was designed, in 1882, great trouble had been experienced in the embankments of this railway, owing to the ground under and adjacent to the embankment yielding and the banks slipping. It was therefore evident that unless some unusual course was adopted, difficulties would arise.

The embankment (see Fig. 3) is 730ft. in length, and 39ft. in height to the surface of the ground as it then stood; but this was, in the deepest part, 17ft. above the original surface of the ground, the valley at this point having been the site of an old mill dam, which through disuse had become silted up. Trial holes in this silt showed it to consist of very fine oolitic debris and clay, and a large percentage of water, giving it the appearance of very fine running sand. After the water was drained off, it was naturally much firmer, but it was thought, before it was removed, to be unfit for the formation of the embankment, and it was therefore decided that it should be run to spoil.

The material available for forming the embankment was chiefly lias clay of a very treacherous nature. There was, however, a limited amount of oolitic gravel found within the site of the reservoir, which was available for forming the outer part of the slopes.

The slopes on both sides are at 3 to 1 (see Fig. 4), with the exception of the top 6ft. of the outside slope, which is 2 to 1. The 3 to 1 slope on the inside is taken down to 16ft. below top water level, where there is a bench 15ft. wide. The whole of the toe across the valley to this level is formed of burnt ballast. The outside slope is 2 to 1 for the top 6ft., and then 3 to 1 to 22ft. below top water level. At this level a burnt ballast toe commences, which is kept within the 3 to 1 slope. Beyond the 3 to 1 slope there is a bench formed by the soft material excavated from underneath the base of the embankment. This bench is

* A paper entitled "Reservoir Embankments, with suggestions for avoiding and remedying Failures," read before the Society of Engineers.

TRANSVERSE SECTION OF EMBANKMENT

Fig. 4.

CHELTENHAM CORPORATION WATERWORKS. DOWDESWELL RESERVOIR.

35ft. wide, and terminates against the original ground with a 3 to 1 slope. It was originally intended to burn the lias clay obtained from the inside of the reservoir to form the burnt ballast, but it was found that the silt from the base of the bank, after it had time to drain, burned into excellent ballast, forming clinkers sometimes of several tons in weight. It was burnt *in situ*, thus saving the expense of conveyance to the position where it was to be used.

Although during construction the embankment settled downwards to a considerable extent, there have never been any signs of lateral movement.

The work has now been completed about ten years, and has shown no signs of failure. It may, therefore, be fairly assumed that the precautions taken have been proved to be successful.

MONKSWOOD RESERVOIR OF THE BATH CORPORATION WATERWORKS.

This reservoir is situated partly on the upper lias formation and partly on the oolitic sand, the puddle trench being entirely in the lias clay. Along the centre of the valley (see Fig. 5), across which the embankment has been made, a deposit of oolitic debris and peat was met with, varying in depth up to 17ft. or 18ft. This, of course, was removed on the line of puddle trench, in order to obtain a watertight foundation, and under the outer halves of both slopes of the embankment it was also removed and refilled with rubble stone, to avoid its squeezing and oozing out by the superincumbent weight of the embankment to be placed upon it. In the main puddle trench a few small springs were met with in the lias clay, but these were either cut through or else kept back by cement concrete. Also, in the oolitic sand in the arm trench (see Fig. 6) on the north side of the reservoir, a good deal of water was from time to time met with, although it was, no doubt, to a large extent due to surface water running off the hill side beyond.

The material at hand for the formation of the embankment, although much of it was excellent for puddle, was of a most difficult character to deal with in the formation of the embankment on each side of the puddle. To guard against the possibility of slipping the toe of the inner slope, for a width of about 55ft., and for a height of about 18ft., was formed of dry rubble, which, with the rubble filling below, made a total maximum depth of stone of about 38ft., and a maximum width of about 75ft. The rubble was thus brought to 20ft. below top water level, where it terminated with a berm 20ft. wide. Beyond the outer slope a spoil bank of peat, excavated from the inside of the reservoir, was formed. The material for the embankment was rendered worse by the very bad weather which prevailed during the first winter that the works were in progress. The clay became exceedingly slippery, and the oolitic sand, which was quite dry and easy to handle in summer-time, became almost running sand in wet weather. The difference in the specific gravity of this material when wet and when dry was very marked; a cubic foot, when measured dry and loose, weighing about 63lb., whereas a cubic foot, when wetted and pounded, weighed 116lb. It was in consequence of this that, as the embankment approached completion, there were evident signs that it would not stand at the slopes originally designed, namely, 2 to 1 on the outer slope, and 3 to 1 on the inner slope.

At this time the puddle wall was within a few feet of its full height, and the embankment on each side was practically taken to top bank level, the last 8ft. or 10ft. having been put together with practically no moisture to consolidate it, except the surplus water from that used in making the puddle wall. The consequence was that the puddle, which was much heavier than the earth on each side, settled down to an abnormal extent, and probably squeezed into the earth, causing a

LONGITUDINAL SECTION OF PUDDLE TRENCH

Fig. 5.

slight sign of bulging on the outer slope above the top of the peat spoil bank. This was remedied by bringing some stony material from an adjacent quarry and placing it on the outer slope, flattening the slope to $2\frac{3}{4}$ to 1; but before this had been completed the pitching on the inner slope, just above the rubble toe, also showed signs of lifting. The rubble toe below was unmoved, and, from the form that the pitching took, it was evident that the toe had not moved, but was doing its work by upholding the earth behind it. It was then decided to weight the 3 to 1 slope with rubble. When this was done the embankment was completed without difficulty, although it con-

Surveying and Sanitary Notes.

THE Swansea Corporation has accepted the tender of Messrs. Paterson and Co. for the completion of the Cray Water Works at a cost of £255,747.

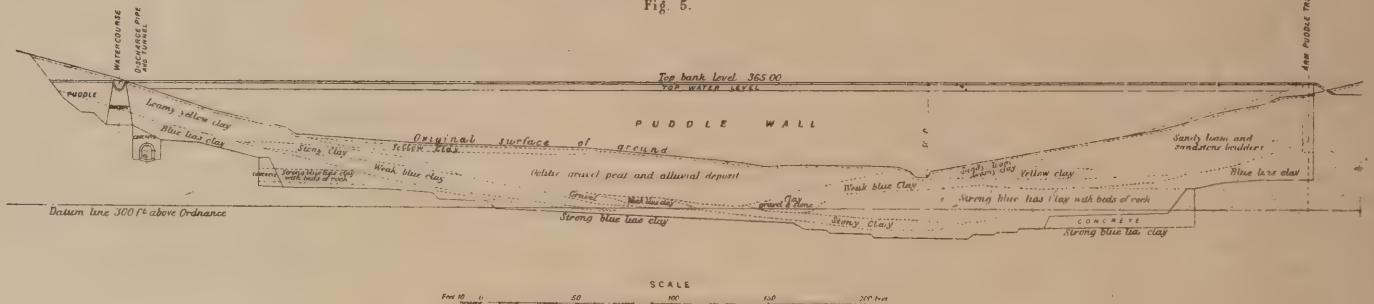

A LOCAL GOVERNMENT BOARD enquiry has been held at York into an application by the Corporation for power to borrow £23,000 for

claiming for dilapidations to property known as Hartfield Grove, Hartfield, under a lease held by the defendant, Mr. Walter Lloyd. At the expiration of the lease a schedule of dilapidations was prepared by surveyors, and tenders solicited. The lowest tender sent in was from Mr. Luxford, builder, of St. Leonards, and amounted to £415. There were, however, other considerations, which brought the plaintiff's claim up to a sum of something over £600. On the other hand, the dilapidations had been estimated by defendant's surveyors at about £200, and another £100 had been allowed for various other things. There is, therefore, a sum of about £300 in dispute.

BATH WATERWORKS MONKSWOOD RESERVOIR

Longitudinal Section of Puddle Trench

Fig. 5.

tinued to settle vertically for some time, and this settlement is probably not even yet completed.

The author attributes these difficulties to the great difference in the material forming the puddle wall and the earth used for the bank, aggravated by the latter being put together practically without moisture. He thinks the surplus water from the puddle only made matters worse, as it was not distributed evenly through the embankment. He is of opinion that in this instance a judicious use of water on the bank might have had a good effect, especially as the slope of the cutting from which the material was taken stands at a slope of $1\frac{1}{2}$ to 1.

THE first sod of a new dock which is to be constructed at Llanelly has been cut. The dock, which is to be nine acres in area, will be 1000ft. long and 400ft. wide, with quays of 1200ft. It will be 17ft. deep on the sill, and the gates will be 50ft. wide. The total cost will be nearly £200,000.

THE Tunbridge Wells Council has adopted a report of the Borough Surveyor in favour of a system of water filtration at Pembury. This very lengthy report pointed out the need of a better system of filtration at the bore hole supply centres, to cost £19,380 18s. 6d. This

sewerage works, £20,000 for the purpose of electric lighting, and £11,852 for street improvements.

MESSRS. BALDWIN-LETHAM, C.E., and W. J. Dibdin, F.I.C., have prepared a scheme for the purification of the sewage of Ashton-under-Lyne by the bacteria process, by which, on a very limited space, an extremely pure effluent will, it is said, be obtained.

THE London County Council received only two tenders for the construction of a new foot passenger tunnel under the Thames at Greenwich. They were Messrs. Mowlem and Company, £119,732; Messrs. Pearson and Sons, £155,000. The tenders were referred to the Bridges Committee.

THE Harbour Board at Cape Town are formulating a scheme for improving the harbour in Table Bay. It is proposed to reclaim some two hundred acres of land near the south arm to beyond the Castle. Here it is hoped to establish immense shed accommodation, offices, warehouses, workshops, and railways; the estimated cost of which is £4,400,000. There is also some talk of building a new graving dock, which would entail the deepening of the entrance to the Albert Basin, the cost of which undertaking is put down at £285,000. In all,

LANCASHIRE sets an admirable example to many counties in the matter of river purification. In 1892, when the much-needed work was taken energetically in hand, pollution was the normal condition of the whole river system. But a vast change for the better has already taken place, and the time seems not far distant when purification will be the rule instead of pollution. At the last meeting of the Ribble Joint Committee, under the presidency of Sir J. T. Hibbert, the report recorded progress as gratifying as remarkable, considering what strenuous opposition from "vested interests" must have been encountered. Sewage interception schemes have increased from six to fourteen, while the number of areas without sewage disposal works has diminished from twenty-two to seven. In 1892 there was not a single authority with efficient disposal works, whereas now no fewer than thirty-one are now so endowed. The broad result of these happy changes is that during last year only four orders were made against manufacturers to desist from polluting streams with refuse, and all of these must have been comparatively trivial cases, as no penalties were applied for.

IN connection with the contract recently entered into by Mr. John Aird with the Egyptian Government, for the construction

Longitudinal Section of Arm Puddle Trench.

Fig. 6.

BATH WATERWORKS. MONKSWOOD RESERVOIR.

would include the purchase of three acres of land for filter beds, works of construction, materials, drainage, machinery, roads, &c. Very soon, with the inclusion of such suburbs as St. Peter's, Langton, and Rusthall, the daily supply of pure water would be quite 700,000 gallons throughout the year. Medical testimony favoured filtration.

the carrying out of the whole scheme of improvements will involve an outlay of some £5,500,000.

IN the Official Referee's Court, London, Mr. Hemming, Q.C., has had before him the case of Melville v. Lloyd. This was an action brought by Mrs. Melville, widow of Judge Melville,

of dams on the Nile at Assuan and Assiut, a vessel of 1000 tons has left England with plant, and surveys have already been made as a preliminary to commencing operations. Sir Benjamin Baker will be the chief engineer in England, and Sir William Garstin will have chief control in Egypt. The dam at Assuan is to be a great masonry structure a

mile and a quarter long, and about 60ft. wide at the base. It will have 130 openings, each about 12ft. by 8ft., to control the water, which will be backed up the Nile over 180 miles, and, when the work is completed, will be allowed to pass through as required. The dam will have a granite foundation throughout. The dam at Assiut will be similar in character, but will be constructed of brickwork (after the fashion of the barrage near Cairo), with foundations raised upon the sandy formation. The area mainly benefited will be that between the two dams, the sites chosen for which are 250 miles apart. When the work is finished the acreage of land available for cultivation will be more than doubled. The construction of the dams will give employment for five years to something like 15,000 native workmen. Contracts have been placed in England for the principal machinery, and many workshops in this country are already busily employed in connection with the scheme.

IN connection with the scheme for the development of Cattewater at Plymouth, the first section of the Victoria Wharves and Pier, which Mr. C. L. Duke is constructing on the foreshore of Deadman's Bay, is completed. Along the sea front Mr. Duke has built a wharf some 180ft. in length, and the other works still in progress comprise a pier jutting out 100ft. into the harbour, a deep-water basin for the accommodation of vessels of large draught, and a smaller basin of shallower depth for vessels engaged chiefly in the coasting trade. Originally it was intended that the pier should be continued to a distance of 300ft. from the shore, but the Cattewater Commissioners objected that it would interfere with the traffic of the harbour, and consequently it was shortened to 100ft. In the light of recent controversy, however, it is interesting to note that the seaward end of the pier, if it had been extended as originally designed, would have projected only some 20ft. further into the harbour than the line Sir J. Wolfe Barry has laid down for the proposed wharves to accommodate the ocean liners. The deep-water basin, now partly excavated, will run back at right angles to the wharf for a distance of 250ft., and will have a depth of water 25ft. at low-water spring tides. The wharfrage on the eastern side of the basin will be 250ft. long, and on the western side, with the pier, 350ft., a sufficient length to accommodate vessels of large tonnage. The smaller basin is being constructed between the Corporation quay and the western side of the pier. The Marine Field has been levelled, and will form a convenient site for warehouses, for which there is ample room. An approach road is being made to the wharves. Railway communication is to be established with the Victoria Wharves by forming a junction with the South-Western branch. The whole of the works have been designed by Mr. H. Victor

Prigg, and are being carried out under the personal direction of Mr. Duke.

A REPORT has been issued by the City Engineer of Norwich (Mr. A. E. Collins), furnishing a summary of the principal work carried out during the past year by the permanent branches of the City Engineer's Department. It appears that there have been 5412 superficial yards of granite sett paving laid during the year, with 2175 yards of granite channel. The sett paving, without concrete foundation, involves a cost of 7s. 7d. per super yard, the channelling costing 5s. 6d. per lineal yard. On the other hand, only 897 yards of wood pavement were laid, the cost per yard of creosoted deal paving, without concrete, being 8s. 4d. per super yard. Thus the new granite work is six times as large as the wood paving, and is somewhat less expensive. As to macadamised roads, there has been a much larger use of broken granite, no less than 50,000 yards of highway having been scarified, coated, and rolled, giving an average thickness of nearly two inches of new granite over the surfaces dealt with. With 2100 yards treated with broken flint, 20,000 yards with road shingle, and 2400 yards with broken stone, the renewal of road surfaces reaches a total of 74,500 yards. It is also worthy of note that 777 loads of roadside scrapings have been utilised as binding material, instead of using marl. In regard to the new tar-paved footways, these—the surface of which is finished with Kentish rag, Derbyshire limestone, and iron slag—show a total of nearly 7000 yards, which have been laid at an average cost of 1s. 10½d. per yard. The report states that a large quantity of clinker is used for the foundation of tar-paving, which can be obtained for the carting, and this takes the place of gravel, which costs 2s. 9d. per cubic yard. Then, 10,700 yards of old tar-paved footways have been refaced, and 226 yards of tar-paved carriage-way has been laid in St. Leonards Road and Duke Street; whilst 1900 cubic yards of gravel have been used for path-making, and nearly 500 super yards of concrete footway have been laid, with considerable repairs to the flagged footways. Not the least important section of the report deals with new streets and buildings, and street widenings have been effected in Fye Bridge Street, Colegate Street, King Street, Waterloo Road, City Road, Bank Street, Upper King Street, Vauxhall Street, Rupert Street, Sayer's Street, &c. A new street has been made continuing Derby Street into Heigham Street. 377 new dwelling-houses have been erected in the year, the total—with additions to houses and factories, and new warehouses and factories—being 450.

MR. H. GILBERT Whyatt, assistant borough surveyor for Salford, recently read a paper, entitled "The present position of the sewage purification problem," at a meeting of the

Sanitary Inspectors' Association (Lancashire and Cheshire Branch) held at the Royal Technical Institute, Salford. After referring to various inquiries made by the Local Government Board upon the subject, Mr. Whyatt said, in Salford experiments had been going on for about ten years, and much time had been spent on various patented processes, chiefly chemical. About five years ago the Committee turned their attention to artificial filters. The first set of six filters were arranged at three heights with a ventilation floor between each twenty inches of filtering material. Two filters were composed of gravel and sand, two of coke breeze, and two of cinders, and very good results were at once obtained from them all. Cinders proved the best filtering medium. The experiment was continued for fifteen months at an average rate of 500 gallons per square yard per day, with very successful results. It was then wished to prove the advantage of a preliminary "roughing" filter and varying degrees of aeration; and this experiment was still going on. The filters were tried at varying rates of flow, and, so long as a filter did not choke up, the effluent was uniformly good. If the filter choked up, it was found that by leaving it idle for a week or two it would recover itself, and again take the sewage perfectly. In 1895 two filters, eight feet deep, were made in order to ascertain whether a deeper mass of filtering material would deal with a larger quantity of effluent, and it was found that while a 5ft. filter would deal with 500 gallons per yards daily, an 8ft. one would deal with 800 gallons. In 1896 the filters were run practically continuously for twelve months at the rate of 1000 gallons per square yard per day, then for a short time at 500 gallons, and now at 700 gallons, the only rest being for a short time daily whilst the small pump supplying them was cleaned. Contrary to expectations, they stood that severe test. In place of the sprinkling troughs spray jets were now used. The surface of the filter was perfectly open, and water was not allowed to collect anywhere. There had been no appreciable growth of the brown sewage fungus since 1895, and the bacterial filters had been protected by a "roughing" filter of fine gravel. Some twenty-five precipitation experiments had been tried, and the effluent of all passed through the bacterial filters with good results. The Corporation had resolved to spend £80,000 in altering the works and laying down bacterial filters, but the Local Government Board had refused its sanction unless the Corporation included a sum to cover the purchase of land over which the filter effluent might be turned and further purified. Mr. Whyatt considered the time had come when the Local Government Board should be roused from its state of "agnostic immobility" and take upon itself to examine whether there was not the efficiency in bacterial filters that was claimed for them.

Constructional Steelwork.*

By T. C. CUNNINGTON.

UNTIL recent years the subject under consideration was generally considered to be within the sphere of the "civil engineer" only, but with the various developments, both in character and in extent of recent buildings and requirements, it has to be seriously considered by the architect. In buildings of the "warehouse" or "factory" class, the construction is comparatively simple. The complication, both as regards loads and construction, arises where the several parts of the same building are occupied by several different classes of tenants and devoted to different uses.

In dealing with a subject of this class, so many points have to receive consideration independently of safety of the building and utility of the various sections for their requirements. Where the interiors of various rooms are decorated, the construction has to be confined within the limits of the proposed treatment and internal Architecture. In City buildings, where space and light are of the most paramount importance, every thought and care has to be taken with the view to limiting the columns, stanchions, girders, and floors to the minimum sections consistent with their carrying power.

In the first place we will consider interior columns and stanchions with their several connections and joints, as upon them depends principally the stability of the superstructure. Interior columns and stanchions form one of the most important steps in the modern problem of design, and greater variations are probably to be found in them than in any other features of steel construction. Each of the several forms has its own adherents, and the many types of connections between the columns and stanchions and with the floor systems permit of an unlimited choice. We will endeavour to investigate the more prominent forms, and point out the advantages and disadvantages of each. The most satisfactory for general and specific cases may then be selected as combining the desired features. The relative advantages of the various sections are of the greatest importance, as affecting economical and successful design. In actual practice the treatment of the different shapes will be found to vary greatly with the designer, not only in the relative value of the sections, but in the treatment of any one section. In the first place the formulae differ greatly, not in fundamental principles perhaps, but in the treatment being often empirical, and containing factors deduced from some special case. These formulae, also, generally assume ideal loading, which seldom occurs in the actual

* Paper read before the Architectural Association on Friday night.

SECTIONS OF STANCHIONS.

building, and none, or very few full-sized tests, have ever been made on the effects of eccentric loading.

The general principles which govern the resistance of built columns may be summed up as follows:

1. The material should be disposed as far as possible from the neutral axis of the cross-section, thereby increasing "R."
2. There should be no initial internal stress.
3. The individual portions of the column or stanchion should be mutually supporting, and
4. The individual portions of the column or stanchion should be so firmly secured to each other that no relative motion can take place, or they will fail as a whole.

From experiments, the closed column and stanchion is stronger than any open one, due to the fact that the edges of the segments are mutually supporting when held in contact by complete closure. Therefore the circular-built column is undoubtedly the most favourable form for compression, because the capacity of columns of equal areas varies as the metal is removed from the neutral axis. It must also be remembered that any form of column or stanchion, having a maximum and minimum radius of gyration, is not economical for use under a single concentric load, as the calculations must be based on the minimum radius of gyration. The metal represented by the excess of the maximum radius of gyration is, of necessity, disregarded, and part of the section is thus lost or wasted when we consider the ideal efficiency of the column; but practice does not always support theory, and many

other questions besides mere form arise in connection with the judicious choice of a section.

The form of stanchions and columns most generally in use is illustrated. You will observe that No. 1 section is made of four angles, rivetted back to back; No. 2, of two T-bars, also rivetted back to back. The caps and bases of these are easily formed by either forging one of the flanges of each bar at right-angles to the stem, or rivetting forged angle-seatings to the stem to receive cap and base plates. In illustrations 3, 5, and 7, these stanchions are made up of angle-bars rivetted together as indicated. The strength and size can be either increased or decreased as circumstances require. The caps, bases, and flange plates of these forms are attached by angle cleats rivetted to the plates, angles, and webs. Bearings for joints or girders at intermediate levels can be readily rivetted either to the web or flanges of them. Illustration No. 4 is made up of four angle bars, with strap bars, say every 4ft., or diagonal bracing suitable to the purpose, to be used either as stanchion or bracing. In illustrations 6, 8, 9, 10, and 11 are shown various sections of stanchions made up of single joists, joists and angles, joists, tees and plates, and joists with one rivetted both sides of web.

The strength of each of the sections can be adjusted either by increasing the size of the joists, or angles and tees, or by the addition of flange plates. The cap and base plates are attached to the shaft by rivetting angle cleats to the webs and flanges to form the requisite bearing surface for the flange plates. In details 12, 13, 15, and 16 are given various sections of stanchions, made up of channel sections and joists, No. 14 being of channels, bars, tees, and plates. These forms of stanchions are applicable for continuing through two or more stories of the building admitting of two or four girder joists bearing at the same level, particularly so the sections Nos. 13 and 15.

Sections Nos. 17, 18, and 19 are made up of flanged quadrant bars, flanged quadrant bars and channels; the diameter of 16 and 19 can be increased and decreased as occasion requires by using smaller or larger sections of channels. Sections 18 and 19, whilst retaining the minimum diameter, can be very considerably increased in strength by adding plain or bulb-shaped tees, plain bulb-shaped angles, or by the addition of plates, either inside or outside of the channel bars.

Section No. 22 is made up of channels and Lindsay's special angles, or plain angles. This particular section was very successfully used in the West Australian Bank, Cornhill. In this particular instance they were 21ft. 6in. long, 11in. diameter, made of four 5in. by 3in. channel bars and four 3in. by 3in. by ½in. angle bars.

In order to suit them to the respective loads

SECTIONS OF STANCHIONS.

the strength of part of them was increased by an additional lin. plate rivetted to the back of the channel on the inside. Two of these stanchions, one the light and the other the heavy section, were tested at Messrs. Kirkaldy's works, and admirably withstood the compressive strain to which they were subjected. Upon the light section 158 tons were applied, and upon the heavy section 237 tons were applied, each of them, together with the caps and bases, being made in the usual manner, that is, without any special preparation for testing. With reference to section No. 16, there is a difficulty in rivetting up these stanchions if of small diameter.

The forms of stanchions shown in sections Nos. 20 and 21 readily adapt themselves to purposes of construction of high buildings, where several floors have to be considered, and supported by the same stanchion. The section can easily be made to suit any number of loads and floors, by either increasing or decreasing the diameter, or increasing or decreasing the sectional area. These sections have found particular favour with the American architects and engineers in the construction of their high buildings from the fact of their easy adaptability to their respective requirements, to their form and construction, and from the fact that they can be readily encased with fire-resisting materials independently of being made up of bars, that are either kept in stock at the mills or can be generally quickly supplied.

The drawn steel columns are made from 4in. up to 24in. diameter and from $\frac{1}{2}$ in. to 1 $\frac{1}{2}$ in. metal in one piece, excepting the flanges forming caps and bases. They are made in lengths not exceeding 21ft. or 22ft., and are generally used in lengths not exceeding in height of one high or two short stories; but when they are superimposed, the single joist girders bear up the flanges, and are attached. When columns of larger diameter are required, and girders either of double joist compound girders or rivetted plate girders are used, the columns are made to seat on the girders, the girders abutting and being continuous, the flanges of the caps and bases being bolted to the girders.

Ornamental caps and bases, either in cast iron or other metal, can be readily adapted to these drawn steel columns, to suit the several styles of Architecture. The great advantage of these columns is that you get the greatest amount of carrying power for the minimum diameter and thickness of metal, and it deserves consideration when space is an object, or where shipment has to be considered. One of these columns was tested at Messrs. Kirkaldy's with most excellent results, the length being 14ft., 7in. diameter, and lin. metal, the calculated safe load being 92 tons. It was tested up to 180 tons, practically without any movement, and no injury was observable to the material under microscopical examination.

Columns shown in details Nos. 23 and 24 are built up of steel plates and T-bars, and curved steel plates for large diameter columns, heavy constructions; or, where they are exposed, their form admits of being increased almost to any diameter and strength. The cap and base flange plates are attached by angles rivetted to shaft, and the flange plates rivetted to the angles. In special cases an additional plate is put on the outside extending from 12in. to 14in. from the ends before putting the flanges on for purposes of additional strength. The steel stanchions combine the principle of the ordinary angle-bar stanchion and the column. The bars are rolled in such a manner as to form a hollow shaft, and placing the metal as great a distance from the central axis as possible. They are made of four bars, or, for additional strength or diameter, plates or bulb bars are inserted between the flanges of the angles. The cap and base flanges are attached to forged bent plates, or angles rivetted to shaft, as the several illustrations show.

These stanchions have been extensively used, as, independently of their strength, comparatively with their diameter and sectional area, also independently of the fact of being easily encased in fire-resisting material, either rectangular or circular shape, to suit the Architect-

ture of the building. The safe loads on these are ascertained by taking one 14ft. long, 6in. diameter, the safe load is 80 tons, and generally, in practice, the full load has been placed upon them, and proved satisfactory. To increase the size of the bases and bearing surface area of the various steel columns and stanchions referred to, to provide for heavy or extreme loads, they rest upon cast-iron bases, formed to suit each special requirement. The cast bases may either rest upon joist foundations or upon adequate stone bases and concrete foundations, the columns and stanchion bases being bolted down to the cast-iron bases.

THE FIREPROOFING OF COLUMNS AND STANCHIONS.

As columns and stanchions carry the greatest concentrated loads found in modern buildings, the proper fireproofing of these becomes a most important subject for consideration; unfortunately, in only too many cases is this slighted or omitted, even to a very dangerous extent, as has been proved in numbers of instances.

Many systems have been introduced, and both the "hard tile," the "porous tile," "terra-cotta," and concrete have been used extensively.

The requirements in the adequate fireproofing of columns and stanchions are:—

1. The material must be indestructible by fire.
2. The material must not be heat-conducting.
3. The material must be so secured to the columns or stanchions that it cannot be dislodged.

The use of hard fire-clay tiles is only to be recommended when such tiles are hollow with a sufficient and proper air-space around the metal column or stanchion, and even then experience seems to show that the hard tile is in no way so satisfactory under great heat as the porous tile. Application of cold water in combination with heat have also proved the hard tile far less reliable in case of conflagration than the porous tile, as the hard tile is very apt to crack off under such conditions. The use of solid blocks of porous tile well bedded against the metal column or stanchion or solid pumice concrete seems to be the most highly satisfactory.

The requirements for fireproofing the interior columns and stanchions by the Chicago ordinance are defined as follows:

1. "The coverings for columns or stanchions shall be, if in brick, 8in. thick; if of hollow tile, one covering at least 2 $\frac{1}{2}$ in. thick.

"If the fireproofing is made of porous terra-cotta, it shall be at least 2in. thick, whether hollow tile or porous terra-cotta is used, the courses shall be so anchored and bonded together as to form an independent and staple structure."

2. "In all cases there should be on the outside of the tiles a covering of plaster with Portland cement, or of other solid cement of equal hardness and efficiency when set."

3. "If plastering on metallic laths be used as fireproofing, it shall be in two layers, of which the first shall be applied in such a manner that the concrete or plaster will cover

the entire external face of the column or stanchion, while the space between the two layers shall not be less than lin.

"The metallic laths shall in each case be fastened to the metallic firings and the plastering, upon same shall be made with cement."

FOUNDATIONS FOR COLUMNS AND STANCHIONS.

In designing the foundations for columns and stanchions for a building, where they rest upon a yielding stratum, proper provision must be made for the uniform distribution of the weight. In cases where the loads vary the foundations should be proportioned according to the different loads, so that the bearing per unit of ground area will be equal, and a uniform settlement of the structure assured. Where the loads are excessive an excellent foundation for columns and stanchions can be formed with rolled steel joists, either in a single bed or more, the foundation for them being prepared by a suitable bed of Portland cement concrete of ordinary depth, then placing the joists thereon.

Where unusual loads are to be supported the joists may be crossed in two or more directions, each at right angles, their distances apart from centre to centre varying from 9in. to 24in., according to circumstances—i.e., length of their projection beyond the masonry thickness of concrete, estimated pressure per square foot, &c. They, however, should be placed at least far enough apart to permit the introduction of concrete filling between the joists.

The most useful application of this system of foundation is on sites where a thin and comparatively compact stratum overlies another of a more yielding nature. By using joists in such cases, the requisite spread at the base may be obtained without penetrating the firm upper stratum or carrying the footing courses down to an unusual depth. In covering the joists with concrete, 6in. should be left at the ends and sides of them and 1 $\frac{1}{2}$ in. to 2in. on top. A convenient way of doing this is to make a plank frame of the same size as the concrete bed, and at the proper height and perfectly level; after this is filled it is made for the next courses and so on, the whole exterior rendered with Portland cement, so that no metal is exposed.

The method of calculation for joists used in foundations may be stated thus:—

The arms or projections of the two lower courses are fixed by the lengths of the upper ones, and by the dimensions of the sub-soil area, hence the question is how many joists are required.

Let y = projecting arm of any course.

a = width of supporting area.

L = total load on footing.

M = bending moment on one side of layer.

Then the length of joist = $a + y + y = a + 2y$.

Load on $y = \frac{Ly}{a + 2y}$ and since the distribution

of the load on every layer is uniform, we have

$$M = \frac{Ly}{a + 2y} \times \text{lever arm} = \frac{Ly^2}{2(a + 2y)}$$

In calculating the lower course, y becomes a known quantity and M an unknown.

SECTIONS OF COLUMNS.

The usual spacing where three tiers are used is

- 15in. for lower tier.
- 12in. for middle tier.
- 9in. for top tier.

For any other spacing of pressure than given, M can be found from the formula

$$M = P \sqrt{\frac{sb}{12}}$$

When P = the projections in feet for the several tiers of beams.

b = the allowable bearing capacity per square foot of ground in tons.

s = spacing in inches.

The method in regard to the calculation of such footings is still an unsettled question, as some engineers claim that the action of the concrete filling with its tendency to bind the iron and concrete together causes the foundation to act as a whole, and thus possess a moment of resistance much greater than the sum of resistance of the individual layers.

But in view of the uncertainty of such assumption, the method of calculating all movements about the edge of the casting would seem more logical, as well as being on the safe side.

To illustrate this class of footings, one, 15ft. 6½in. square base, was used in the "Marguerite Building," Chicago, for a load of 410 tons. The base of cast iron is 3ft. 6in. by 4ft. resting upon five 20in. joists 100lb. per foot each and 14ft. ¾in. long.

These 5in. joists rest upon fourteen 15in. joists 41lb. per foot each.

The other, with base 15ft. 6½in. by 19ft. supporting two stanchions, is in the same building. The load on one stanchion is 181 tons 8 cwt., and the other 250 tons 16 cwt. Under the cast bases, which are 3ft. 6in. square, are five 15in. joists, each 80lb. per foot, and five 20in. joists, 80lb. per foot, under the cast bases, supporting the light and heavy loads respectively. Underneath these, at right angles, are fourteen 12in. joists, 17ft. 6in. long, resting upon the concrete foundation. In determining the sizes of the joists in any layer, care must be taken to leave sufficient clearance between the flanges to admit of the concrete being rammed in place. Hitherto this class of foundation has been but little used in this country, although it has been used in several isolated cases. In Messrs. Jones and Higgins's warehouse, Peckham, it was very successfully used. A modification of the systems lends itself readily as foundation for columns, stanchions, and piers for buildings, or corner sites, or where the site of the building is of such a nature as necessitates the system being used.

It has been used in the construction of the new premises in the Strand, at the corner of Adam Street. In this instance the joists are framed 3in. or 4in. wide, and rest upon the solid concrete foundation, substituting the usual piers and footings for the front walls. Another instance is in the building of some flats at Tufnell Park. In this case it was not considered advisable, from the nature of the site and the great expense, to take the walls down to the requisite depth for foundation.

Piers about 4ft. square, in Portland cement concrete, were taken down to the solid strata, and upon these piers a framework of steel joists was built, properly fitted and connected together to carry the external and principal internal walls. By this method it will be inferred there is little or no possibility of any one part of the wall subsiding without affecting the general structure.

The foundations, basement columns, &c., are either surrounded by constant moisture or by the wet clay or earth itself. For such positions cement mortar should undoubtedly be used, as from experience it seems the most perfect conservator of metal work.

Of all the ruined castles in Wales, Pembroke is one of the fairest and most majestic. The round tower or keep is a splendid structure, rising cloudwards above the ivy wreaths that cling around its walls, which are 7ft. thick. The banquet hall, the chapel, and the broad courtyard remain to prove the former dignity of the Castle.

Professional Items.

BARNSTAPLE.—A Local Government Board inquiry has been held at Barnstaple relative to an application for sanction to borrow £1677 for a new steel swing bridge over the Yeo at Braunton Road. Mr. Frank Chanter is the engineer.

BIRMINGHAM.—Deritend Branch Library has been opened after extensions. The building has been extended a third by the addition of another bay; the roof has been lowered and the lighting greatly improved; mullioned windows look out upon the street. New furniture has been put in, the walls have been hung round with Arundel Society prints; an efficient system of ventilation has been devised, and a pitchpine floor laid down.

BLACKPOOL.—The foundation stone of a new Liberal Club at Blackpool has been laid. The cost of erection (including the amount paid for the site) will be about £7000, and another £1000 is to be spent upon furnishing.

BOLSOVER.—The old chapel in Cotton Street, and house adjoining, are to be sold, and a new chapel and school and class rooms erected. Plans, &c., have been prepared by Mr. W. J. Morley, of Bradford, and tenders have been accepted from Mr. Oakley, of Bolsover, for mason and brick work, plastering, and slating; from W. Wilson and Sons, of Castleford, for joinery; Messrs. Aves and Houghton, of Mansfield, for plumbing; and Mr. Harland, of Bradford, for painting. The expenditure will be £1800.

CLIFTON.—The Clifton Grand Spa and Hydro has just been opened. The baths have been designed and carried out on lines approved by the late Dr. Hunter, of Smedley's, Matlock, by Messrs. Harper and Harper as architects, and Mr. G. Croydon Marks, C.E., as engineer.

DUBLIN.—An appeal has been made for the improvement of the organ in St. Patrick's Cathedral, to bring it up to date. Mr. Drew, the Cathedral architect, gives his opinion that St. Patrick's Cathedral plan lends itself to such addition as is the reasonable outcome of organ requirements of the nineteenth century, without prejudice to its present perfection of geometric plan and design. He proposes to submit to the Dean and Chapter and Cathedral Board a scheme which may confidently challenge the criticism of architects at large as a fair and reasonable departure in connection with an ancient and historic building. There could not be in principle any inconsistency in erecting in this century buildings in architectural harmony with the old ones on the site, as the Cathedral architect points out, of a vanished Chapel of St. Lawrence, one part of the whole group, and on the site appletted by Archbishop Comyn in 1190 for a treasurer's house, and occupied by it from his time until 1869.

GLASGOW.—Mr. Dobson's High School students, on Saturday last, paid a visit to Ruchill Hospital. The hospital comprises sixteen pavilions, accommodating 408 beds, with acute wards and convalescent wards in addition. The total cost per patient is about £500. The hospital also provides administration block for nurses, doctors, and matrons' rooms, with recreation hall. The buildings are now ready for joiners' finishings, but the contract for the machinery, boilers, and water tower, which is 160ft. high, is still to proceed. The total cost is estimated at £230,000.

GOWERTON.—The new Intermediate and Technical School at Gowerton is well-situated on an elevated piece of ground. The structure is in the Gothic style, and contains an assembly hall, 42ft. by 22ft. clear, four classrooms, cookery room, music room, laundry, manual workshop, chemical laboratory, chemical lecture room, with the usual private rooms for the head-master, head-mistress, and caretaker—affording accommodation for about

120 students. It was designed by Mr. T. P. Martin, Swansea, and has been built under the supervision of Mr. R. S. Griffiths, Tonypany, consulting engineer to the Technical Instruction Committee of the Council, by Messrs. Bennett Bros., Swansea, with Mr. John Lloyd as clerk of the works.

LEEDS.—A home and schools for blind and deaf children is now being erected by the Leeds School Board in Blenheim Walk, off Woodhouse Lane. The building, the plans of which have been prepared by Mr. W. S. Braithwaite, will cover an area of 1200 square yards. The design—a free treatment of the Gothic style—is intended to illustrate the collegiate character of the institution. The structure will be three stories high, with the addition of a good part basement, well lighted from wide areas, and a sub-basement for the special heating and ventilating arrangements. The building has been specially and very carefully designed to meet the requirements of the two departments—the blind and the deaf, and is in this respect unique in character. Each department will be separate and distinct in its working for scholastic purposes, and will be easy of approach from the domestic department. To this end, five separate staircases, leading direct from the ground floor to the top story, are provided. The heating and ventilating will be carried out by Mr. Key, of Glasgow, on the principle in use at Darley Street and Hunslet Lane. The total area of the building is 5000 superficial yards, and it is estimated that, together with the site, it will cost £28,000.

LEICESTER.—At a special meeting of the Town Council at Leicester, the Chairman of the Finance Committee announced that the Council had voted no less than £160,000 for street improvements alone during the past twenty-eight months; had devoted £230,000 more during the same time to the acquisition of parks, lunatic asylum, cemetery, baths, &c., and had furthermore spent £183,000 on the extension of the gas and electric lighting plant, making the huge aggregate of £573,000. At the same meeting special committees were appointed to consider the expediency of acquiring the Leicester tramways, and erecting a block of two-story buildings for the housing of the aged poor at rentals not involving any charge upon the rates. It was also decided to spend about £6200 on the maintenance of the Municipal Technical and Art Schools.

LIVERPOOL.—A new home for the nurses at the Brownlow Hill Workhouse is being erected. The estimated cost of the home, which will allow of the residence of sixty nurses, is £11,350, inclusive of furniture and fittings. The building, which has been designed by and erected under the supervision of Mr. Henry Hartley, of Bristowe Chambers, 8, Harrington Street, Liverpool, comprises basement, ground, first, and second floors. The basement contains a dining hall at the west end 51ft. 6in. by 29ft. 6in., with lavatory, cloak-rooms, and service-room immediately adjoining. On the ground floor there are two large sitting-rooms, one 30ft. by 24ft., and the other 30ft. by 28ft. Arrangements have been made whereby the partition between the two rooms can be readily removed, being constructed with Stone's patent sliding shutters. Thus a room 52ft. by 30ft. can be formed for lectures or other purposes where meetings of the nurses are required. On this floor there are also lavatories, matron's room, and eighteen cubicals, or bedrooms. On the first and second floors there are fifty-six bedrooms, with the necessary linen closets and storerooms. There are bathrooms on each floor. The lavatory arrangements are confined to a sanitary tower on the south side of the building, which is practically isolated from the main building by a ventilated corridor. The general arrangement of each floor is a central corridor 6ft. wide, with the various cubicals or bedrooms and other apartments leading off right and left. At each end of the building is a stone staircase communicating with the various floors, and approached from the hospital side by external entrance. The new home has

communication on the ground and first floors with the existing Nurses' Home by means of a glass-covered corridor; so that the whole nursing establishment, which in all will accommodate about 100 nurses, is brought into direct communication. The walls of the bath-rooms, lavatories, and domestic offices are lined with white-glazed bricks. The building throughout will be heated with hot water, the heating chamber being at the lower part of sanitary tower. Radiators are fixed in the corridors at intervals on the several floors. Special attention has been paid to the ventilation of the building. Although the cubicals are self-contained by walls, the door openings have been carried up to the ceiling, and the upper portion filled in with moveable fan-lights, which will act as ventilators into the main corridor. The vitiated air will thus be carried into the main ventilating system. The whole of the premises are lighted by electricity. The style of the exterior is plain, and harmonises with the main workhouse structure.

LOWESTOFT.—The foundation-stones have been laid of the new Baptist Church on London Road, Lowestoft. The plans, which are the design of Mr. G. Baines, of Lowestoft, and Clement's Inn, W.C., show an elevation of ornate appearance, being in the Gothic style, simply treated. The front will be of splint flints with white brick dressings and red brick gables. The new building provides accommodation for nearly 700 persons. The seats are arranged on a semi-circular plan, so that all hearers will directly face the minister. There will be a nave and aisles, divided by red granite columns with carved stone caps, moulded stone bases; brick arches and clerestory windows above. Two vestries are provided on the ground floor, and a class-room over the south-west lobby, with cloak-room beneath. The pulpit will be of carved stone, in keeping with the general character of the building. The internal dimensions of the chapel are—width, 49ft.; length, 74ft.

LYTHAM.—The new clubhouse of the Lytham and St. Anne's Golf Club has been opened. The Gothic clubhouse has cost approximately £8000, and the furnishing an additional £2000. The house comprises handsome entrance hall, locker rooms, club rooms, dining hall, ladies' club room, and dressing rooms, billiard room, baths, lavatories, offices, and steward's service.

MIDDLEWICH.—The foundation-stone has been laid of the custodian's cottage in connection with the new technical schools and free library. Mr. Worth is the architect, and Messrs. Clarke and Son the builders.

MOSELEY.—A memorial window has been placed in the chancel at the Oxford Road Baptist Church, Moseley. The window, which consists of two lights and tracery, has been treated by the artist in late fifteenth-century style, to harmonise with the large window in the north transept. The subject illustrated in the first light is the finding of Christ in the Temple. In the second, Christ is receiving and blessing little children. The Temple, as well as all the details, have been taken from Holman Hunt's great work illustrating the subject. The work was intrusted to J. Hardman and Co., of Birmingham.

MOUNTAIN ASH.—The foundation stone has been laid of the new Workmen's Institute at Mountain Ash. The plans have been prepared by Mr. Dan Lloyd, Aberbeeg, Mon., late of Mountain Ash. The contract is in the hands of Messrs. C. Jenkins and Sons, Porth.

NEWCASTLE.—Plans of a new improvement scheme for Newcastle have been designed by Mr. Thos. Hanning and Mr. C. T. Marshall. The scheme embraces a new high level bridge across the Tyne, carrying railway lines and roadways, with improved railway connection on both sides of the river, and also street improvements associated therewith both in Newcastle and Gateshead.

OADBY.—A new Baptist chapel has been

built at Oadby. The building occupies a site adjoining the Leicester Road. It is in the Gothic style, and when completed will accommodate about 400 people. Below the chapel is a schoolroom for Sunday-school purposes. The total cost will be over £2000. The architect is Mr. G. Brown.

PUDSEY.—Plans have been prepared for a new Conservative Club. They show a building in the Renaissance style of Architecture, with an imposing and extensive frontage to the main street. The building, together with the furnishing, is estimated to cost about £4000. The plans have been prepared by Messrs. Holton and Fox, of Dewsbury.

RUSHDEN.—The large additions to Messrs. Cave's factory are rapidly nearing completion. Messrs. Moseley and Anderson, of Northampton, were the architects for the work, and the contractor was Mr. Robert Cosford, of Northampton, the contract price being £7700.

STRANORLAR.—The altars which have been erected in the Catholic Church of Stranorlar by Messrs. O'Neill and Company, Brunswick Street, Dublin, are fine specimens of the sculptor's art. Standing beneath a richly fluted window is the high altar. Under the altar table is a recumbent figure of the dead Christ after the model of John Hogan. It is of Carara marble, and is flanked by carved panels of the same material. Forming a reredos, and extending to a considerable height, on either side of the altar, is an arcade of Sicilian marble, with panels bearing suitable religious mottoes. The chief feature of the altar is the throne above the tabernacle, which rises to a good height, and is gabled, crocketed, and ornamented in a more florid style than the rest of the altar. Side altars, dedicated to the Blessed Virgin and St. Joseph, are situated in each aisle.

STRANRAER.—The Ivy Place United Presbyterian Church, just opened, is built on the site in London Road formerly occupied by the old church. The new building is designed in late decorated Gothic style, the walls being built of dark blue dressed whinstone, with hewn work of a cream white stone from Prudham Quarry, Northumberland. The main gable faces the street, the principal entrance being in the centre by a wide double doorway with richly moulded arch, and tympanum filled with sunk panelling. On each side are mullioned windows with traceried heads lighting the vestibule. On the western side of the main gable the gallery staircase is carried up in an octagonal tower, the lower stages of which are kept very plain. In the upper parts the angles are marked by boldly moulded shafts, and the upper or belfry stage has an arcading of deeply moulded openings with cusped traceried heads. This turret is roofed with a steep conical roof, covered with red tiles, and finished with a crocketed lead finish and wrought iron vase. The side elevations are in keeping with the front, having a series of two-light windows in the lower portion and large four-light windows with traceried heads in the upper, the windows next pulpit end being carried up to a much higher level under transept gables. In the interior the church is divided into nave and side aisles by stone piers and arches; the piers also carrying the galleries which are placed behind them at the sides, and supported on steel girders. The pulpit window has been designed and executed by Messrs. Stephen Adam and Son, Glasgow. The large five-light front window is a beautiful specimen of stained glass art by Mr. Joseph Miller, Glasgow. The total cost of the church, exclusive of the gifts mentioned, will be about £4000. The work has been executed by the following contractors: Mason, D. Purdie, Stranraer; wright, D. Milligan, Ayr; plumber, J. Johnstone and Son, Glasgow; plasterer, James Torrance, Stranraer; slater, Wm. Auld and Son, Ayr; glazier and painter, S. Kemp, jun., Hamilton; heating, Mackenzie and Moncur; gates and railings, McCallum and Hope; gasfitting, Milne and Son; and upholstery, Francis Smith, all of Glasgow. The architect is Mr. John B. Wilson, Glasgow.

Views and Reviews.

STANFORD'S MAP OF METROPOLITAN RAILWAYS.

An excellent map of the metropolis has just been published by Edward Stanford, 26 and 27, Cockspur Street, Charing Cross, S.W. In size, 40in. by 27in., and with a scale of two inches to the mile, it clearly defines the whole of the railways and tramways throughout the metropolitan area, the routes of the new lines now in course of construction and those for which Parliamentary sanction is sought, also being prominently marked. All the streets and thoroughfares are shown, and the principal are named, and the map is one that should prove of great service to architects, surveyors, &c. Evidently much care has been bestowed upon the work to ensure accuracy and clearness. The map is published at three prices—6s., 10s., and 12s.

Under Discussion.

GEOLOGY AND ENGINEERING.

Before the Institution of Civil Engineers, Professor Boyd Dawkins lectured on the "Relation of Geology to Engineering." The two, he pointed out, were so intimately interwoven that sometimes it was impossible to separate them. The structure of the earth ought to form an essential part of the education of a civil engineer. Geology stood to engineering in the same relation as faith to works. The success or failure of an undertaking depended largely upon physical conditions falling within the province of geology, and the works of the engineer should be based on the faith of the geologist.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

The annual meeting of this Society was held at the Albert Hall, Leeds. Mr. George Corson, who occupied the chair, was re-elected president, and Mr. Tweedle and Mr. T. Butler Wilson were appointed vice-presidents. The members elected to the council were Messrs. Hobson, Braithwaite, France (Bradford), W. Carby Hall, Bevers, C. B. Howdill, G. W. Atkinson, and A. E. Kirk, together with Messrs. E. Birchall, W. H. Thorpe, E. J. Dodgson, Perkin, Bulmer, and Watson (Wakefield). Mr. F. W. Bedford was re-elected secretary.

WOOD CARVING.

Lecturing recently at Carpenters' Hall on "Wood Carving—Its Design and Practice," Mr. Lewis F. Day, lecturer and examiner on design and kindred subjects at South Kensington, spoke of the necessity of the designer and the artificer working harmoniously together. The ideal artist was he who could carve out his own designs, but such men were scarce. They would generally find two men associated upon a piece of work, which to be perfectly successful must be produced by unity of feeling between them, and no desire on the part of one to "boss" the other. As to the carving itself, Mr. Day emphasised over and over again the necessity for simplicity, which it was a great mistake to undervalue. It was also a mistake, he declared, to labour after effect. As soon as work ceased to tell, it was time to stop. No amount of work beyond that point would add "finish," but, on the contrary, would detract from it. Duffers, of course, might like to efface the mark of their tools, but when they were expert in the use of them, the marks would add a characteristic texture to the work which was the glory of wood carving. A multitude of splendid examples of beautiful effect gained by least labour were at this juncture shown by means of lantern slides. Proceeding, Mr. Day expressed the opinion that the carver must "treat" his subjects, and could not submit them directly as they appeared in Nature. The history of the art itself, and the character of the medium necessitated that, a remarkable instance of the potency of the

latter being the superiority of panelling over all other forms of wood carving. To design appropriately, one must bear in mind that this class of work was the most suitable and effective, because it was the most natural, being suggested by the shape of the trunk of the tree.—A series of instructive pictures of a carver progressing through the various stages of a design told their own tale when thrown upon the screen, and interior views of noted work at the Honourable Society of Gray's Inn and in the Charterhouse were shown to illustrate how effective even crude work was when properly used.

HAMPSTEAD ANTIQUARIAN SOCIETY.

This Society, which was established last year, has already secured considerable support from residents interested in architectural and archaeological subjects connected with the Hampstead district, which abounds with landmarks of historic value. In these days of suburban building extensions there is a great necessity for the protection of ancient buildings and places of interest from needless violation, and it is not therefore a matter for surprise that architects, artists, and antiquaries should endeavour to combine for the purpose of using their influence to prevent vandalism. Amongst those supporting the movement are:—Sir Walter Besant, M.A., F.S.A., Dr. Brooke Herford, Messrs. Henry Clarke, J.P., L.C.C., Gilbert Dalziel, Frederick Haines, F.S.A., Karl Blind, A. Ridley Bax, F.S.A., Cecil Clarke, George H. Bibby, F.R.I.B.A., and Mr. Charles J. Munich, F.R.Hist.S., who is honorary secretary and treasurer of the Society.

THE SCIENCE OF ENGINEERING.

The seventh annual dinner of the Newcastle Association of Students of the Institution of Civil Engineers was held a few days ago at Newcastle. Sir John Wolfe Barry, K.C.B. (President of the Institution of Civil Engineers), occupied the chair, and responding to the toast of the evening, said the profession of a civil engineer was one of the most responsible, honourable, and onerous of all the professions; and he was quite sure that the younger members would recognise that, to put it on its proper basis, and raise it to its proper status among other professions, it was necessary that the entrance to it should be made like that to other learned professions, by means of an examination, which would give every man who passed it proper credentials. In the future, they would have to grapple with new problems of all kinds, and it was essential that members of the profession should be equipped for the battle as well as the young men in other countries. They ought not to be behind foreigners in the matter of knowledge. It could not be thus without a full scientific examination. He did not wish to put too high a value upon scientific education or examinations, but he would not belittle them. In civil engineering work, they required both practical and scientific training, and no civil engineer in the future would be properly equipped for the battle of life without scientific education and practical experience. The change that had been made must tend to the good of the profession at large. The Institution was in an extremely flourishing condition. He did not think that there had ever been a time when the Council was more in touch with the members in all parts of the world than it was at present. He thought they might look forward to a prosperous career for the Institution. He also thought that the profession was in a good condition. Although they heard complaints of want of work from time to time, he did not think it was pressing upon them greatly at present, and not nearly so hardly as upon some other professions. At no time in his career had the civil engineering profession or the Institution been in better condition than at present.

A NEW church, to seat about 700 persons, is about to be erected at Abertely (Mon). The architect is Mr. C. B. Fowler, F.R.I.B.A., of High Street, Cardiff.

Enquiry Department.

CUBING TIMBERS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would you, through your Enquiry Department, show me the correct way to cube timber, viz., 4in. by 4in., 9in. by 2in., and 2in. by 4in.—Yours, G. F. P.

To find the cubic contents of sided timber, multiply the three dimensions together continuously, for instance, the contents of a deal 12ft. long by 9in. by 2in. would be found thus: First reduce the 12ft. to inches, viz.,

$$144 \times 9 \times 2 = 144 \text{ in.} \times 9 \text{ in.} = 1296 \times 2 = 2592 \div 1728 = 1\frac{1}{2} \text{ cubic feet.}$$

The number of cubic inches in a cubic foot is 1728. The rule generally employed to find solid contents of rough hewn timber is: Take half the sum of breadth and depth, in the middle of length, square this half sum (i.e., multiply it by itself), and multiply by the length; but if very irregular or crooked, take the girth at several points, add together and divide by the number of measurements, for a mean girth which multiply by the length, taken straight from end to end.

TENDENCIES IN ART.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The "chapel somewhere Clapham or Wandsworth way, by Philip Webb"—referred to in the editorial note to the letter of "Design," in last week's BUILDERS' JOURNAL—is attached to Lady Adeline Smithers' Deaconesses' Home, on the south side of Clapham Common. You have omitted two of Philip Webb's works in London which are readily accessible to the student—Mr. Val Prinsep's house, 1, Holland Park Road, Kensington, adjoining Lord Leighton's house, and the group of offices, No. 19, Lincoln's Inn Fields, sandwiched between the Equity and Law Life Assurance and the Inns of Court Hotel. The Saturday Review recently suggested Mr. Philip Webb should be made a Royal Academician, but it is to be doubted whether Mr. Webb would think this a compliment, or that he would accept the honour if it were offered him. Mr. Webb, like the hero of one of Kipling's ballads, "doesn't advertise," and would probably be content to live and die, like the French poet Piron, "pas même académicien."—Yours, J. H.

LIMEWHITING IRONWORK.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Can you kindly inform me of a medium for the preparation of a recently painted cast-iron surface to take limewhite? Do you think size thickened with finely-ground whiting would be effective?—Yours truly, B. F. C.

A good binder for the purpose mentioned is boiled linseed oil, in the proportion of 1 of oil to 10 of limewash; to quicken the drying 2 of patent size may be added—not more, as it has a tendency to flake off. The above proportions depend upon the quality of the lime, and it will be advisable to test a small portion before mixing a quantity. If it is not compulsory for sanitary reasons to use quicklime, whiting will be found to make the best wash; it is more easily applied, covers better, and is not so destructive to tools. If the latter lime is used, substitute borax for the boiled oil; select a dry or warm day for the application, as if condensed water is enclosed by the coating, it will eventually swell, and blister off the white-wash.

THE will, dated July 18th, 1896, of Mr. Charles John Shoppee, F.R.I.B.A., of John Street, Bedford Row, and 41, Mecklenburgh Square, who died on November 18th, has been proved by Mr. Charles Herbert Shoppee, the son, and Mr. Robert William Dibdin, of 23, Red Lion Square, the executors, the value of the personal estate being £8362 0s. 5d. gross and £6683 4s. 3d. net. He gives all his architectural books to his son, and 20 guineas to Mr. Dibdin. Subject thereto he leaves all his property upon trust for his wife, Mrs. Elizabeth Shoppee, for life, and then to his son absolutely.

Trade and Craft.

MESSRS. WYCKOFF, SEAMANS, AND BENEDICT.

MESSRS. Wyckoff, Seamans, and Benedict, makers of the well-known Remington Standard Typewriter, have opened a West End branch establishment at 253, Oxford Street, W. The growth of the business has necessitated this step. The firm has recently introduced new foolscap and brief models to increase the scope and general efficiency of their machines.

LEEDS INFECTIOUS DISEASES HOSPITAL.

In the competition recently decided for the best scheme of warming, ventilation, etc., for the new Infectious Diseases Hospital, Leeds, a Liverpool firm has proved successful, their scheme and tender having been formally adopted by the Corporation of that City. The successful competitors are Messrs. Dargue, Griffiths, and Co. Limited, of 15, Lord Street, Liverpool, who, a little more than a month ago, were awarded the first premium for a similar scheme at the new Edinburgh Infectious Diseases Hospital, Colinton Mains. This success is a tribute to Messrs. Dargue, Griffiths, and Co., who were in competition with firms of the highest repute.

PALMER'S PATENT TRAVELLING CRADLE.

In the painting and redecoration of buildings, bridges, and various structures, the task has often been rendered not only difficult but very dangerous owing to the want of some apparatus from which the workmen could perform with safety and efficiency. This want appears to have been supplied by Mr. Edwin Palmer, of 250, Westminster Bridge Road, S.E., who is the inventor and furnisher of a Patent Wire-Supported Travelling Cradle, which has already been extensively used with successful results. The platform, or cradle, upon which the workmen stand is about 6ft. in length, and is suspended from a wire rope at the top of the building or in any other position, and being slung on pulleys, the men can easily run it along to the required place as the work proceeds; and, of course, it can be raised or lowered as occasion demands. By this simple yet effective arrangement the necessity for a lot of scaffolding or a number of ladders is entirely obviated, thus economising time and expense. It should be explained that the men on the cradle have thorough control over the apparatus, and without any aid can, by means of the ropes and pulleys, fix themselves in any position. In order to ensure safety, the wire rope used is tested to carry eight tons, although the weight of the apparatus, including two men with it, is less than four hundredweight. Palmer's patent travelling cradle was employed in repainting Southwark Bridge, where it was fixed over the central arch, a span of 250ft. It was also used at the Hibernia Chambers, London Bridge, on a stretch of 96ft., to repair a cornice.

JARRAHDALE JARRAH.

This wood paving system has grown to be exceedingly popular, which says much for its durability. A pamphlet published by the London Agency, at No. 1, Fenchurch Avenue, E.C., contains some interesting particulars on the subject. Jarrahdale Jarrah comes from the tree Eucalyptus Marginata, found in abundance on the Darling Ranges of Western Australia, and the proprietors of it hold 250,000 acres of forest from which to produce their supply. Figures are given to show that Jarrahdale Jarrah holds the premier position, both for quantity and durability, above other kinds of timber found in the locality. It has already been very extensively used, not only in Australia, but in England and other countries. Several of the main thoroughfares in the metropolis have been paved with it, and experts have expressed opinions entirely in its favour. Particular note has been taken of the material laid down in the Westminster Bridge Road, in Lambeth, and Waterloo Road, and the reports have been highly satisfactory; in fact, the

Lambeth Vestry is so strongly impressed with the durability of the Jarrah blocks, that up to March, 1896, nine miles of the roads in that parish had been paved with this material. It is also used by other vestries of London, as well as by the authorities in the principal provincial towns. But Jarrahdale Jarrah is valuable other than as a road paving material. About fifteen years ago a large new dock was built in Port Adelaide, South Australia, and Jarrahdale was the only wood used in its construction. That dock is said to be still in splendid condition. This wood has also been employed on other docks and piers. We may add that the Hull Corporation has accepted a further tender of the Jarrahdale Jarrah Forests and Railways Limited, for 1200 loads of Jarrahdale, being all the Company could get forward in time to meet Hull's requirements, owing to the heavy demand for their timber.

MESSRS. SUTCLIFFE, STATHAM AND CO.

The Bury Art Gallery Committee have given the order for the ventilating and warming of their new Art Gallery and Public Library to Messrs. Sutcliffe, Statham and Co., Cathedral Corner, Fennel Street, Manchester. The system to be adopted is the "low pressure Plenum," with double ducts—one for warm air and one for cold air. Messrs. Woodhouse and Willoughby, of Manchester, are the architects, and tenders for the other work in connection with the building have not yet been invited. Messrs. Sutcliffe, Statham and Co. are a new firm who have recently established themselves, but they are well experienced in warming and ventilating; all the members of the firm and staff were directors, managers, or engineers. They are making a new ventilating fan under Mr. Sutcliffe's patent. It is not unlike the well-known Blackman type in general appearance, but, under close examination, it will be noticed that there is a distinct difference in the shape of the blade, which is so designed that while the efficiency near the periphery is fully maintained, that of the centre is rendered more effective, and the discharge from the fan is centripetal in place of centrifugal. It also has the merit of running absolutely quietly, and for this reason, if for no other, it should be in great demand for schools and other buildings where a humming fan cannot be tolerated.

A NEW PATENT GRANITE TILE.

One of our representatives writes: "Passing through the covered way from the station at Keswick to the Keswick Hotel a few days ago, I noticed that the tread was a specially easy and comfortable one. There seemed quite a firm grip of the foot, such as one fails to notice when one is walking upon the tiles that are so frequently employed for the purpose of paving in such places. Upon examination and inquiry, I ascertained that the material used is a new patent made by the Threlkeld Granite Company, at their quarry and works at Threlkeld. It is really neither more nor less than a granite tile. There is also cement in the tile, and the result is a combination which for strength and durability would be hard to beat. The specimens of the tiles laid at Keswick are evidence enough of the easy applicability of colour to the material, and the design is a pleasing and effective one. The colours are perfectly clear and distinct, and the substance is capable of employment in any colour and for any purpose for which tiling may be usually employed. There is ground

for no small satisfaction in the fact that there is now a new industry for the county of Cumberland. Under the skilful and enterprising management of Mr. Harkewitz, the managing director of the Company, there can be no doubt of the great future awaiting these tiles.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BANGOR.—For erecting the Hamilton-road Presbyterian Church, Bangor, co. Down, for the Committee of the Church. Mr. W. J. W. Roome, architect, Belfast:—
Robert Caiwell ... £8,195 | James Kidd ... £7,294
John Lowry and Son ... 7,975 | Jas. Colville, Bangor* ... 6,591
*Accepted for first blocks.

BELFAST.—For erecting the Shankill-road Mission Buildings, for the Committee of the Mission. Mr. W. J. W. Roome, architect, Belfast:—
John Lowry and Son ... £16,972 | W. J. Campbell & Son ... £13,454
Wm. G. Callen ... 15,000 | Courtney and Co. ... 13,249
McLaughlin and Harvey* ... 13,590 | [All of Belfast.]
*Accepted.

BELFAST.—For erecting a villa, Adelaide Park, Belfast, for Mr. Wm. Clarke. Mr. W. J. W. Roome, architect, Belfast:—
W. McConnell ... £1,245 | J. Killen ... £1,137
H. George ... 1,150 | R. Crawford (accepted) ... 940
[All of Belfast.]

CARLISLE.—For the erection of electric lighting station, &c., for the Corporation. Mr. H. C. Marks, C.E., 36, Fisher-street, Carlisle:—
Jno. Laing, Denton-street, Carlisle ... £7,668 8 1
[Includes all trades.]

CATERHAM.—For erecting a Soldiers' Home, Caterham:—
Quintenton ... £2,350 | Ward ... £1,939
Harmann ... 2,135 | Thompson ... 1,845
Cheeseman ... 2,100 | Vaughan, Caterham* ... 1,449
*Accepted.

COVENTRY.—For new drainage works and roads, Edgewick, Foleshill, Coventry, for Messrs. Peach Bros. Messrs. Harrison & Hattrell, surveyors, Coventry:—
J. Isaac & Sons ... £1,589 7 6 | McCarthy & Co. ... £1,244 10 0
T. G. Golby ... 1,420 0 0 | H. Mason & Son, Leicester* ... 1,242 18 5
Kelley and Sons ... 1,260 0 0
*Accepted.
[Surveyor's estimate, £1,400.]

CROYDON.—For pulling down and rebuilding Nos. 20, 21, 22, 23, Surrey-street, Croydon, for Mr. J. Mann Taylor. Mr. J. William Stevens, architect, 21, New Bridge-street, City, E.C. Quantities supplied:—

White and Co.	£4,850 0 0	S. Hart	£3,987 0 0
Lordan and Son	4,444 0 0	A. Bullock	3,974 0 0
Potter	4,377 2 11	Saunders	3,903 0 0
Whitehead & Co.	4,325 0 0	Bryan and Son	3,895 0 0
W. Smith & Son	3,990 0 0	E. P. Bullock & Co.	3,879 0 0
D. W. Barker	3,989 0 0	S. Page	3,700 0 0

DUDLEY.—For the erection of theatre (Birmingham-road, Dudley), for Mr. Clements. Mr. A. Ramsell, architect, Dudley:—

R. M. Hughes	£11,582	Bradney and Lloyd	£10,982
F. Lindsay Jones	11,565	Henry Gough	10,950
Thomas Skett	11,488	C. A. Horton	10,950
H. Willcock and Co.	11,440	H. Dorset and Co.	10,880
John Dallow	11,350	John Guest and Sons	10,854
Henry Cave	11,195	J. H. Whittaker & Co.	10,750
J. Harley and Son	11,000	Dudley (accepted)	10,750

FRINTON-ON-SEA.—For the erection of school buildings, for the School Board. Mr. S. T. James, architect, Frinton-on-Sea, Essex. Quantities by Messrs. Kemp-Welsh and Thomas, Bournemouth:—

J. McKay	£1,795	J. W. Dixon	£1,537
Balham and Co.	1,775	E. West	1,500
Myall and Ellis	1,760	Shillitoe and Son	1,490
H. W. Gladwell	1,574	T. B. Pitcher	1,450
T. Canham	1,558	H. J. Linnell, Frinton* ... 1,447	

*Accepted subject to Education Department's consent.

GRAVESEND.—For alterations and alterations on the Clarendon Royal Hotel, for Mr. R. L. Cosh. Mr. D. Carmichael, architect, London. No quantities:—

Multon and Wallis	£1,125	H. W. Martin*	£1,025
Tuffee	1,090		
S. Ransom and Co., London*			£271 10

*Accepted for bar fittings.
GREAT MISSENDEN.—For the erection of detached villa residence at Potters-row, Great Misenden, for Mrs. Wright. Mr. Guest Luckett, Aylesbury, architect:—
Senior and Clarke, Wendover (accepted).
[Lowest of five tenders received.]

HIGH WYCOMBE.—For the erection of buildings, &c., for the Electricity Company. Messrs. Moxam and Son, architects, High Wycombe, Bucks:—
H. T. Dickens ... £2,597 | H. Flint, High Wycombe* ... £2,383

TO OUR READERS.

We have pleasure in drawing attention to the inclusion, in the present issue, of a second lithographic plate in accordance with the announcement of the management to give two double inset sheets at frequent intervals. This increase, in scope and interest, of "The Builders' Journal," which has been prompted by the extraordinary increase in circulation, and the constant growth of the advertisement pages, must be as satisfactory to our readers as it is gratifying to ourselves. "The Builders' Journal" already makes a very wide appeal to the Architectural Profession and the Building Trades alike, its features embracing as they do a series of signed architectural and constructional criticisms, two illustrated special articles—one upon an artistic and another upon a constructional subject—Surveying and Sanitary Supplement, for sanitary engineers and surveyors, with illustrated technical articles, besides our news-notes under the heading "Bricks and Mortar," our information concerning current building under the title of "Professional Items," our "Enquiry Department," our complete list of Contracts and Competitions Open, &c. We are sure our readers will appreciate our latest enterprise in extending the usefulness of "The Builders' Journal."

An Architectural Causerie.

A SUM of £2,500,000 The Home Office Buildings. has been granted by Parliament for the erection of new Government offices, and the completion of South Kensington Museum. Would it be possible to put aside, out of this colossal sum, a few pounds, to finish the present Government offices in Whitehall, which have been standing so long incomplete? If you walk down the opposite side of the way, you see the crowning balustrade stop off short at the angle pavilions, and these features finished with what was once intended to be a temporary iron railing. As the building stands now, it is something like a statue without a head, but no one seems to mind. Complaint is often made of the tameness and lack of outline of this front, but no one seems to realise that the design is

incomplete, that if these angle features were taken up, they might give just the relief required. If you walk down Downing Street you find the beginnings of an arcade, or some such feature, projecting at right angles to the building. Is it intended that it shall remain like this for ever? It does seem only commonsense that, before spending such a tremendous sum on new buildings, those already begun should be finished. The present state of things is so utterly illogical. It is conceivable that the public takes no interest in fine buildings, that all it requires is a convenient structure, in which the

It is possible that many architects of the present day do not admire the appearance of this building—do not consider that it would be satisfactory even if completed. It certainly can hardly be called "picturesque," or "quaint," or "original," or by any of the other catch-words of the Art cant of the day; but the next generation may think different, and it is probable that few of those who belittle it could do as well themselves, and quite certain that none of them would like their own designs to be treated in the same way. Though this feeling may partly account for professional indifference, it can hardly be

CREDITON CHURCH. THE NAVE, LOOKING EAST. BY G. J. F. HOOKWAY.

business of the country can be carried on with comfort. Such an attitude is consistent enough—but then, why spend so much money on the façades of this building? It would have been possible to provide a much more convenient structure for half the cost, if convenience and economy were the only considerations. But if there are other things to be considered, and it really is desired to have a creditable building, why stop short in this way after spending so much, and cripple the design for the sake of an extra fourpence. It takes an Englishman to do these things.

supposed that the public has reasoned about it to this extent, and made up its mind that the building is not worth completion. The public, probably, has simply never noticed it. It is permitted to ask whether, if the head of the statue of Charles I. at Charing Cross had been omitted, the public would have been any the wiser? Whether, if the cross on St. Paul's was removed in the night, anybody would notice its loss? It is a question how far we are responsible for such indifference. We habitually put up such a crowd of characterless buildings, that even an architect is puzzled to know what they express.

It is small wonder, then, that the public attaches no meaning to them at all, and so takes no interest in them. If a complete building means nothing to it, doubtless an incomplete one means as much.

A. R. J.

London Riverside Churches.*

It may be supposed that Mr. A. E. Daniell has been encouraged by the success of his previous book on the City churches; for if the case had been otherwise he would hardly have appeared so soon with "London Riverside Churches." The author's own preface conveys a clear idea of his intention, which is to gratify those, on the one hand, to whom buildings are nothing but buildings; and those, on the other, who venerate particular churches because of great names associated with them. If Mr. Daniell had gone further afield, he would have found Cowley at Chertsey, but even now, beginning at Kingston, he has had enough to do, it may be supposed, to condense his material. A feature of the previous work, and one, to our thinking, invaluable, was the index which it contained. So immense is our monumental history that the list of proper names in that volume filled thirty-two pages. As we had then the opportunity of congratulating the author, we must now regret its omission. An index there is, it is true, but so scant are its contents that one turns to it only to be disappointed. Supposing, however, that some particular building is dear to the reader, and that therefore he makes the volume his own, he will find, in the pages which concern him especially, as compact a chapter of architectural and monumental history as could be desired. If it is not particularly readable (was there ever a handbook that was?), it is, nevertheless, a desirable work to possess. Its interest is for those more especially who inhabit the banks of the Thames, or whose proximity to it facilitates business. The London of to-day is nearly all extra-mural, and the Thames, from Blackfriars to Henley, is in reality little more than an alternative highway, devoted either to business or pleasure. The churches richest in monuments are those of Richmond, Twickenham, Chiswick, Chelsea, Westminster (St. Margaret's), and Southwark (St. Saviour's). Amongst the most notable names that occur for one reason or other are those of Edward Alleyn, Richard Baxter, Francis Beaumont, William Blake, Vincent Bounce, John Bunyan, Thomas Campbell, Lord Fred. Chas. Cavendish, William Caxton, Geoffrey Chaucer, John Dryden, John Evelyn, John Flaxman, Ugo Foscolo, Thomas Gainsborough, David Garrick, Grinling Gibbons, Oliver Goldsmith, John Gower, William Hogarth, Theodore Hook, Samuel Johnson, Edmund Kean, Sir Godfrey Kneller, Christopher Marlowe, Philip Messinger, John Milton, Thomas Otway, Samuel Pepys, Alexander Pope, Mrs. Rich (Cromwell's daughter), William Shakespeare, Sir John Suckling, James Thomson, Horace Walpole, Sir Christopher Wren, Edward Young, and Johan Zoffany. We conclude with an extract from the author's very excellent preface. That he is on the whole a dependable guide may be taken for granted. "The edifices which I have thus grouped together are rich in interest, and that of a very varied kind. They claim the attention alike of the student of Architecture and of the student of our history of literature. The former will view with delight the noble Early English work which he will find in St. Saviour's, Southwark, and will admiringly contemplate the

fine examples of the Perpendicular period presented to him in the churches of St. Margaret, Westminster, Stepney, and Kingston. In the church of St. Clement Danes he will do homage to the genius of Wren, and in its steeple he will observe the delicate art of Gibbs. Hard by are Gibbs's two greatest achievements—the churches of St. Mary-le-Strand and St. Martin-in-the-Fields. Lower down the river the peculiarities of the bolder, though less refined, Hawksmoor may be studied at St. George's-in-the-East, at Limehouse, and at Greenwich; while Archer's stately church of St. Paul, Deptford, cannot fail to be admired. Among edifices of recent construction, the rebuilt parish churches of Fulham and Chiswick—more especially the latter—must evoke warm commendation, and the new nave of St. Saviour's, Southwark, will be acknowledged to be worthy of the grand mediæval work with which it combines in forming so magnificent a whole. There is here no want of matter to engage the enquirer, whether his tastes be artistic or literary."

E. R.

THE WESTMINSTER IMPROVEMENT SCHEME.

BY ERNEST RADFORD.

IF the unification of Greater London is still a dream, it is yet one of the noblest ideas that we have, and as such is worth entertaining. The City itself, the centre of England's wealth, is almost inconceivably small, for along by the river, between the Tower on the east and the Ludgate, its extent is only two-thirds of a mile. Taking this as its base, and following the irregular line of the Wall, it will be found that the whole is included within the arc of a circle that at no point is more than a few hundred yards from the Thames. A truly magnificent and appealing idea is Sir Walter Besant's of extending the dominion of our constitutional rulers—the Lord Mayor and his aldermen—to the extremities of Greater London. The redeeming feature of our constitution is its easy adaptability to circumstances when resistance is proved to be useless; and what Sir Walter proposes would appear to be eminently practicable. To talk of ending what can be amended is agreed to be absurd in this country, and it is not a little surprising that such an inspiring suggestion has attracted so little attention. The foregoing remarks are introductory merely, and apply to the general subject—the extension of London's rule—but what now we have to consider is the propriety of the application that is to be made for a Parliament Act which will enable a private company to improve a portion of London according to its own ideas, as to how this may be done with the greatest advantage to the holders of shares. Our opinion expressed shortly is that there is clearly an opportunity here of improving the general appearance of Westminster from the point of view that is, or should be, obtained by coasting via Grosvenor Road and Millbank Street. The position will be at once understood by the reader who has as much of the map of London before him as the present occasion requires. He will have on his left the newly-erected Tate Gallery, and will wonder how long it may be before a respectable road connects it with Whitehall? The Embankment stops short, as we know, at Westminster, to be continued again beyond Chelsea Bridge, and to him who merely loafs by the river and dreams there would appear to be nothing easier than to connect the two works by embanking the piece between. He has omitted to notice perhaps that the Houses of Parliament, being right in the way, would in any case break the line at this point, and has probably no idea of the usual expense of undertakings like this, which involve the purchase of wharfage, and land at so many pounds, shillings, and pence, to the inch. It should be explained that whatever is done

will only be done by degrees, and that there is no present opportunity of realising the idler's dream of interminable boulevards. There is, as a matter of fact, some property here which is known to be purchasable, and the question that presses upon us is whether it shall be obtained by the people of London through their representatives, or by a dozen self-seekers through their's. The Bill giving powers to this Company will be opposed when introduced to the House by the representatives in Parliament of the County Council, and there is every reason to hope that they may be successful, for the principle involved affects the whole aspect of London—the London that is to be. If we allow this to pass, we shall have helped to establish a dangerous precedent in favour of piecemeal undertakings being sanctioned by law, and must face the possibility in this particular case of the land by the river being expropriated, in subsections to as many private adventurers as can scrape funds together. If the feeling of pain were limited to the parts of the body affected it would not find expression in speech as it does. With map and provisional plan before me, I have carefully studied the matter, and also gone over the ground, but am not prepared at the moment with any alternative scheme, nor do I suggest that a better could be engaged on the work than the architect whose services have been secured; but certain it is, that he would be happier if employed by ourselves on this same piece of land. "Cabined, cribbed, confined," as the guardian of so many interests must be, he must not be regarded as if he had a free hand in the matter, and was at liberty to commit his visions of London to paper, as Wren was after the Fire. Mr. Priolean Warren, who has an eloquent article on the subject in the Fortnightly Review of last month, would experience just the same difficulties if placed in the same position. He would be pitted, in spirit at least, against his employers, and if ever he gained a point it would be by fighting hard for Art's sake. It, fortunately, is not a question of merit as between architects, but one a great deal larger, involving, as I have said, the future of London. Mr. Warren has materially helped a good cause by what he said. It is proposed in the following number to consider the proposal in detail.

(To be continued.)

ACADEMY ARCHITECTURE.

With the May number of "The Architectural Review" will be issued a special Academy Supplement, in which will be given reproductions of the principal architectural works on exhibition at this year's Royal Academy. The number of these drawings which have been sent to us for reproduction either in "The Architectural Review" or in "The Builders' Journal" is quite unprecedented, and we are confident that the Architectural Room at Burlington House will this year receive greater recognition, in the way of illustration of exhibits, than ever before. The extraordinary unanimity architects throughout the kingdom have shown in selecting "The Architectural Review" or "The Builders' Journal" as the medium through which to reproduce their Academy drawings, is a clear indication that our publications are recognised by the Profession as the architectural journals of the day.

* "London Riverside Churches." By A. E. Daniell, author of "London City Churches." With illustrations by Alexander Ansted. Price 6s. A. Constable and Co.

CREDITON AND ITS DISTRICT.

I.—CREDITON CHURCH.

By G. J. F. HOOKWAY AND A. L. COX.

THE history of Crediton dates far beyond that of the Norman Conquest, for here, towards the close of the seventh century, was Winfrith, better known as St. Boniface the apostle of the Germans, born. Crediton then was a Saxon settlement having its dwellings and cottages and many smaller buildings together with the great hall for the Saxon leader.

The Parish Church, dedicated to St. Mary the Virgin and the Holy Cross, at once the soul and glory of the place, is a large cruciform structure consisting of choir of five bays, with aisles and clerestory and eastern Lady Chapel, nave of six bays with aisles, clerestory and transept and massive central tower rising to a total height of 92ft., a south porch over which is a parvise, and further eastward there is a large rectangular building which was formerly the Chapter House, but now used as vestries, etc. The Lady Chapel probably occupies the site of the Saxon Cathedral which afterwards became the see of Devonshire for 140 years. Of the character and design of this ancient building we know little, neither have we any written records referring to it, but it is certain that Boniface founded a church here.

The present church is of much interest and is mainly of the Perpendicular period, but on closer examination there can be seen remains of a much earlier building. On reference to the plan the Norman work is seen in the lower stages of the tower and the transept walls—of

the Early English period there is more remaining, viz., the Lady Chapel, and what was formerly the Chapter House. The decorated work is very little, consisting of two arches between the eastern wall of the choir and the Lady Chapel walls, and also the jambs of three windows. The nave and choir are wholly of Perpendicular work, together with the greater part of the masonry in the south transept. The top stage of the tower with the embattled pinnacles is also of this period.

It will be seen at a glance that the main character of the church is Perpendicular, the choir being the earliest portion of that style, and dates from 1409-16; the nave dating from 1416 onwards. In considering the various styles in which the church is built, the remaining Norman work demands our close attention. The central tower is carried on four massive piers, and, judging from their general character, date from about 1150; the capitals have rudely carved birds standing on the necking; the caps of the north-west pier have the chevron ornament peculiar to the style, whilst another cap on the same pier has two snakes rudely carved; the caps on the other piers are of the usual cushion form. The bases to the shafts are very good Late Norman work. The north-west pier contains a newel staircase leading to the upper stages of the tower, and the doorway is of this period. Of the Norman work in the transepts the most that remains is in the west walls, against which is built modern stair turrets (see plan) leading to where stood the old galleries. The buttresses at the eastern and western angles of the north transept are plain and flat, and project only 6in. from the face of the wall, they are massive in character and of good ashlar work. The middle or ringing chamber of the

tower is of Norman work, having in its east, south, and west walls two single light windows with semicircular heads: in the north wall there is only one window, the stair turret occupying the greater portion of the wall space where the other window would be. The whole of the Norman work shown on the plan is contemporary with the great transeptal towers at Exeter Cathedral, which were in progress with other parts of the building at the time.

During some excavations when the Lady Chapel was used as a grammar school, a double chamfered plinth, above which was a roll or scroll mould, was discovered, and marks what probably may have been the angle buttress terminating an eastern wall. The question arises: Did this buttress terminate the eastern end of the Norman choir? The presence of the roll or scroll moulding tells us that it is of later date than this period, and it will be seen, on reference to the plan, that there is considerable Early English work beyond the transepts, and we have every reason to believe that the east walls of choir and choir aisles are of this period. This being the case, we are inclined to think that this work is Transitional, and marks the angle of a retro-choir. Should this be so, the Norman choir may have terminated in a line with the ancient Chapter House.

We will now turn our attention to the Early English and Decorated portions of the building. The Lady Chapel, by far the most interesting portion of the whole fabric, is mainly built of the former style, but the shafts, with their caps and bases, and curtain arches of the two easternmost windows, and the east window, are of Decorated work. As shown on the plan, the east end, with the exception of the tracery of the window and the upper portion of the gable, is of the Early English period. On gaining the exterior we notice that the angles of the building are chamfered and stopped. These are, doubtless, Early English work, and the double plinth at the base of the east wall and returning round the buttresses, together with the irregular coursed rubble walling, is not unlike that used by the late Norman builders.

The two remaining windows have Early English jambs, and it is surprising to find that despite the fact that these windows, having been filled in in Perpendicular times with tracery of that period, and the building having gone through so many changes, that these old jambs remain to the present day. On the north and south walls just above the decorated responds which carry the arches opening into the choir aisles are two Early English shafts. What their original purpose was it is at present difficult to assert, for they do not project beyond the face of the wall as in the ordinary manner, but are in a chase so that the face of the shaft is flush with the wall. It is doubtful if they were vaulting shafts as only these two remain, no traces of others can be found.

Crediton Ch.
Lady Chapel from S.E.

The arches by which the Lady Chapel is entered from north or south aisles are Early Decorated and well-proportioned. Below the cap of the north-east respond are traces of colour bearing an inscription, but nearly obliterated. With regard to the east wall of the choir it is doubtful to say definitely, but it appears to be Early English. Near the present roof of the Lady Chapel are traces of a former and lower roof besides the cill of an early east window. On the north side of this wall are the blocked up remains of a small door which probably opened into a chamber used as a reliquary. Below this door are the remains of a corbel which probably partly carried a stone step leading on to the reliquary floor. About this time we learn that Crediton Church was rich in relics, and it is possible that a structure of this kind existed, for the door is placed on a level with the high altar. The existing portions of the Early English work date from 1194-1206. At this time the Lady Chapel was in course of erection at Exeter Cathedral, under the supervision of Bishop Marshall, who had a house at

gonal granite shaft of an old Perpendicular cross, such as are common to this part of Devonshire. In another room of the same building, called the governor's room, there are many pieces of the old parish armour and massive oak chests. The armour is very interesting, and would not look amiss if arranged on some wall or walls of the church. The second stage of the tower is of Early English masonry, and starts from a deeply chamfered sill; there are two windows on each face of this stage, resembling those of the east and west wall of the desecrated Chapel of St. Lawrence at the end of the town. The jambs are chamfered, and the heads have equilateral arches, with the labels running as a string course around the tower; on either side of these windows are trefoil-headed niches of the same date, with chamfered jambs. Large beams cross each angle of the tower, and from their appearance and position were intended to carry a wooden spire. The tower is covered with a flat roof, and finished with a perpendicular parapet and large octagonal pinnacles at each angle. The bells are eight in number,

than the nave. The aisle windows are set back with a deep hollow moulding which starts from small circular shafts, the bases of which rest on a stone seat which partly fills the recess under each window. The whole of the tracery in the church is of Beer stone, with the exception of the jambs, which are of Thorverton trap, resembling in character the material of which the church is built.

The roof is lead covered and entirely modern. The old lath and plaster one of churchwarden date was taken down and the present oak roof takes its place. The original roof, which was very flat and greatly enriched with carved bosses, fell into decay, very probably through the procrastination of much needed repairs, that came too late to be effectual, and to the lack of funds. This roof was in existence when the parishioners bought the church, some fragments of the rafters and carving were to be lately seen in one of the vestries. Much of this roof was wantonly used in providing fuel for the preparation of the annual dinner of the twelve governors. This was done until forty years since, when the governors

Crediton, and in all probability influenced the works.

On again referring to the plan, the large rectangular structure east of the south transept is seen to be of Early English date. This building is contemporary with the Lady Chapel. On the north side of the entrance door in the west wall may be seen built in a double piscina, and on reference to the sketch it will be readily seen that it is incomplete—either it is not in its original position or else it has been partly cut away to allow for the present door to be made. From the south choir aisle may be seen two decorated arches, now blocked up, and which originally opened in where is now the priest's vestry, and in the room immediately over this the moulding and half the soffite of an arch may be seen. This structure may have been a chapel, but in all probability it was the Chapter House, for such a building existed when the half-ruinous church was bought by the parishioners.

In the room above the priest's vestry there is a large fireplace spanned by a lintel which, on closer examination, proves to be the octa-

and were cast in 1774, except the tenor, which dates from 1814. The clock chimes every three hours.

At the dawn of the fifteenth century the building was in such a ruinous condition that it could scarcely be used as the parish church. In 1409 Bishop Stafford ordered the rebuilding to be commenced. The choir was the first portion of the church to which the builders turned their attention, and was designed with a light and lofty clerestory, each window of four lights, and similar in pattern to those in the aisles. On reference to the exterior view, a fair idea may be formed of the character of the work. Nearly all the tracery has been "restored," and the present windows are of Late Perpendicular design. This, somehow, does not seem right, as most of the ancient work was Early Perpendicular. There is a marked difference in the windows of the clerestory of the choir and those in the nave, the former being narrower than the latter; and it also makes a pleasing difference in the wall space, while, at the same time, it proves that the choir was of a different date

used the room over the vestries called the governors' room, where the annual feast took place. There are only a few bosses of this roof remaining, these are kept in the library over the porch.

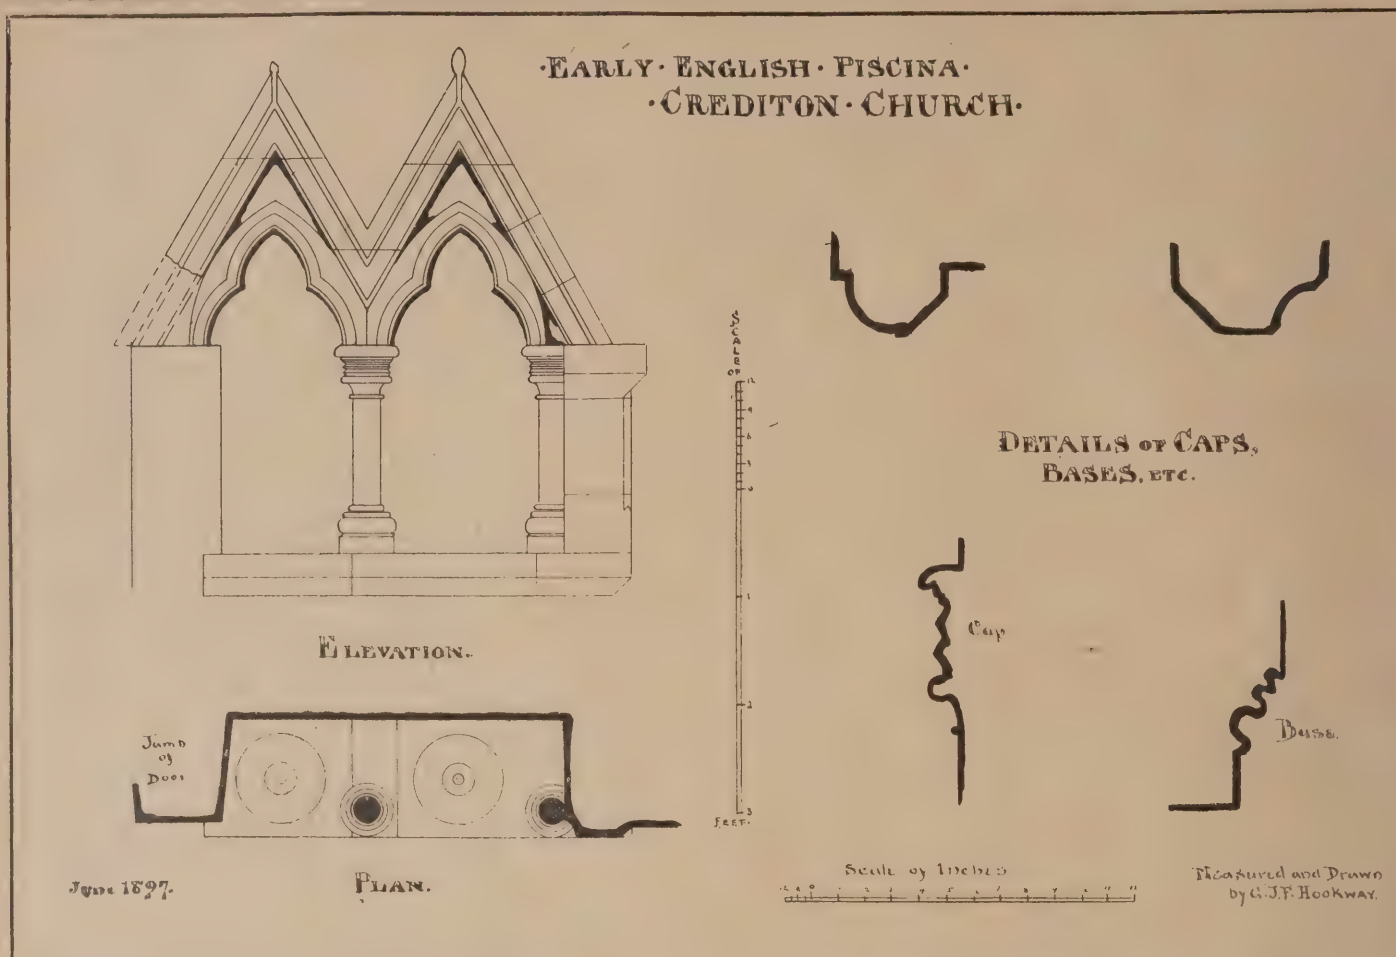

The east and west windows are very large, each of eight lights, the tracery being Early Perpendicular. The west window is almost an exact copy of the east, with very little alteration.

On returning to the choir, which was finished in 1415, the remains of the sedilia call for our special attention; it is situated as usual in the easternmost bay of the south aisle. There are three divisions of equal height, each with rounded panelled backs. Nearly all the carving is gone, and the whole much mutilated and disfigured. There is much colour remaining, mostly red, with slight touches of green and gold in places. At the back is a kind of altar tomb recess, this being enriched with panel work similar to the other side. The base of this tomb is richly arcaded and crocketed, the back over the slab or table being similarly treated. Above rise

DETAILS OF
NORMAN CAPS AND BASES
• CREDITON CHURCH •

canopies with traceried and crocketed beads. The surmounting cornice is richly treated with carved figures. The cornice resembles in character that on the tombs of Bishops Bronescombe and Stafford in Exeter Cathedral. The canopies were the work of the last-named bishop, circa 1395 to 1419. The date of the sedilia is about this time also.

Stafford pressed and encouraged the rebuilding of the church and choir, and the whole was completed during the prelate's episcopate. The south porch in the third bay of the nave aisle is of two bays and vaulted, the ribs and bosses being good examples of Perpendicular work. The vaulting is of Beer stone, the shafts brought down on to the stone seats on either side the porch. Above is a parvise used as the library, being reached by a staircase which opens into the nave.

We will now turn our attention to the monuments which the church contains. We know from documentary evidence that some of the early bishops were interred here, but no portion or any traces whatever of their tombs have yet been found to mark the spot where either of the nine bishops were buried, either in the fabric itself or the adjacent churchyard. Of the monuments that remain and demand our notice, the most interesting is that of Sir John Stully (a sketch of which is reproduced). The tomb bears traces of colour and is much defaced, the lower part is of different date, probably part of another tomb long ago destroyed; the panelling on the sides and end is of late Perpendicular work.

In the easternmost bay of the choir and on the north side are two elaborate and lofty monuments in the Renaissance style. The first is to the memory of Sir William Perrain, an eminent Puritan. This is an interesting monument, and contains much decoration, with good arabesque panelling and quaintly carved serpents. He is represented in his scarlet judge's robe, with the coif on his head, and a chain of SS round his neck. The second monument is that of one of the Tuckfields, of Shoebrook, to whom the property went on the death of Sir William Perrain, whose tomb we have already described.

In the churchyard opposite the south porch

there is a fine Perpendicular base of what in all probability was the churchyard cross, it is of Ham Hill stone, and, though much defaced and unfortunately turned upside down, it bears traces of sculpture. On looking about to discover the shaft belonging to the cross we find there is one in the room over the priest's vestry, and used as a lintel, which spans the fireplace; it only remains to mention that this shaft measures 7ft. in length, is 14in. wide, and tapers to a width of 9in., and it is doubtful whether this shaft belonged to the base above described. The shaft is of granite, and has been cracked or broken about little more than half-way. We trust at some future date this cross and the one in the "Town Green" at the west end of the town will be restored. There is nothing of interest in the churchyard, but a few years ago some interesting old buildings on the north side were pulled down to enlarge it.

(To be continued.)

A CHILDREN'S HOLIDAY HOME for 100 children is to be erected at Clacton-on-Sea. Mr. Charles Bell, 3, Salter's Hall Court, is the architect.

THE Governors of Richmond School (Yorkshire) are considering plans for the enlargement and improvement of the present school-house, which stands in the picturesque grounds of the Friary.

A LOCAL GOVERNMENT BOARD inquiry has been held into the application of the Town Commissioners of Newry for a loan of £6000, for the purpose of building working-class lodging-houses.

MR. F. FOX and Mr. W. G. R. BOUSFIELD, 99, Gresham Street, E.C., are the architects for the extensive alterations that are about to be carried out at premises in Commercial Street belonging to the Birmingham Vinegar Brewery Company.

THE ancient almshouses of the Worshipful Company of Coopers, in School House Lane, Ratcliff, which were erected in 1539, are being demolished in order to make room for the extension of the Free Trade Wharf and other business premises adjoining.

AMONGST NATURE AND ARCHITECTURE.

BY JOHN SNOWDEN.

IN a paper on "An Artist's Notes Amongst Nature and Architecture," read at Bradford, Mr. John Snowden gave Art priority over literature, because, he said, Art existed ages before letters, as was shown by researches into the origin of the Egyptian hieroglyphics, thoughts being at first expressed by the figures or fact with which they actually corresponded. It was only when, in course of time, the inconvenience of so slow a process in the delineation of ideas became obvious, that the first marks or lines of object-drawing were made to stand for the whole subject. The sign, however, being constantly written, became less and less like that small part of the picture which it was intended to suggest, and the original design ultimately dropped out of view. He remarked that almost every object around us was subject to

THE INFLUENCE OF ART FOR GOOD OR EVIL

and it behoved those who possessed understanding to impart to others the faculty of discerning the good from the bad, and of being able to appreciate to its full extent the good, the true, and the beautiful. The manufacture of textile fabrics, the decorations appertaining to everyday life, and the common objects of utility, down to the merest piece of crockery, tended to show what a wide influence Art must have. There was a close affinity between Art and Architecture. Whilst the architect perhaps felt a keener delight in structures of a bygone age, the artist would be in close sympathy with him, and would not miss an opportunity of adding to his portfolio anything that came before him of pictorial archaeological value. The pleasures of country excursions were greater still to the artist, for in Nature's ever-varying mood, with the fleeting effects of shadow, the captivating play of colour, and the pathos of historical

association, the artist found abundant scope. It was said that

GIORGIONE AND TITIAN

founded their colouring on the autumn tints, whilst Rubens looked for his brilliant hues in the light and freshness of early spring, and Constable felt oppressed when visiting the hills and solitude of Westmoreland. He looked in vain for churches, farmhouses, or scattered hamlets, and considered flat agricultural Suffolk to be a more delightful country for the artist. This feeling explained the remark that a landscape painter often found the dullest spots the most suggestive. A group of cattle standing in shade on a dark hill, with a glimpse of sun falling on clouds in the distance; a heathery roadside; an ivy-grown cottage at the end of a lane running between hedges of brier-roses and honeysuckle; these furnished abundant material for the pencil. Common objects abounded in the picturesque. An artist fond of Architecture found a veritable mine of wealth in the relics of bygone ages, so that, imperatively, he was an antiquarian, if not so deeply versed in all that related to its special history. The whole of our picturesque island was studded with noble

CATHEDRALS, PARISH CHURCHES, CASTLES, and manor houses, which bore silent witness to the culture of a vanished age, and to a race of craftsmen who had left no successors. Even architects, in their professional practice, often found cause to destroy the poetic charm of these venerable piles. For an instance one need not go further than Kirkstall Abbey, which had been despoiled of its rare beauty, and every vestige of artistic and poetic beauty done away with. Mr. Snowden then dealt exhaustively with the picturesque character and surroundings of well-known artistic resorts.

THE NEW COUNTY BUILDINGS AT WAKEFIELD.

VISIT OF THE YORK SOCIETY.

THROUGH the courtesy of the architects (Messrs. Gibson and Russell, London), the members of the York Architectural Society were recently enabled to pay a visit of inspection to the magnificent county buildings which have been erected for the accommodation of the West Riding County Council at Wakefield. The site which the buildings occupy has been well chosen, being situated on high ground, in close proximity to the Town Hall and the West Riding Court. In shape it forms a diamond, which embraces an area of 45,136 square feet, and is bounded on all sides by streets—namely, Bond Street, Cliff Parade, Burton Street, and Hardy Street. The elevation to the first named is very ornate, one of the principal features of the façade being a loggia consisting of six bays on the first floor, on the pilastres between which are sculptured in niches life studies illustrating the leading manufactures of the county. These figures represent a miner, an iron moulder, a mechanic, a spinner, a glass blower, a potter, and an agricultural labourer. They are the work of Mr. Rhind, of Edinburgh, and serve as a fitting memorial to the enterprise and progress which characterises the large and populous district over which the West Riding County Council is called upon to provide. It will be noted that Mr. Rhind has chosen his models in an appropriate, every-day, working costume, the spinner lass, for instance, with shawl on her head, the farm labourer attired in smock frock, and the miner stripped to the waist, and these will doubtless be objects of interest to future generations as a faithful

record of the period. At the main entrance, sculptured in bas relief, are figures representing "Education," "Health," "Progress," and "Justice," while above rises to a height of 130ft. an

OCTAGONAL TOWER AND DOME,

surmounted with a cupola. This is balanced at the north-east angle by an octagonal turret. The elevation facing Cliff Parade harmonises with that in Bond Street, but differs therefrom by the addition of five fine Oriel windows on the first floor, these being enriched with carving showing the arms of the various towns in the county. Passing through the wrought-iron gates at the main entrance, the party was conducted by Mr. Marsh through the vestibule and hall to the staircase leading to the various committee-rooms on the first floor, after inspecting which the Council Chamber was entered. This spacious apartment is probably one of the finest in the province. In plan it forms a square, covering an area of about 2500 super feet. The roof is supported on four steel girders, encased in wood. These are arranged in the form of a Greek cross, from the central square of which a domed roof is raised on segmental arches, terminating in a cupola giving light from above. Ample light also is afforded by the two magnificent windows on either side of the hall, and six smaller ones. Artificial light is supplied to eight massive hanging electroliers, which are richly decorated in design.

It is proposed to erect a large Methodist hall in the most conspicuous part of Bermondsey. The entire project will involve an estimated expenditure of fully £30,000. The land alone on which the pile of buildings is to stand has cost over £10,000.

ARTISTIC COPYRIGHT.

WITH SPECIAL REFERENCE TO ARCHITECTS.

BY MONS. GEORGES HARMAND.

IN a paper on the above subject, read before the Royal Institute of British Architects on Monday night, Mons. Georges Harmand, avocat à la Cour d'Appel, Paris, pointed out that for the last fifty years the use of copyright has extended through all departments of Art and literature, and urged that development of the means of artistic or industrial reproduction has given an ever-increasing importance to copyright. One of his objects was to give an idea of the state of opinion on the Continent regarding the question of copyright. Over the greater part of Europe architects enjoyed protection for the works they created, and it was of greatest importance that the Profession in England should have the same privileges. Unity in the protection of their Art was the best means to its development and its triumph. The fact that for a long period architects had not claimed copyright in their works was no reason against the right. There was ample evidence to show that from remote ages architects had been accustomed to put their names, or to leave some other

TRACE OF THEIR PERSONALITY

on the monuments they erected. Instances of the custom were cited by the lecturer from a paper read by M. Ch. Lucas at Milan in 1892. Years before any other European country, England had made laws for the protection of artists and authors. Till quite recently, however, the reproduction of architects' designs for publication was an expensive matter, and only monographs of a few very important buildings, or the works of a few very great architects, had been published. In the present day it was easy for architects to get full reproduction of their works, and for the sake of their own memory, their credit, and their fame, they should strive to secure the preservation of their drawings, and the guarantee of their authorship. In England the rights of artists in reproducing their works by printing processes were protected by statute, architectural drawings being expressly mentioned; but

ENGLISH ARCHITECTS APPARENTLY LACKED CONFIDENCE

in their rights, and hesitated to claim the protection the law afforded them. The question of unification of the legislative measures relating to copyright had been well thrashed out at congresses held by the International Literary and Artistic Association at various cities of Europe; and, as a result, a convention was agreed upon at Berne, in 1886, between Great Britain, France, Italy, Spain, Belgium, Germany, &c., which provided for the grant of copyright to, among other works, drawings and works of painting and sculpture, to engravings, prints, &c., and to "plastic works relating to geography, topography, Architecture, and sciences in general," also to any production belonging to literature, science, and Art capable of reproduction by printing, &c. But the law of some nations party to the convention did not fully protect Architecture. In Germany an architect enjoyed copyright in his designs so long only as they exist on paper; he lost his rights in his drawings as soon as a building was erected from them. In Great Britain, the lecturer understood,

ARCHITECTURE WAS NOT PROTECTED BY LAW, except for drawings and plans. Conferences had been held all over Europe by the Association above referred to, and strenuous efforts made to secure full protection for Architecture. Having dealt with the object of copyright, its privileges, the class of work whose authors were universally admitted to be entitled to the right, the lecturer went on to show that, by their methods of work and the nature of their inventions, architects were in a similar position to painters, sculptors, and other artists, and should be conceded the same safeguards for their protection. Quoting judg-

ments of French and Belgian legal tribunals, emphasis was laid on a recent decision at Antwerp, where it was held that, in order to be considered the author of a protected work, it was not necessary for a man to produce a work entirely original in all its parts; it was sufficient that he had made a design, traced a drawing and plan, and infused his own individuality into elements gathered from works whose copyright had expired. Such was an artistic creation which merited the protection of the law. The lecturer then touched upon the arguments adduced against the rights contended for, and having shown their unsoundness, proceeded to treat of the relations between the architect and his employer. The architect furnishes plans and drawings, and agrees with his client for their reproduction in a building on a certain site. Such plans and drawings represent

THE ORIGINAL WORK OF THE ARCHITECT.

The client bargains for the possession and use of the building, and the enjoyment of its beauty, if it has artistic qualities. But, the lecturer contended, the right of reproducing the building on paper, by drawing, photography, or printing process, did not pass to the client, but remained in the architect. If the client desired in any way to reproduce his building pictorially by engraving or other process, the architect could consent, for an agreed consideration, or he could refuse. The client, again, had no right to the original drawings, but only to copies, and this was sufficient to warn the client that the architect intended to keep the copyright for himself. The drawings handed to the owner should show some evidence of their being copies merely, and should bear the architect's signature. The owner had no right to repeat the building on any other site, or to permit anyone else to do so. The architect received fees calculated on the cost of the one building only. Repetition could only be made with the architect's sanction; and if repeated, he was entitled to fresh fees. It was important for the preservation of his rights that the

ORIGINAL DRAWINGS SHOULD BEAR THE ARCHITECT'S SIGNATURE.

His signature could not well be preserved on the buildings themselves, but as they were mere reproductions of his drawings, his interests would be sufficiently safeguarded by the signature being placed on the original drawings, and any copies, prints, or photographs of them. An architect could always print reproductions of his drawings under his own name; but the client had no more right to make prints or photographs of his buildings without the architect's consent than to repeat the buildings on another site. In concluding, the lecturer expressed his conviction that when architects felt that they could work and create for their profit, and have the reward of their pains and efforts, they would strive more after genuineness, and Architecture as an Art would progress, to the greater glory of beauty. If architects in Great Britain did not enjoy such rights in their creations as the lecturer had advocated, he hoped they would do their utmost to prevent the matter being overlooked in any new Copyright Act.—Professor Kerr, proposing a vote of thanks to the lecturer, said if in this country they could establish anything in the nature of architectural copyright—he did not think they could—it would be of very great service, in the way of

ESTABLISHING A CLAIM

upon the public attention which was not accorded to architects now. There was a great difference in respect to the Architecture of one country and another, just as with artists, and there was all the difference in the world between the appreciation of Architecture in the country to which the lecturer belonged and its appreciation in this country. The Latin race seemed to be charmingly possessed with the faculty of Art in a way which we of the dormant nations could not pertain to. Therefore, when the lecturer spoke of the glory of the architects, they in England were bound to tell him that their glory was not

recognised in the English courts of law. Even if the architect's copyright could be established, it would fare very badly at the hands of the gentlemen who were disposed to put forth their efforts in the examination of an architect—as to what he claimed to be Architecture. He thought that the view of a judge with a clear head, who paid strict attention to common sense, as to architectural copyright, would be this: that the law of England especially was founded upon common sense principles for the multitude, and that it recognised copyright, patent rights, and protection of any sort

AS COMMERCIAL VALUE

and nothing else. "Show me," he would say, "what damage you have sustained in pounds, shillings, and pence, and then I will tell you what I think of it." If they only suffered damage in respect to self-appreciation of their work, he was afraid it would not be understood. The lecturer insisted upon the architect's artistic merit being in the drawing and not in the building, and said that the architect designed on paper, and that the building was a reproduction of it. That was a new idea, and he did not think it was the correct one, or that it would be recognised in our courts of law. They had had it in a somewhat different form in the question of the ownership of drawings, when the judges were decidedly of opinion, from their point of view—which did not accord with the architect's view—that that which the architect supplied to his client in consideration of payment was his best services in designing, and the paper drawing, under the circumstances, could only belong to their employer. Personally he thought they would

NEVER SHAKE THAT OPINION.

They could try, and one way was by bearing in mind the distinction drawn by the lecturer between the work of Art as represented by the drawing and the reproduction represented in the building. The contention here was that the building was the work of Art, and that the drawing was merely the representation of it. They had all the copyright they could expect and would have as regarded the payment, provided they registered the paper work, and paid the fee. There was a great deal of force in the lecturer's argument that copyright was a privilege of the author, and that the architect was the author of an artistic design, and therefore entitled to copyright it. There was one respect in which copyright was desirable, and that was when an architect was employed to design a house in the suburbs, and then found two or three house agents sent emissaries at a fee of five shillings to draw the design. He was afraid young architects were very much aggrieved in that respect.—Mr. John Slater seconded, observing that it did seem a little absurd that a painter who painted anything of a portrait or view could claim copyright, while the architect who was obliged to put his design upon paper, because he had no other way of carrying it out, could not have a copyright for his own building. Was not the design of a building just as saleable as a picture? And was it not

JUST AS MUCH THE ARCHITECT'S WORK

as that of the artist? He was quite sure that architects, not only in this country, but all over the world, would be only too happy if the efforts the lecturer was making to obtain copyright for them were successful.—Mr. J. Hebb remarked that, looking at the decision of the judges with regard to the property in architects' drawings, it would be quite useless to attempt to set up a claim for copyright in design.—Mr. E. W. Hudson said architects borrowed their ideas more or less from those who had gone before, and therefore it was only fair if they were inspired with anything worth looking at that they should give it "as freely as they had received."—Professor Aitchison said, for small buildings particularly, architects felt there was a need for some scheme of payment. At present it was quite disproportionate to the time and skill expended upon them.—M. Harmand briefly replied.

POLICE STATIONS AND PRISONS.

By GEORGE H. BIBBY, F.R.I.B.A.

V.—CONSTABLES' RESIDENCES.

(Continued from page vi.)

THE residences for the superintendent of the police, sergeant and single constables should not only be separated one from the others, but also from the charge room and offices of the police station and business

might be used as a bathroom. The bedrooms for the sergeant's residence are shown at F G and H. Quite apart from all these are the single constables' kitchen at J, and their living room at K. At L M N are the cubicals for the single constables' beds, the bath is at P, while a drying stove and lockers are located at O. The plan generally is based upon principles which have been approved by constabulary authorities, and may be adapted to the requirements of various localities.

Another form of police station is shown by the plans given in Figs. 13 and 14, where the accommodation includes a provision for an inspector's residence, business rooms, and cells

for nine male and four female prisoners. On Fig. 14 B is the charge room, A G H and E offices, and D is the waiting room, J stores, and K the police parade shed. The residence for the inspector is entirely upstairs; on the first floor level (see Fig. 13), and consists of A and B, bedrooms; C, sitting room; D, kitchen; E, scullery; and F, pantry.

Detached accommodation for the single constables, stables, and other adjuncts, would be erected within the parade yard or enclosure attached to this station.

The official regulations or suggestions, in reference to sanitary arrangements in police stations, do not greatly vary from those required in connection with other public buildings. The subsoil of the establishment should be effectually drained by means of suitable earthenware field pipes, whenever the condition of the site renders such a precaution necessary; such pipes should be laid in such a manner as not to communicate directly with any sewer, cesspool, or soil drain. The drains for the building, other than those above mentioned, should be of good, sound stoneware, or other suitable material; they should be of adequate size, and, if constructed for conveying sewage, should have an internal diameter of not less than 4in., and be laid on a perfectly solid foundation with an even fall, which should be, wherever practicable, not less than 1 in 60 near the buildings, and with sufficient socketted or other suitable joints, made watertight; the joints should never be made with clay, and if Portland cement is used, they should, after being laid, be cleared inside from any projecting portions of cement, so as to prevent any obstruction to the flow. The soil

FIG. 12.

portions of the premises. In connection with the larger station houses, it may be found convenient to add offices and apartments for purposes other than the custody of prisoners, and to give some accommodation for the storage of lost or stolen property, the housing of fire-escapes, ambulance carriages, and other appliances for public use, together with disinfecting chambers, &c.

In Fig. 11 is given the ground-plan of a police station for the accommodation of eight prisoners, in the cells marked C, the charge room being at B, and the superintendent's office at A; D shows the position of the constables' cleaning room. No apartments are placed above the cells, but accommodation for three (single) policemen is provided above the charge office and the superintendent's business room, and these rooms are approached by a staircase adjoining the latter; the advantage of this arrangement is that the single constables are quite isolated from the residences appropriated to the superior officers. The sergeant has, on the ground floor, a scullery, kitchen, and sitting-room, with a separate lobby entrance from the street; while the superintendent has a sitting-room at J, a parlour at K, a kitchen at L, a scullery at M, a pantry at N, and a store at O. The two residences are kept quite distinct from each other and from the police station, and all three divisions are provided with separate yards.

The upper or first floor plan on Fig. 12 shows, at A B C and D, four bedrooms for the superintendent's family, and a small store-room at E; one of these (preferably that at E)

FIG. 11.

drains should not pass under the buildings if it can be avoided, but if it cannot, one line of drain only should be laid in a straight line for the whole distance beneath the building. This should be of cast iron piping of good thickness, jointed with molten lead, or of sound socketed stoneware pipes, jointed with Portland cement and completely embedded in and covered with good and solid concrete at least six inches thick all round; and there should be no branches led into the drain under the building.

FIG. 13.

Every inlet, other than such as are provided solely for the ventilation of the drains, should be effectually trapped.

Drains which communicate directly with a sewer or cesspool should be provided with a suitable intercepting trap at a point as near as practicable to the sewer or cesspool. This trap should be placed in an inspecting chamber constructed of brickwork in cement, and provided with a fresh-air inlet and air-tight cover. The bore of the intercepting trap should never be larger than that of the drain delivering into it.

The drains from the building should be laid in straight lines, and the junction of two drains should be made at as sharp an angle as practicable, in order to avoid any interruption to the flow of sewage at that point. When a change of direction occurs in a drain, or when two or more drains meet, a manhole or inspection-shaft should be provided to give access, by which the drains can be cleared of obstruction, if necessary. The bottom of the manhole should be channelled, so as to secure the flow of the drainage past the junction by an easy curve, and an extra fall should, where it is possible, be given to the curved portion of the drain in the manhole.

The drain ventilation should be effected by admitting fresh air to the access-chamber at the upper side of the intercepting trap, so that a current of air should pass through the drain, from the highest part of which a proper air-shaft should be carried vertically, to afford an outlet for the air passing through the drain. This pipe should be so placed, and carried to such a height, that the foul air may not be liable to be discharged into any building, or where it can be injurious to health, and should in no case be less than 10ft. in height.

Every opening provided in accordance with the arrangement above described should be furnished with a grating or other suitable cover, for the purpose of preventing any obstruction or injury to the drain by the introduction of any substance through such opening. The air must have free passage through these gratings or covers by means of apertures, the aggregate extent of which should not be less than the sectional area of the pipe or drain to which the gratings or covers are fitted.

All pipes or shafts which may be used in connection with the ventilation arrangement above specified should be of a sectional area not less than that of the drain with which

such pipe or shaft may communicate, and not less in any case than the sectional area of a pipe of 4in. in diameter; no bend or angle, except where unavoidable, should be formed in any pipe or shaft used in connection with these arrangements.

The soil-pipe from every water-closet should be at least 4in. in diameter, and should be quite air-tight; it should be fixed outside the building, and continued upward without diminution of its diameter, and (except where unavoidable) without any bend or angle, to such a height above the building as to afford, by means of the open end of such pipe, an outlet for foul air; it should be in such a position as to be free from any danger of contaminating the air of any building. The waste-pipe from any slop sink, if independent of any soil-pipe, should be similarly constructed.

All waste-pipes from bath, pantry, or scullery sinks, the overflow-pipe from any cistern and from every safe under any bath or water-closet, and every pipe for carrying off waste water, should be trapped and taken through an external wall of the building, and discharged in the open air over a channel leading to a gully trap at least 18in. distant.

Every water-closet or earth-closet should be in such a position that one of its sides at least shall be an external wall. It should have a window of not less dimensions than 2ft. by 1ft., exclusive of the frame, and opening directly into the external air; in addition, such closets should be provided with adequate means of constant ventilation by at least one air-brick, built into an external wall, or by an air-shaft, or other effectual method.

The water supply to the buildings should be good and sufficient, with all necessary supply pipes, services, cisterns, fittings, and apparatus for the purposes of the water-closets, separate and independent from that used for drinking, culinary, and household purposes; the overflow pipes of every cistern should have no direct communication with soil-pipes or drains.

The following forms of apparatus are not to be used in connection with police station buildings: bell, dip, and D traps. Rainwater pipes should deliver into an open channel, and

The selection of a suitable apparatus is a matter of some difficulty. There are about twenty-five firms well known in this country for their manufacture of sanitary ware and apparatus of various descriptions, and from these may be selected fittings to meet the varying preferences of committees and others concerned with the erection of police stations.

With regard to the heating of police stations, there are many engineers who have devoted special attention to this particular subject. To place such works in the hands of persons quite without previous experience as to the difficulties to be met with in police station construction (and which are largely connected with considerations respecting the safety of the prisoners and the circumstances under which police stations are conducted) would be to court failure, but on the other hand there are some systems of heating and ventilating police stations which, in quite opposite modes, satisfactorily answer all purposes. Such systems are frequently the result of laborious scientific research, and extensive and long-continued experiments carried out by firms having at hand appliances and data beyond what could be reasonably expected to be in the possession of architects, medical men, and others interested.

(To be continued.)

THE dust destructor erected by the Poplar District Board of Works on land in Glaucus Street, Bromley, at a cost of £11,000, has been opened. The destructor, which contains fourteen cells, is calculated to destroy about 130 tons of refuse per diem, and the shaft is 150ft. from the surface of the ground.

THE annual dinner of the Sanitary Institute was held at the Holborn Restaurant, recently, Sir Douglas Galton presiding. For twenty-one years the Institute has been doing good and useful work in the dissemination of sanitary knowledge. It maintains a library and a permanent museum of sanitary appliances, and there are frequent lectures for students and those men and women interested in the science. The museum was founded in memory of Dr. E. A. Parkes, of Netley, and

FIG. 14.

to a gully of not less than 18in. from the foot of the pipes, if this distance can be secured; if not, the bottom of the rainwater pipe should be furnished with a trap having a fresh-air inlet.

The foregoing regulations, it will be seen, correspond in various respects with those officially required in connection with workhouse, asylum, hospital, and other public buildings. It would, however, be an advantage that water closets and slop sinks, &c., should, in the case of all police stations, be placed in an annexe built away from the main buildings, but connected therewith by narrow-neck passages in the manner generally to be found in modern hospitals, the idea being to obtain cross ventilation between the closets and the main buildings.

the first president was the Duke of Albany. The Duke of Cambridge, who has been a member of the Institute for over fifteen years, is now the president.

A TUNNEL is being pierced at Berlin under the Spree, between Stralau and Treptow Park. As regards magnitude there is nothing extraordinary in the work; but the difficult conditions, owing to the ground being sand, permeable to water, entitle it to rank as an achievement. The principle is that adopted in the Central London Railway, namely, a succession of steel rings within a cuirass of cement, and, of course, the use of the shield with compressed air is a necessity. The method is, indeed, a precise copy of the English one. Progress is made at the rate of from sixty to ninety centimetres a day.

Surveying and Sanitary Notes.

In the Queen's Bench Division recently the case of Heaysman v. the Bromley Urban District Council was heard. It was an action brought by Mr. William Heaysman for damages for an alleged trespass committed by the defendants in constructing a sewer across the plaintiff's land. The plaintiff was the owner of sixteen houses in Wharton Road and North Road, in the district of Bromley. A sewer ran through the gardens at the backs of the houses with which the drains of the houses were connected. On March 31st, 1897, the defendants gave notice to the plaintiff, in pursuance of section 16 of the Public Health Act, 1875, that within twenty-four hours they intended to enter on the premises owned by him for the purpose of relaying the sewer. On April 1st the defendants entered on the premises and took up the old sewer and made a new sewer 8ft. away from the site of the old sewer. The new sewer was laid deeper and had a different outfall. According to the plaintiff's case, the works executed by the defendants caused the buildings at the back of some of the houses to settle. He also complained that the defendants' men carted away some of the sand excavated by them. Section 16 of the Public Health Act, 1875, is as follows:—"Any local authority may carry any sewer through, across, or under any turnpike road, or any street or place laid out as or intended for a street, or under any cellar or vault which may be under the pavement or carriageway of any street, and, after giving reasonable notice in writing to the owner or occupier (if on the report of the surveyor it appears necessary), into, through, or under any lands whatsoever within their district." It was contended, on behalf of the plaintiff, that the notice given by the defendants was bad for the purpose for which it was used, as it did not state that it was intended to construct a new sewer, but only that it was intended to relay the old sewer. It appeared that, though a report showing the necessity for the new sewer was made by the sanitary officer, no written report was made to that effect by the defendants' surveyors. It

was contended, on behalf of the plaintiff, that the surveyors' written report was a condition precedent of the defendants' right to make the sewer.—In the course of the plaintiff's case, Mr. Macmorran, for the defence, intimated that, in answer to the plaintiff's first point, his point would be that for altering the course of an existing sewer no notice was required. The power to alter the course of a sewer was given by section 18 of the Public Health Act, 1875, which provides:—"Any local authority may from time to time enlarge, lessen, alter the course of, cover in, or otherwise improve any sewer belonging to them, and may discontinue, close up, or destroy any such sewer that has, in their opinion, become unnecessary. . . ." It appeared that the houses were in the occupation of tenants, and the defendants denied that any damage was done to the reversion by the alleged trespass.—Mr. Justice Hawkins suggested that it was a case in which it would be proper for the parties to come to some settlement. He was of opinion that the defendants had the right to enter on the land and do the work, and that, if in doing so any damage had been done to the premises, the plaintiff was only entitled to recover so much of it as was found to be damage done to the reversion.—Eventually, a *stet processus* was entered, it having been arranged that the defendants should pay to the plaintiff such damage as their surveyor should find to have been sustained, and that if the plaintiff should not be satisfied with the amount, he should be at liberty to take proceedings under section 308 of the Public Health Act, 1875, to have the amount settled by an arbitrator.

AFTER the rejection of the culvert scheme, for carrying the effluent from the Manchester City Sewage Works at Davyhulme to the Mersey, the Rivers Committee appointed a small sub-committee to consider the best method of dealing with the effluent. The report of this sub-committee has now been issued to the members of the City Council. The sub-committee has visited the sewage works in connection with London, Friern Barnet (Middlesex), Sutton (Surrey), Hendon, Chorley, Oldham, Swinton, Salford, Glasgow, and Accrington, and over sixty different schemes and appliances and about fifteen

suggestions have been fully considered. The general conclusions upon which the committee concur are:—(1) That filtration by land is altogether impracticable, as no part of the land at Davyhulme nor any land obtainable in the district is suitable for such process. They have visited the works of other authorities, and in all cases the land filtration is ineffective, and is in many cases to be superseded by artificial methods of filtration. The sub-committee think that the imposition of conditions by the Local Government Board which make the purchase of large areas of land for filtration compulsory should be removed. They suggest that all municipal authorities should combine to secure the removal of these impossible conditions by the appointment of a Royal Commission to investigate recent progress in sewage treatment. They believe that these conditions were based upon the report of a former Royal Commission which was founded on information now obsolete. (2) That no practical system of precipitation by chemicals alone has been laid before them which will meet the requirements of the Mersey and Irwell Joint Committee. (3) The sub-committee agree that of all the methods of artificial filtration, the nearest to natural action and most reasonably "practicable and available" for adoption is the biological filter, or bacteria bed, such as may be seen in operation at many of the places visited. They recommend the immediate construction of four acres of bacteria beds, and that the best available expert assistance be obtained in regard to the construction and working of the same. After completion of this area, and proof of cost, capacity, and efficiency, the progressive extension of the same to be made on an area large enough to meet the requirements of the daily normal flow of sewage. The sub-committee consider it necessary to take action in relation to certain liquid refuse which in its crude form is not admissible into the sewers. The City Surveyor's estimate for constructing thirty-seven acres of bacteria beds varies from £80,000 to £127,000, according to depth and mode of construction. The cost of working and maintenance cannot be estimated, as no place visited by the sub-committee has yet applied this principle for a sufficient length of time on such an extensive scale as to provide a basis of cost.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
April 9	Cookstown, Ireland—Court House	Grand Jury, County Tyrone	Secretary, Grand Jury, Curagh.
" 9	Margate—Agricultural Show Buildings	East Kent Agricultural Society	The Secretary, Canterbury.
" 9	Downpatrick, Ireland—Latrine	Guardians	Poor Law Offices, Downpatrick.
" 9	Eckington, Sheffield—Extension of House, &c.	Gas Company, Limited	Fisher and Sons, Architects, Eckington, Sheffield.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
April 6th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

A BILL to provide for the registration of architects has been introduced by Mr. Atherley-Jones, the object being to distinguish qualified from unqualified practitioners. The measure provides for the establishment of a general council, to consist of five members nominated by the advice of the Privy Council, three for England and Wales, one for Ireland, and one for Scotland, also architects chosen by various bodies as follows:—Five by the Royal Institute of British Architects, one by the Royal Academy of Arts, one by the Royal Institute of Architects, Ireland, two by the Society of Architects, and two by the Architectural Association. It is proposed to keep a register upon which the names of duly-qualified architects shall be entered. A penalty is proposed for the use of the title "architect" by unregistered persons, and admission to the register after January, 1899, is to be by qualifying examination. The bill further provides that none but a registered person shall hold a public appointment as architect.

THE chairman and secretaries of the National Trust for Places of Historic Interest or Natural Beauty write: "Will you permit us, on behalf of the National Trust, to support the appeal of the Bishop Suffragan of Stepney for Bow Church? This beautiful old building—which has now for two winters stood with a tarpaulin to cover the roof—is perhaps the last relic of Chaucer's England left in East London, and is now in imminent danger of falling into complete ruin. A little timely help is all that is needed to save it; and with a view to obtaining this, an admirable and most conservative scheme of repair has been drawn up by the Society for the Preservation of Ancient Buildings, and accepted by the Bishop's Committee."

SIR NOEL PATON, in joining the National Society for Checking the Abuses of Public Advertising, has written an interesting letter to the Hon. Secretary, in which he states:—"Quite recently the practical value of such a society has been illustrated in an interesting manner in our city of Edinburgh. We occupy what is not only a city of exceptional natural beauty, but a city from whose small heart has radiated the romance of history as it has from scarce another spot in the world. The weirdly picturesque stretch of our old town 'Piled deep and massy, close and high' as seen from Princes Street, has long been vulgarised in daylight by an offensive display of Brobdingnagian horrors in the shape of gilt letter-signs; but it still presents by night a marvellous picture, all but unchanged by the lapse of centuries, of the body which enclosed in days gone by 'The Heart of Midlothian.' This

picture—of which we are justly proud—was threatened by a desecration almost unthinkable to those who have eyes to see. We were challenged to stand upon our defence; but no hand was raised till our Cockburn Association sounded the alarm. Then our Lord Provost spoke with no uncertain voice; the citizens of every degree rallied round him, and the danger is past—let us hope for ever. But without such an Association we should have been voiceless, and the ancient dignity of our maiden castle and its mighty flanking ridge would finally have departed under the insensate and remorseless clutch of the modern Moloch of Advertisement."

AN important new building is to be erected in the neighbourhood of Dulwich—the Horniman Free Museum, which its founder, Mr. Frederick J. Horniman, M.P., intends to present as a free gift to the inhabitants of that neighbourhood. The new building will consist of two galleries, each upwards of 100ft. long, lighted from the top. In addition, there will be a large lecture hall, having a seating capacity for 300 persons. Altogether the museum, including the administrative block, will be some 300ft. in length, and will present a very handsome appearance, its front being constructed entirely in stone, with a clock tower of striking design, over 100ft. in height. The galleries will be divided into various courts, each devoted to a separate class of the interesting objects of which the museum proper consists. Thus there will be a pre-historical court, an Egyptian court, an Indian court, a Colonial court, a Japanese court, and so forth, while there will be special departments for the zoological and entomological specimens as well as for the large library. The new museum, of which Mr. C. Harrison Townsend is the architect, will be within three or four minutes' walk of Lordship Lane and Forest Hill railway stations, and will thus be in the centre of a rapidly extending neighbourhood.

CERTAIN effects of the late Sir John Millais were disposed of at Christie's a few days ago. The collection of bric-à-brac and Art furniture of the late President of the Royal Academy was not very extensive, but—as was only to be expected—it was of excellent quality. Yet the prices realised, quite apart from the intrinsic value of the associations clinging to all the objects, were in many cases astonishingly low. A large proportion of the porcelain and faience was obtained at prices averaging about one and two guineas apiece. The bronzes fetched better amounts, and one pair of Louise XV. ormolu wall light, with terminal figures of cupids bearing scroll branches for two lights each, ran to as much as sixty-two guineas—the highest bid of the sale. The President's Chippendale, Sheraton, and other Old English furniture went in several instances at unaccountably modest figures, though four old Dutch walnut-wood chairs, with high open backs, were only knocked down when fifty-nine guineas had been reached. The total for the whole collection was something like £390.

THE question of settling the site for the permanent erection of the Boadicea statuary group, by Mr. T. Thornycroft, which has been presented to the London County Council by Mr. J. I. Thornycroft, was considered at the meeting of the Council last week. The Committee recommended the Council definitely to approve the Westminster Bridge site for the erection of the statue, and to authorise the Highways Committee to make the necessary alterations to the Embankment wall to enable the group to be placed in position. An amendment that the consideration of the matter should be postponed for three weeks, and that, in the meantime, the opinion of the President of the Royal Academy, the President of the Royal Institute of British Architects, and the First Commissioner of Works should be obtained as to whether they could suggest an alternative site for the statue, was lost.—Mr. W. W. Bruce moved that the matter should be referred back, in order that the opinion of the President of the Royal Academy might be taken on the subject. He thought

that the statue was quite unworthy of the site, and read a letter from one of the most famous French sculptors, who said: "If we put that up in Paris we should be laughed at."—Mr. Campbell, in seconding, severely criticised the statue, and also adversely commented upon London statues generally. Referring to the City Griffin at Temple Bar, he asked: "Could there be anything more barbarously absurd than that?" The site of the Boadicea statue would, in his opinion, add still more to the vulgarisation of Westminster Bridge.—Mr. J. Burns said the Council had given the best site to the statue. That was the opinion of the man in the street. It was now suggested that the Royal Academy should be called in. To be a member of the Royal Academy was not synonymous with a knowledge of Art, as many would say whose canvases would be rejected on the morrow.—After further discussion the amendment was put, and on a show of hands lost, and the report was agreed to.

A SCAFFOLD has been erected at St. George's Church, Bloomsbury, for the purpose of cleaning its portico of Corinthian pillars. This grotesque structure was designed by Hawkesmoor, a pupil of Wren's, and was finished in the thirties of the last century. The plan is said to have been suggested by Pliny's description of the tomb of Mausolus; but, notwithstanding, St. George's has all along been voted the ugliest ecclesiastical building of any pretensions in London. The statue of George II., at the top of the steeple, was characterised by Horace Walpole as a "master-piece of absurdity," and was, with the monarch at the summit, satirised by him in the following lines:—

When Henry the Eighth left the Pope in the lurch,
The people of England made him head of the Church;
But George's good subjects, the Bloomsbury people,
Instead of the Church, made him head of the steeple!

THE War Office, among other expenses in connection with the sanitary and various arrangements belonging to the military system, propose to carry out at once an extension of the quarters at Falmouth at a cost of £10,000; the erection of a drill battery at Cardiff, £6000; the drainage of Horfield Barracks, Bristol, £3000; and other works in different directions which will run into some £50,000 or £60,000. The whole of the work is to be completed within the year.

THE latest addition to the suburban playhouses will be the Kennington Park Theatre. The auditorium will have an average depth of 70ft. and a width of 60ft., and will be constructed on the two-tier system. The theatre will be heated and ventilated throughout on the plenum system, and fresh air of the required temperature will be distributed by flues and channels to the different parts of the house, the used-up air being forced out by means of exhausts. A complete set of hydrants and fire appliances will be arranged, and the stage is to be fitted with a double asbestos and steel fireproof curtain, controllable by one man. The latter is designed to be one of the largest in London—namely, about 80ft. wide and 50ft. deep.

THE Duke and Duchess of Fife's new residence, Mar Lodge, is getting on apace, and, owing to the open winter, is likely to be ready for occupation early in the autumn. Fine picked specimens of woods from the neighbouring forests have been largely used in panelling or in making balustrades and doors, and some of the pine and birch is quite equal in beauty to Oriental timber. The drawing-room is to be in the Adams style of decoration, and pink is the all-prevailing shade; even the tiles of the fireplace are to be of that delicate colouring. For the entrance hall, staircase hall, large and small dining rooms, Messrs. A. J. Arrowsmith and Co., of 80, New Bond Street, W., are supplying handsome plain oak Parquet flooring. Mr. A. Marshall Mackenzie is the architect; Messrs. McRobbie and Lulue are the contractors.

At the meeting of the London County Council last week the Improvements Com-

mittee reported that they are proceeding with the reference made to them by the Council in November last to consider the desirability of continuing the embankment of the Thames from the Victoria Tower Garden to Lambeth Bridge. Since the reference was made the promoters of the Victoria Embankment Extension and St. John's Improvement Scheme have deposited plans and a Bill in Parliament providing for an extensive private enterprise in laying out a large area of land in the locality in question, and the Council has already decided to present a petition against the Bill, and to take the necessary steps to secure opposition on the second reading. The Committee were not yet able to bring up a complete scheme of improvement such as they could recommend to the Council, neither was it possible for them to submit plans, or even approximate estimates of the cost, as the preparation of such an important scheme would necessarily involve much time and careful consideration. It had, however, been suggested to them that as the St. John's Improvement Bill was down for second reading last week, it was desirable that they should at once advise the Council to give them some definite instructions with regard to the formulation of an improvement scheme. Accordingly they asked the Council to pass the following resolution:—"That it is desirable that the embankment of the Thames from the Victoria Tower Garden to Lambeth Bridge should be undertaken by the Council, and that it be referred to the Improvements Committee to prepare and bring up a scheme for the consideration of the Council at the earliest date practicable, such report to deal with the question of the widening of Millbank Street and the utilisation of any surplus land which remains after carrying out the improvement." The Council, however, did not accept this recommendation, but adopted the following amendment:—"That it be referred to the Improvements Committee to prepare and bring up at the earliest date practicable a scheme for the embankment of the Thames from the Victoria Tower Garden to Lambeth Bridge, including the widening of Millbank Street, and the utilisation of any surplus land which remains after the carrying out of the improvement."

AFTER the gold-plated staircase and balcony that adorn Mr. George Gould's house at Lakewood, New Jersey, a stairway in Numidian marble seems hardly worth even a passing mention. But this is not quite so simple a thing as it seems—in cost, at all events. It is to decorate the new million-dollar mansion of Mr. Elbridge T. Geary, and is to cost the trifle of some £20,000, or at the rate of £500 a step. Its appearance is described as being hewn out of one single block of Numidian marble. At the bottom, on each side, are knights in armour holding torches of electric light.

VISITORS to the Teign Valley, especially those of an antiquarian turn, will have much to interest as well as to exercise their minds when examining the painted panels in the Lady Chapel of Ashton Church. These are six in number, and are of an undoubted pre-Reformation period, but how, when, and by whom placed there no one seems to know. Each panel has a different type of face, and may well indicate and illustrate the varied orders or ranks amongst the clergy of the Medieval Church. They are bold in outline, and are wonderfully well preserved. The new rector has done well to replace the Old Elizabethan pulpit to its former position near the beautiful chancel screen. For years it has been disused and relegated to a back corner in the nave of the church.

An important point was involved in a decision given at Aberdeen a few days ago. A house carpenter sued a shipmaster for £29 19s. 3d. Pursuer had contracted to build two dwelling-houses for defender at the west side of Balmoral Place, at the price of £1605, according to plans which had been submitted to him and specifications mentioned in an agreement. The plans showed a depth of

2ft. for the foundations of the houses, but it was found necessary by the pursuer, in order to get a solid foundation on the level, to excavate to a greater depth than 2ft., and he had therefore more mason work to build than he bargained for, and had in consequence to pay his sub-contractor £21 12s. 6d. extra. The balance of the amount sued for—£8 4s. 9d.—was made up of extras, which defender, however, offered to pay. Sheriff Robertson has issued an interlocutor giving decree for £8 4s. 9d., but finds that, as regards everything beyond that, the action is irrelevant, and is therefore dismissed, the defender being entitled to expenses. His Lordship, in a long note, says that, taking the legal position, it appeared to him to be quite clear that where there was an agreement to do any particular job for a lump sum, and the house has only to be taken over when finished, that the contractor had to do everything necessary to complete the whole, and what was necessary could not be considered as "extras," and the builder or contractor would not be paid for them above the contract price. The result was that if there was a lump sum contracted for to erect a building with no schedule of quantities, the builder took the risk, and he was the loser if there was any defect in the soil, and if there are mistakes in the calculations, and it was not sufficient that he builds according to the plans and specifications, if he did not thereby supply everything.

WRITING to the Times, Mr. Walter Cave, architect, says:—"The flagrant injustice of the remarks made by Sir W. Harcourt, on the New Scotland Yard building, in the debate in the House of Commons, must have caused a feeling of hopeless despair in the hearts of all artists in this country. If a design (which is considered masterly by those who understand these matters) is thus abused without a protesting voice from those in whose hands the Government building scheme rests, what hope is there for these new sites which have cost so much to acquire?" In a letter upon the same subject Mr. Walter Crane says:—"I quite endorse Mr. Cave's view of the fine qualities of Mr. Shaw's design, and agree with him in deploring the general ignorance or indifference to architectural design in high political places, although I must confess I did not see Sir W. Harcourt's remarks, and was not aware he was a great architectural authority. The notion, however, that architectural design consists chiefly in furnishing a sham Classic (or Gothic) façade to mask complex internal arrangements on a ground plan which has no relation to any historic style seems to me a most hopeless and injurious one. I believe the most competent architects always endeavour, by meeting the actual practical requirements and uses of a building, to give it character and expression, or rather to let its artistic expression be the natural outcome of its adaptation to human wants."

STILL another letter on the same subject. Mr. W. A. S. Benson writes:—"The architectural conundrum propounded by Sir Wm. Harcourt is complicated in a manner that has, I think, not yet been noticed, by the fact that Crosse and Blackwell's is also an exceedingly good building. Neither building is much bespattered with the archaeological tags that usually pass for architectural style, and by the presence or absence of which most people judge of a building. The number of those who are capable of appreciating a new work of any nature with reasonable perception is always very limited; most are content with prejudice and secondhand opinion. But of those who do care enough for Architecture to form their own opinions, I should judge from what one has heard said at one time and another that a large majority of votes would accrue to New Scotland Yard as the best exterior among recent public buildings, and I suspect that the School Board offices would take the second place. The Science and Art buildings in Exhibition Road, by the late Capt. Folk, would probably take a good place, though their style is a little out of the main trend of the effort of the day. The new Admiralty buildings would be much better if

they did in fact harmonise with the Architecture of the old buildings, which are not without their measure of quiet dignity if only they could be cleaned once in a generation or so. Poor Somerset House has been horribly disfigured by a yellow brick excrescence, overtopping the façade at one end; the sort of fate that is too apt to overtake fine buildings in our careless city. Somerset House is, indeed, a masterpiece which cannot be repeated on demand; but there are many grades of excellence that we might hope to attain and avoid sinking to a zero of imbecility, or below it to the wanton mess of forcing a Gothic archaeologist to build a Renaissance palace. That thinking men are agreed as to the futility of competitions, and there is no infallible method of securing the employment of the best artist; but probably the method of getting the practical requirements thrashed out by a committee with professional advisers who are not to be the final designers, offers a fair approach to the best procedure, provided the actual and responsible architect is called in before the plans are rigidly crystallized. For selecting the final architect, those who signed the manifesto in the Times would probably be as good a committee as could be named."

THE Metropolitan Asylums Board, at its last meeting, received the report of Mr. T. W. Aldwinckle with regard to the contract for alterations and additions at the South-Western Hospital. He stated that the total account came to £28,857, an excess of £4557 on the sealed contract. In explanation it was stated that additional foundations were found to be absolutely necessary, while it was impossible to re-use any of the old laundry machinery, thus causing extra expense on engineering work. Drainage was responsible for £586; but £370 was due from the Lambeth Vestry in respect of the new laundry wall. The report was referred to the Finance Committee.

THE Dean and Chapter of Westminster Abbey have passed a resolution re the Victoria Embankment and St. James's Improvement Bill, declaring that they wish to offer their strongest opposition to the measure on the following, amongst other grounds: That a great number of dwellings of the labouring classes ought not to be destroyed without preliminary provision being secured for the erection of buildings adapted to the same classes in the same neighbourhood, and that a site so contiguous to national and historical buildings should not be dealt with by a private company.

THE removal of the Liverpool churches of St. John, Old Haymarket, and St. George, Castle Street, whose demolition, it is generally agreed, will greatly improve the architectural aspect of the spaces in which they are situated, is, it seems, in the hands of the diocesan authorities, and is being managed for them by Messrs. Gamon, Farmer, and Gamon, solicitors, Lord Street. By the terms of the Act under which the sites have become the property of the Corporation, the ecclesiastical authorities are bound to remove both buildings within two years from July 15th, 1897. As a result, both churches are now on sale. A scheme was set on foot for the removal of St. George's Church to a site in Walton, but the idea had to be abandoned on account of the prohibitive expense. The fabric of this church, exceptionally heavy and solid in construction, includes enough hard white stone of the finest quality to build two modern churches of considerable size. There is also an organ of comparatively recent build, and a quantity of woodwork, a portion of it mahogany. If possible, the building will be sold as it stands, and, failing a reasonable bid within a certain period, will probably be offered at auction, either in one lot or in sections. Several inquiries from possible buyers have already been received from different parts of the country. As to St. John's Church, the fact of the building being merely sandstone, and without the architectural pretensions of St. George's, makes it very unlikely that it will realise anything more than an old song, its value being simply the worth of the old materials.

Constructional Steelwork.*

By T. C. CUNNINGTON.

(Continued from page 151.)

A FURTHER recommendation of the use of cement lies in the fact that the thermic expansion of Portland cement is practically the same as that of steel, a fact which ensures perfect cohesion under any changes of temperature. It has been suggested to rely entirely upon the preserving qualities of cement rather than upon a proper painting of the metal work. Prof. Bauschinger states that his experiments show a cohesion between steel and concrete after hardening of from 570lb. to 640lb. per square inch, which is more than the tensile strength of good concrete; but in building work a perfect union between the cement mortar and metal work can never be attained at all points, and a thorough coating of paint must largely be relied upon.

All constructional steelwork should therefore be well coated with either lampblack mixed with oil or red lead and linseed oil, the very best of materials being employed. The oxide of iron or mineral paint which has generally been specified for all painting of the metal work has been found to separate from the steel, and form an oxidation of the metal behind the paint. A mixture of red lead and linseed oil is now considered as the best protective coating for iron or steel.

Having regard to their importance in steel construction, we have dealt somewhat in detail with columns and stanchions, together with their foundations. We will now proceed to deal with girders, their connections and bearings, and the various forms of floors.

In designing a building numerous cases occur where a single joist-girder will not be suitable, and it may be necessary to increase the length of the spans, so as to reduce the number of the supporting columns or stanchions to the minimum; or perhaps heavy, concentrated loads, such as columns, stanchions, brick walls, chimney breasts and stacks, necessitate the introduction of plate and angle-ripped girders, or compound girders of joists and plates. Having calculated the loads on the several girders, it is an easy matter to determine the sections most suitable to the purpose. It frequently happens in designing a building that excessive loads are concentrated at two or more points of the floor, and in order to confine the construction within the limits of the design without increasing the sections where the minimum loads occur, recourse has to be had to various methods. The depth of the girder being reduced to the minimum in order to obtain the required strength, the flanges of the girders must be unusually wide, the webs well stiffened or trussed. An illustration of this occurs in the ground floor ceiling of the West Australian Bank, Cornhill, as also the ceiling of the news-room of the Shoreditch Library.

Where the ends of the girders rest upon the wall, it is advisable to use steel bearing-plates or joists to distribute the pressure over a greater surface, and thereby prevent the crushing of the material in the wall directly under the girder. In most cases a large tough stone will be sufficient, but where the pressure is heavy both plates and stone should be used. The average pressure per square foot for brickwork should not exceed six tons, and for stone twelve to twenty tons, according to its character. In calculating for loads upon girders where the bricks are laid regularly the probable line of rupture (providing the girder should fail) will be found to be inside of the sides of an Isosceles triangle, whose base is the span, and whose height is one-third of the span. In order to be entirely upon the safe side the weight of the wall between vertical lines directly over the girder, for a height equal to that of the triangle, is frequently adopted as the load to be carried. However, it should be noted that for green walls, or walls having openings, this rule does not apply, as the full height of the wall

between the points of support must be provided for.

Where the width of the walls, either internal or external, exceeds 14in. that are supported by girders, it is advisable to use compound girders or plate girders, and where plate girders it is preferable to have them double webbed, or box girders, the latter giving greater stability than the single web girder. In all built girders it is advisable that the flanges alone are to be considered as resisting the bending moments, and both flanges nominally of the same section. No angles used smaller than $2\frac{1}{2}$ in. by $2\frac{1}{2}$ in. $\frac{5}{8}$ in., and no webs of less thickness than $\frac{1}{4}$ in.

Stiffeners of tees and angle bars must be used where the depth of the girder is above a certain ratio in proportion to the web (say

SECTIONS OF "STEEL FLOORS"

seventy times), and disposed so as to resist the shearing forces upon the web. In all cases it is absolutely necessary that they are provided at all bearings, and at points of concentrated loadings, and where straight stiffeners are used (they being preferable in girders for building work) the ends of them, both top and bottom, must fit closely against the flange angles in order to fulfil their proper functions.

The safe loads for steel joists are given in the various merchants' catalogues, as also for compound girders made of joists and plates. In designing compound girders, say of two joists, with plate top and bottom, take the safe load given for the two joists, making due allowance for the quantity of material taken

from the flanges in the rivet holes, and the difference must be provided for in the sectional area of the plates. The distinct functions of the flanges and webs of all girders with thin, continuous webs are that the whole of the horizontal strains must be provided for in the flanges, the web practically taking no part in resisting them, neither are the horizontal flanges considered to take part in resisting the shearing forces, the whole of which must be provided for in the webs.

In selecting joists for girders, or similar purposes, the proportion of depth to length should not be less than one-twentieth of the span, otherwise deflection may take place.

Due allowance must be made for all holes drilled in the joists for connections, &c., more especially for such that are placed in the flanges. The depth of plate girders should be one-tenth to one-sixteenth of the span; the greatest economy of material is, perhaps, obtained at one-twelfth. For continuous girders, or girders fixed at the ends, the depth may vary from one-fifteenth to one-twentieth of the span, the width of the flange not less than one-thirtieth to one-fortieth of the span, and no plates should be less than $\frac{1}{4}$ in. thick.

The general formula for plate girders of this class is $S = \frac{WL}{8D}$

S = Strain on top and bottom flange at centre in tons.

W = Weight distributed in tons.

L = Length of girder (or span) in feet.

D = Effective depth of girder in feet.

Steel may be strained to seven tons per square inch in tension and compression, although some authorities limit it to six tons per square inch.

FLOORS.

Before considering the most economical arrangement of steelwork for floors, the question of loads, which very largely governs the design of the floor system, must be examined. The loads in building construction may be classified as dead, live, and eccentric loads, the principal affecting the floor systems are:—

Dead loads, comprising all of the static loads due to the constructive parts of a building, stationery machinery, water tanks, or other permanent loads.

Live loads comprise the people in the building, office furniture, moveable stocks of goods, or varying loads of any character.

The maximum live load per square foot is usually assumed as follows:—

For Crowd of people	80lb.
„ Floors of houses	40lb.
„ Theatres and churches	80lb.
„ Ballrooms and drill halls	90lb.
„ Warehouses, &c.	from 250lb.
„	upwards.
„ Factories.....	200 to 450lb.

while 80lb. is the maximum possible live load per square foot for a crowd of people (unless dancing be considered). Still, we can hardly expect to realise any such load under the conditions governing an office building. Large crowds very seldom collect in offices, except on the lower floors devoted to stores or banking purposes, and greater allowances are generally made for such places. The ordinary office furniture will certainly not exceed and seldom equal the weight allowed for persons, and hence additional security is introduced. These loads used in the calculations affecting the girders, columns, and stanchions, must not be confounded with the required loads for the strength of the individual floors, while the live load per foot super may be reduced over large areas in proportioning the girders and columns. The maximum possible live load must still be used when any single floor is considered by itself.

The practice in America seems to be pretty well defined in the matter of decrease of live loads per square foot, as they are transferred from beams to girders, from girders to columns or stanchions, and thence down the columns to the footings. This practice is founded upon the supposition that it is quite possible that the beams may sometimes have to carry their full capacity in live loads, while the chances are increasingly less that the girders or columns will ever be required to carry any

* Paper read before the Architectural Association on Friday, March 25.

where near their full capacity if a full load had been assumed. The fully loaded area would probably never be large, and a girder or column would rarely, if ever, lie in the centre of such area. The effect of a live or moving load, causing vibration in the parts of a structure, is also gradually lessened, as the vibration, if any, is taken up in the transfer of the load from member to member, so that by the time it reaches the footings, or foundations, the live load is ignored entirely.

As examples of this system of calculation the following may be mentioned. In the Venetian building in Chicago the beams were calculated for the following live loads:—

Upper floors per foot super	35lb.
Second, third, and fourth floors super	60lb.
First floor super	80lb.

Girders carry 80 per cent., columns 50 per cent. of the loads.

The weight of the steel girders and brick or tile partitions are actually calculated for a typical floor plan, and then rated at so much per square foot of floor surface. The dead loads assumed in the old Colony Building, Chicago, compressed:—

Flooring	4lb.
Deadening	18lb.
Tile arches	35lb.
Iron	10lb.
Plaster	5lb.
Partitions	18lb.
Total	90lb. per foot super.

giving the following results:—

	Beams.	Girders.	Columns.	Footings.
Live loads...	70	50	40	—
Deadloads...	90	90	90	90
Total	160lb.	140lb.	130lb.	90lb.

In the administrative block of the Royal Infirmary, Liverpool, which is five floors high, a similar system of calculation was adopted in regard to the strength for the lower columns and girders. In floors generally one of the main points to be considered is that they must be firm and rigid, at the same time as light as possible and subject to no vibration; to ensure this desideratum the joists must be of adequate depth.

With the several systems of fireproof floors we do not now propose to deal in this paper, as the subject is so comprehensive that it is desirable to deal with it separately.

STEEL FLOORING.

(The several systems of steel flooring, each having some special features and more suitable for particular purposes; taking the several sections illustrated on the sheets in detail.)

No. 1 is flooring made of steel trough bars of various sections and weights per foot from 4½ in. to 12 in. deep; the depth of the 12 in. section can be increased to 15½ in. deep by the addition of a bar. The sections up to 12 in. deep are rivetted together on the neutral axis, and the sections over 12 in. deep require two rows of rivets. This steel flooring is used in the floors of the National Liberal Club, Prudential Buildings, Holborn, Bishopsgate Goods Depot, and in a number of other buildings not necessary to mention.

Section No. 2 (Messrs. Wm. Lindsay and Co.) is rolled in depths 10 in., 12 in., 14 in., and 18 in. if required. In this section it will be observed the rivetting is on the top and bottom flange.

Section No. 3 is either rolled or pressed in several depths and strengths, and is used, as shown in illustration No. 4, with plain bar rivetted to both top and bottom, the edges of the troughs abutting. It is also used, as shown on illustration No. 5, with the troughs lapping and one row of rivets top and bottom.

Section No. 6 is a simple form of flooring, composed of plain plates and angles rivetted and connected as shown. It can be made any strength, depth, or span by increasing the sectional area of the plates and angles, or by increased depth. It is nominally the same price per ton as the other section. Where the ends bear upon the walls, steel or iron bearing plates must be provided, and it is advisable to

keep these plates a little distance in from the face of the brickwork.

These several classes of flooring can be fixed either upon the top or bottom flange of the girders, or upon angle bars that are rivetted upon the webs of the girders, and bolted down. These floors are well adapted for warehouses, factories, mansions, and public buildings, or in any situation where great and variable strains occur either by crowds or the vibration of heavy machinery. The strength of these steel floorings when rivetted together is considerable, as each trough may be treated as a girder; as the whole is rivetted together, no one portion can deflect without dragging down the adjoining troughs for some distance from the point of application of the weight.

At this stage it would not be advisable to go into the question of the finishing of the floors, as we consider it ought to be treated separately, or dealt with in a special paper. As before mentioned, in order to render a building fireproof where steel construction is used, it is absolutely necessary that every member of the construction must be thoroughly and adequately encased in some fire-resisting material, so as to remove the metal from the direct action of the fire, and if this particular is insisted upon we shall not have such lamentable catastrophes that continually occur, more particularly in city buildings.

We have not now time to discuss the very important subject of roofs, as it is one that requires to be treated also in a paper entirely by itself, from the fact of it being so comprehensive. The roof of the town hall of Oxford Municipal Buildings is an example of construction whereby the ceiling can be kept as high as desired, at the same time keeping the side walls down to the minimum. The same principle is also shown in the proposed detail of principals for roof over first-class swimming bath at Shoreditch Baths.

The only further example that may be referred to is the Gymnasium Roof at Kingham Hill, which stands independently of the walls, part of them on plate girders, 40 ft. span, and the remainder on the usual stone templates. In conclusion, although I have dealt with the subject somewhat in detail, and given examples of practical work, most of them being works executed, a great many points in reference thereto have not been mentioned, more particularly "independent structures," "bracings," and questions analogous thereto; but having had the opportunity of laying the subject before you, I hope it may prove an incentive, and receive that attention which so important a subject demands in connection with the practice of the architect.

Mr. H. W. Pratt (President), in opening the discussion, said if engineers had more to do with constructional steelwork than architects, it was the fault of the latter, through not studying the engineering part of the construction of buildings more than they did. He thought it was desirable that, as architects, they should look a little more closely and deeply into the engineering department of their work. Life was too short for them to go into the subject thoroughly, but they ought to understand the principles with regard to these things, and if they had not the time and opportunity of working out the strains and stresses of different forms of construction, yet they should not entirely neglect the subject to place full reliance in the engineer. A short time ago the Discussion Section was debating the relation of the engineer to the architect and the architect to the engineer, and the general feeling of the meeting was that architects and engineers should work more together, that architects could not do without engineers, and that engineers could not do without architects. At the rate iron and steel construction had been going on within the last ten or twenty years, architects had been left considerably behind in the race. The engineers had overtaken them, and architects were necessarily compelled to call in their aid. Mr. Cunningham, who was an old member of the Association, was trained as an architect, but left the Profession and allied himself to engineering. There was one point upon which he disagreed with him, namely, his reference

to the application of architectural detail to engineering construction. He thought it was a pity that engineers did not leave Architecture alone when it was applied in the manner suggested. As architects, they would prefer that architectural forms of caps and bases were left out of iron construction in that way, because it was very evident it was not the proper treatment. If engineers thought their work could be made architectural by the application of forms in that way they were mistaken from the architect's point of view.

Mr. Richard Morland remarked that an important point for study was to design so as to have girders with as large a span as possible, in order to use as few columns as they could. With regard to fireproof construction, he said he considered porous plaster was the best, as it was non-conducting. They would notice that in fires, plaster, if well made, often broke the construction it covered. He thought it was possible to make a covering for iron work in porous material.

Mr. Gifford Reed spoke upon the necessity of a thorough knowledge of the subject, not only from a scientific point of view, but also of the calculation and theoretical part. They must know the trade, and the habits of the trade. Recently he was designing a certain column of square section of simple form to carry four arches. He went to ascertain the price, and it came to about £25 per ton, but on looking into the matter and using other columns, he was able to get the work done for £5 or £6 less per ton. With regard to foundations, the system adopted in the Marguerite Building, Chicago, referred to by the lecturer, was very largely carried out in the city, because it was lying almost upon a morass, on the top of which was a layer of hard clay. After getting through this layer of clay they would have to go 60 ft. before reaching the hard clay again, and therefore it was very desirable not to break through the upper crust, hence the necessity for spreading out the foundations to give as little pressure per foot as possible upon the upper clay. The same thing was done not long ago at St. James's Square, London, where the new buildings were sunk lower than the old ones, as they found a bed of very soft sand, and the foundations had to be taken down a good depth and a large mass of concrete put in. The old houses were very high, and they were simply founded upon the top clay, which was sufficient to hold them up, he daresay, quite as well as the foundation would the new buildings. The speaker preferred round columns for carrying loads, but it was a matter of some difficulty to attach girders at any point of them. Dealing with the lecturer's observations on painting ironwork, the speaker mentioned that he had had a good deal of experience with oxide paints, and found, when he analysed them, that very few were oxide. If they used a paint of 60 per cent. pure oxide and well treated with pure linseed oil, they would have a paint for ironwork that he guaranteed would not scale off—a paint that would run easily, and would cover twice as much as the ordinary oxide paint. Of course, in painting ironwork it was very necessary to see that it was perfectly clean, and that the scale was off, otherwise, if the scale was painted over, it came off together with the paint. He did not think rust would go on behind a coat of paint unless the paint was porous. Adverting to the question of the relationship of the architect and the engineer, Mr. Reed said that generally architects were dealing with materials which had been used for ages in the construction of ordinary houses and dwellings, and even in these days, they preferred to build in brick and stone rather than in iron. When an architect had a brick or stone building to erect, for instance, in any one of the streets of London, he might have as beautiful and artistic a design as it was possible to carry out, but there was always something to come in and hinder, or rather obstruct, the legitimate use of that particular material with which he was working, brick, terra-cotta, or stone. Nowadays there was a demand for so much light and room, and therefore, if building a shop, he had to have a large front, with a large open space behind. Consequently he

had to take advantage of new and modern material to assist him over his difficulties, which he would not get over so easily by using his own legitimate material, brick or stone. He had heard architects deprecate iron and steel construction, as being used so much nowadays, but it was of great advantage if used properly. It enabled the architect to span over large spaces, and to go on with the architectural treatment by painting or by covering with plaster, &c., and to make the design satisfactory to himself and secure the strength that would not be obtained in the other material. Iron and steel could also be employed as decorative material, and that was where they would find it easily adapted for the various kinds of roofs. It was very necessary that engineers should also know something of Architecture, but perhaps it was more necessary for architects to have a knowledge of engineering.

Mr. Banister Fletcher, proposing a vote of thanks to Mr. Cunningham, recommended a glance at the roofs and galleries of the Paris Exhibition for beautifully shaped stanchions. He did not think engineers had much to flatter themselves about in the use of iron as a fireproof material. They could not expose it anywhere in a building if they wanted it fireproof, and therefore had to conceal it. It seemed to him that box girders was a mistake, unless they could get inside to paint them, otherwise they could not be painted more than once. Whilst paying all due respect to the engineers, the speaker regarded many of them as interlopers, for a great deal of the work done by them was legitimate architectural work.

Mr. E. H. Brodie seconded.

Mr. M. Fawcett said he had abandoned the architectural profession for that of a constructional engineer.

Mr. Cunningham, responding to the vote of thanks, urged the advisability of the architects and engineers working together.

The foundation-stone has been laid of the new infirmary being erected on Highgate Hill by the Islington Board of Guardians. According to the plans of Mr. William Smith, the architect, the infirmary, when finished, will consist of five blocks, the central one being destined for the administrative departments, the kitchen and stores, while on either side, at right angles to it, will be two blocks, containing in all sixteen wards of thirty-two beds each, six of thirty, and six of eighteen beds, providing for 800 patients. The lowest estimated cost will be £200,000.

As a memorial of Lady Victoria Long Wellesley, to whose generosity the erection of the present church of All Souls at Eastbourne is largely due, a series of six stained glass windows have been placed in the apse—three on either side of the centre light. This centre light comprises the figure of our Lord as "the Good Shepherd," and the verses of the 23rd Psalm are enshrined in six of the panels below the windows of the apse. The pastoral type of the original memorial has been extended to the memorial to Lady Victoria herself. The central figure of our Lord as the Good Shepherd remains exactly as Lady Victoria left it, but the top of the panel and the ornamental work above and below have been assimilated to the new windows, so as to ensure harmony of treatment throughout. The shape of the window spaces—long and very narrow—made it advisable that the figure scenes should occupy panels only, the space above and below being filled in with ornamental work, and as the existing ornamentation in the sanctuary consists entirely of conventional forms of foliage and flowers, the same method has been allowed in the new windows. The artistic aim all through has been to make the windows as little conventional in style as possible. The figures are in perfect drawing, the countenances are fully studied, the grouping good and the perspective excellent—in fact, the panels are true pictures which tell their own story. In the decorative work, too, care has been taken that every stem leaf and flower shall be natural—only as Mr. Ruskin would say, "in service" i.e., bending its stem and grouping its leaves and flowers in accordance with the space to be occupied.

KEYSTONES.

THE Plans Committee of the Aberdeen Town Council have just passed twenty-two sets of plans of property, representing a total of £53,000. The plans were principally those of tenement houses.

THE new Market Hall, recently constructed in Dockray Street, in the borough of Colne, has been opened. The building has cost altogether, with the land, the town's market ground, and the fish market, about £9000.

A FURTHER extension of the Church House, Westminster, is contemplated. It will consist of nineteen rooms, with a hall for the assembly of the House of Laymen. The new work is already completely planned, and it is to cost £18,000.

THE West Ham Town Council has adopted the plans prepared for the new museum to be erected on the site in Romford Road adjoining the Institute. The buildings, which have been designed to harmonise with the Institute, are estimated to cost £4000.

ANOTHER old hostelry is doomed. This is the Crown at Plaistow, an inn which is said to have been erected four hundred years ago, and which will cease to exist when the new building, now in course of construction, is completed.

THE Shipley District Council has decided to invite four architects to prepare designs for new offices, fire brigade station, baths, stabling, &c., and that they be paid a fee of twenty guineas each, except the successful competitor, who will be paid by commission.

A NEW altar has just been erected in the church at Borris (county Carlow). The work, which is in pure white Carrara marble, has been designed and executed in the richly-wrought style of the fifteenth century, under the superintendence of Mr. M. J. C. Buckley, Kilkenny.

THE Jodrell Arms Hotel, at Whaleybridge, Derbyshire, is being rebuilt and enlarged. The front portion, which was supported by girders and pillars, and on which several men were working, suddenly collapsed a few days ago. It is supposed that the girders which supported a division wall between floor and roof gave way.

IMPROVEMENTS are to be carried out at Lord's Cricket Ground. The old tennis court with the adjacent buildings is coming down, and the corner of the ground next to St. John's Wood Road, where these buildings stood, is to be banked round. A new tennis court and a new racquet court are to be built behind the pavilion.

PLANS have been prepared for the completion of St. Matthew's Schools, Blackburn, by the erection of a north wing abutting on Withers Street and Cambridge Street. This wing, with the adjoining class-room, will provide accommodation for 250 boys. The estimated cost of the proposed extension is about £2000.

A FEDERATION of Master Builders' Associations in Lancashire and Cheshire has just been concluded, and the rules will shortly be issued to the members of the trade in the two counties. The new organisation is formed on the lines of the Engineering Employers' Federation, and its affairs will be controlled by an executive council, the first president being Mr. R. Neill, of Manchester.

A LOCAL GOVERNMENT BOARD inquiry has been held in Nottingham with reference to the proposed demolition of houses in connection with the scheme for a new street from Lower Parliament Street, traversing the site of the old gaol in John Street, to St. Ann's Well Road. It was stated that nearly 300 houses of the smaller class would be required, and would be demolished a few at a time.

THE Lambourn Valley Railway, which will bring the old world town of Lambourn and a number of villages into direct connection with the Great Western system at Newbury Junction, passes several places which have not as yet had the advantage of railway accommodation, including Speen, Stockcross, Boxford, Welford, Stefford, East Garston, and East Bury. The works have been carried out by Messrs. Pearson and Co., of Westminster.

Professional Items.

BIRMINGHAM.—Mr. Thomas Sergenson is about to proceed with his scheme for building a new theatre in Birmingham. To Mr. Frank Matcham, of London, has been allotted the task of preparing the plans. The total area of the site is 2800 square yards. The building will be arranged on the most approved lines, both in regard to the auditorium, stage equipment, and other respects, whilst the elevation will be of handsome and imposing design. The main entrance will be placed at the corner of Ryder Street and Corporation Street, but the whole extent of the frontage in the latter thoroughfare will be devoted to shops of a first-class character—eight in number—with either residential chambers or offices above, a lift and other appliances being provided for the accommodation of occupiers. The property on the Dalton Street side of the building will be utilised as warehouses and business premises of similar description. The stage will be of large dimensions, 70ft. wide by 45ft. deep, with the necessary dressing-rooms, scene-dock, dynamo-room, &c. The pit, which will be on the floor-level, will provide accommodation for 800 persons, with 150 stalls immediately in front. The dress-circle and stalls will be reached by means of a spacious vestibule and staircase in marble and mosaic. A decided novelty will be noted in the placing of the private boxes—five of them—at the extreme back of the circle, instead of at the sides nearest the stage, as has been the practice for many years, though there will almost of necessity be a couple of stage-boxes in the accepted position. The dress-circle will seat 275 persons, which, with the twenty-five provided for in the boxes at the rear, will bring up the accommodation in this part of the house to 300. In addition to this, a capital view of the stage may be obtained from a commodious lounge and promenade, extending from the ends of the circle to the stage-boxes on either side, fronted with richly-decorated Moorish alcoves, which, in themselves, will greatly add to the architectural beauties of the interior. The scheme of decoration will be Moorish throughout. The total cost of the building is estimated at something like £50,000 or £60,000.

BOGNOR.—Mr. Boddie, of Aberdeen, was the successful competitor for a fountain to be erected at Bognor. The fountain will be about 13ft. high, and on each side is formed a projecting moulded basin. The upper part of the die-block is of octagon shape. On it rise four pillarettes, supporting a circular canopy, consisting of frieze, cornice, and dome. The finial will consist of a copper Imperial Crown. Enclosed by the pillarettes is a miniature fountain playing from a granite basin, which will have more of an ornamental character as compared with the usefulness of the jets. The fountain will be constructed of Rubislaw grey granite, except the drinking basin and the pillarettes, which will be in pink Peterhead stone.

BOSTON.—The foundation-stones of the new Wesleyan Sunday Schools at Boston have been laid. The contract for the erection of the building has been obtained by Mr. W. Greenfield, of Boston, and the cost is estimated at about £2000.

FRASERBURGH.—Fraserburgh Parish Church is to be improved. Mr. A. Marshall Mackenzie, Aberdeen, has prepared plans and specifications for the carrying out of the work, which will cost about £2000. The steeple is to be heightened and a porch added to the front, while new cornicing, pinnacles, and balustrades are to be placed in the front of the building. The interior of the church is to be completely reconstructed. The pulpit is to be shifted to the east end in an apse, which is to be built over the present vestry. The church is to be lighted with leaded lights, while the roof is to be reconstructed and formed with an arched ceiling.

HUNTINGTOWER.—A new church hall at West Huntingtower is to be built in connection with the Tibbermore Parish Church. The building will consist of a hall 54ft. by 31ft., with retiring rooms, the length of the whole building being 73ft. and the breadth 35ft. The plans have been prepared by James Smart and Son, 3, New Scott Street, Perth, and the work will be carried out under their charge. The following are the successful contractors: Mason work, J. and P. Keay, Methven; joiner work, T. D. Falconer, Perth; plumber work, William Frew and Sons, Perth; slater work, James Buchan, Perth; plaster work, Alexander M'Ritchie, Dundee.

ILKESTON.—A new Wesleyan chapel has just been opened at Ilkeston. The new chapel, which is of Gothic design, with east window, has four entrances to spacious lobbies. It is constructed of red bricks, with terra-cotta and stone dressings, and has a tower and spire 120ft. above the street level. The final decorations are surmounted by a Jubilee cross. The edifice is 86ft. long from east to west, 62ft. wide across the transepts from north to south, 44ft. in width across the main body of the orchestra, and 21ft. 6in. across the orchestra, and 21ft. 6in. across the large vestry. There are also two other vestries. In addition to the large east window, there are thirty-four side windows, and eight oriel windows, which light the chapel by day. Sixteen pendants and twelve wall brackets, carrying incandescent gas burners, light the place by night. The front lobbies, staircases, landing, vestries, &c., are lighted by the same means. There is seating accommodation for 940 adults, or a mixed congregation of over 1000. The fittings are of pitch pine, varnished, and the glazing is of half-tint cathedral glass. The chapel is ventilated by means of thirty-four special inlets, and two large Boyle ventilators on the roof; while, in addition, there are eight oriel windows in the side gables. All the front entrance doors are made to swing both outwards and inwards. The chapel has been built by Messrs. J. H. Vickers and Son, Nottingham, at a cost of £5500, the architect being Mr. George Haslam, of Ilkeston.

LEEDS.—The Guardians of the Leeds Union are about to erect, at the Workhouse, Burmantofts, new imbecile wards, the foundation-stones of which have just been laid. The pavilion plan has been adopted—a building for males on the one side, another for females on the other side, and an administrative block between, the whole connected by covered corridors. Accommodation for over one hundred patients in all will be provided, and the arrangement will admit of an extension, should circumstances demand it, at a comparatively small additional cost. The administrative department will be of one story, comprising receiving and inspection wards for each sex, rooms for the medical officer, waiting-rooms, and padded-rooms. Adjoining the kitchen will be the dining hall. The male and female attendants will have separate mess rooms, adjoining the kitchen. The pavilions on the right and left will accommodate fourteen imbeciles and eleven epileptic patients of each sex on the ground floors, and thirty-four imbeciles of each sex on the first floors. Each pavilion will be provided with bath-rooms, &c. There will likewise be day rooms, these facing the south, and covered verandahs will afford shelter for the inmates who can make use of those retreats. Provision is made for a classification of the patients both in the wards and in the day rooms, there being a considerable number of single apartments. For the attendants there will be, on the second floors of the pavilions, comfortable bedrooms and sitting-rooms, with bath-rooms. The buildings will be substantial, but plain. About £14,000 is the estimated cost. The contractor for the excavation, the bricklayer's, mason's, and joiner's work is Mr. Wm. Airey, of Servia Road; for the slater's work, Mr. T. C. Heavyside, Roundhay Road; for the plumber's and glazier's work, Messrs. Braithwaite and Co., Swinegate; for the plasterer's work, Messrs. Wheeler Bros., Calverley; and for the painter's work, Messrs. Roylance and Horseman, St.

Mark's Road. The plans have been prepared by Mr. J. Mitchell Bottomley, Albion Street, under whose supervision the work will be carried out, with the assistance of Mr. Prentice, clerk of works.

LITTLE ILFORD.—The nave and aisles of the new church of St. Michael and All Angels, Little Ilford, have been consecrated. The church is in Romford Road, Manor Park. It is of red brick, with white stone dressings, and is surmounted by a spire. Only the nave and aisles have as yet been built. The cost of the work now completed is £4850. The interior walls are plastered, and the arched roof is supported by white stone pillars. The floor is of wood blocks, and the benches are painted dark green. The windows contain light-tinted cathedral glass, in lead sashes.

LIVERPOOL.—What is probably the quickest building feat yet accomplished in the United Kingdom took place recently. A large iron school to accommodate 600 children, under the auspices of the Liverpool School Board, situated at the North-end of the city, was taken down, removed to Wavertree, and re-erected, including the putting in of brick foundations, levelling and cinder of site, lighting, children's offices, heating by hot water pipes, water, gas, and drain connections (the latter to a depth of 30ft.), and enclosure of site with iron railings, in the remarkably short space of fourteen days. The work was carried out by Messrs. E. F. Blakeley and Co., Vauxhall Iron Works and Banastre Street.

LONDON, S.E.—The new baths and wash-houses, built by the Newington Vestry in Manor Place, Walworth Road, have been opened. The building has a frontage no less than 284ft. long, with a picturesquely broken outline. There is a tower with a clock and three dials. There are steep roofs, jutting windows, red brick walls contrasting with terra cotta columns, cornices, and other embellishments. Part of the building has two floors, but the central portion, surmounted by a turret, has three. The style is Renaissance, freely treated. Messrs. P'Anson and Sons are the architects, Messrs. Balaam Bros. the builders, and Messrs. Clarke and Sons the engineers.

MANCHESTER.—The Owens College buildings will receive in the course of the next eighteen months or so a very substantial addition by the erection of the new Whitworth Hall. The hall, standing at the intersection of Burlington Street and Oxford Street, will complete the College quadrangle, and will form a connecting link between the museum and the Christie Library. Messrs. A. Waterhouse and Son, architects, in preparing plans for the new edifice, have adopted a modification of the style employed by them in their design for the museum, the elevation plans being in perfect harmony with those of the museum, although there is no attempt at imitation. Constructed of Minera stone, the eastern side of the hall, fronting Oxford Street, will rise to a height of some 50ft. It will be pierced by a double row of apertures, of which the lower will be somewhat plain in character, more important treatment being reserved for the upper tier, which will consist of four large eusp-headed, transomed, two-light windows. This eastern frontage, agreeably broken by buttresses, will be further diversified by the principal public entrance to the building from Oxford Street, which will be developed into a very prominent feature, emphasis being given to it by two small pinnacled turrets rising to a considerable height, while strong detailed treatment will be bestowed on the gabling over the doorway, which will be crowned by graceful lancet-like windows. Immediately beyond this important feature will rise, at the south-eastern corner of the building, an imposing turret, which, with its fellow at the opposite angle, will flank the great traceried Perpendicular window in the south front. The roof will be remarkable for its high pitch, rendered necessary by the interior treatment. Along the entire length of the building will be the great hall, which will measure just over

120ft. by 50ft., its height up to the roof-plate being 35ft., and to the visible apex 56ft. 6in. This open-timbered roof will represent a modification of the hammer-beam treatment, and will be, of course, a very important feature in the interior design. Seats will be found for 977 persons. The total cost of the building may be roughly estimated at about £42,500.

NEW TOWN (Norfolk).—The new church of St. Paul's, at New Town, has just been dedicated. The building has a brick base, the walling above being of half-timbered construction, filled in with buck-nogging. The timbers show externally, and are of dark oak colour, and the buck-nogging between is finished with rough cast of a buff tint. The roofs are covered with red tiles, the windows have cinquefoil cusped heads and carvings, and are filled in with leaded cathedral glass. The bell turret at the west end is of oak, covered with oak shingles. The building comprises a nave 6ft. by 30ft., chancel 24ft. by 16ft. 6in., an organ chamber, and a roomy porch, with doors opening outwards. The church, when finished, will also have an additional porch, clergy and choir vestries, and a church room, 26ft. by 15ft. Internally, by an ingenious arrangement of pitchpine posts to the nave on either side and a special construction of the nave roof, the church can at a future time be considerably enlarged at a small cost. The nave roof is of open-timber construction, with carved principles, and the treatment of the chancel screen is in character therewith. The architects for the church are Messrs. Bottle and Olley; general contractor, Mr. W. Cork; plumbing, glazing, and painting by Mr. Rushmer, and gas fittings by Mr. Pank.

PERTH.—A new public hall for Craigie, Perth, has been opened. The plans were prepared by Mr. G. P. K. Young. The new building consists of a hall about 50ft. by 26ft., entered by a corridor, with ladies' and gentlemen's retiring rooms and a large committee room on the second floor. The hall has accommodation for 300. The front elevation is to be built of red stone ashlar work, and somewhat decorative in its details. The other elevation of the building will be very plain, and there are dwelling-houses on each side and gardens at the back. The roof is to be an open timber framing and plaster panels. The building is to be lighted principally by roof lights, while there will be three light windows in each gable. It is to be heated by means of hot water pipes, and ventilation will be received from an inlet passing overhead. The total cost of the hall will be £1435.

RADSTOCK.—The new Victoria Hall has just been opened. The building was designed by Mr. Wilcox, and is built of local white lias stone, with freestone dressings. The principal room, the lecture hall, is capable of holding 500 persons. There are also reading-room, refreshment and recreation rooms, library, offices, and caretaker's house. The work has been carried out by Mr. Joseph Bird, builder, Radstock, of a cost of £1100.

SPORLE.—The fine old Parish Church of St. Mary is closed for the purpose of undergoing a further and much needed restoration, the principal works undertaken being a new roof to nave and north chancel aisle in oak, taking off, recasting, and relaying the old lead, taking down and rebuilding the south nave arcading with clerestory over, both of which are in a dangerous state, and reinstatements of the ruined north chapel and sacristy. The cost, it is estimated, will not be less than £2000. Messrs. Cornish and Gaymer, builders, of North Walsham, are executing the work from designs supplied by Mr. H. Green, of Norwich.

WAKEFIELD.—Plans of proposed alterations at the Clayton Hospital, Wakefield, have been prepared by Mr. W. Watson, approved by the Hospital Committee, adopted by the City Council, and tenders are now being invited. The consulting rooms, which have long been inadequate, are to be enlarged, a new mortuary is to be erected, and a new laundry is to be built

Under Discussion.

CONTRACT CONDITIONS.

A conference between the architects and the Building Trades Federation has been held in the Masonic Hall, Forfar, to discuss the general conditions of contract recently issued by the Scottish Building Trades Federation. The conditions were discussed very fully, and compared with the new Dundee conditions and mode of measurement as agreed on between the architects and building trades of Dundee. The meeting seemed to favour the adoption of the Dundee rules, but left the final decision to a further meeting.

FEDERATION IN THE BUILDING TRADE.

A meeting has been held at Birmingham to consider the question of establishing a branch federation of employers in the building trade for the Midlands in connection with the National Association of Master Builders. Resolutions were passed that the Midland Branch of the National Federation should embrace the area covered by the following counties—viz., Warwick, Worcester, Stafford, Salop, Derby, Leicester, Northampton, Nottingham, Rutland, Lincoln, Huntingdon, and Cambridge. A representative committee was appointed to arrange the necessary details.

THE EDINBURGH ARCHITECTURAL ASSOCIATION.

The members of the Edinburgh Architectural Association recently visited the Museum of Science and Art by the kind permission of Sir R. Murdoch Smith. The Curator, Mr. D. J. Vallance, who conducted the party, gave a general description of the building, the dates and methods of its construction, the precautions taken against fire, the heating arrangements, and the workshops. Explanatory remarks were also given of the arrangement of the collections, and attention was drawn to the more important specimens.

THE INSTITUTE OF BRITISH DECORATORS.

A general meeting of the members of this Institute was held in the Painters' Hall, Little Trinity Lane, London, recently. The Secretary (Mr. W. B. Crawford, Glasgow) read a letter recently received from the Clerk to the Privy Council, intimating that their Lordships did not see their way to recommend Her Majesty to grant the charter applied for. —Mr. Bonnar (in the chair) stated that, while the refusal of the charter was to be regretted, it would not prevent the Institute from going on and overtaking practically all the objects aimed at, which no doubt would result in elevating their craft and making it attractive to capable young men of artistic tastes. Mr. Bonnar then vacated the chair, which was taken by Mr. J. D. Crace, as President-elect of the Institute when incorporated. —Mr. Crace, like Mr. Bonnar, regretted the result of the application to the Privy Council, but stated that the refusal might be the means of making them more zealous in showing the good which the Institute was bound to confer upon all those connected with their craft, and who had its best interests at heart. He further stated that, for administrative purposes, it was proposed to incorporate the Institute in terms of the special provisions of section 23 of "The Companies' Act, 1867," applicable to Art and Science associations. This course had been recommended by the Council of the Institute, and over one hundred members who were unable to be present had sent to the Secretary their approval of it in writing. —Mr. Thomas Bonnar (Edinburgh) then moved the following resolution, viz.: "That this general meeting of the members of the Institute hereby resolve to apply for its incorporation in terms of the provisions of Section 23 of The Companies' Act 1867." —The motion was seconded by Mr. J. C. M. Vaughan (Hereford), and on being put to the meeting was unanimously agreed to. —Mr. Charles Carlton (Glas-

gow) then moved: "That the persons named in Article 3 of the draft charter submitted to the Privy Council, with the addition of Messrs. William Allen and Thomas Preston, be deemed to be the promoters and managing body of the Institute in terms of the Board of Trade regulations, with power to add to their number; Mr. J. D. Crace to be president and convener." The motion was seconded by Mr. Henry Gibson (Dublin), and unanimously agreed to. —The third resolution was moved by Mr. Mawer M. Cowtan (London), and was in the following terms, viz.: "That the persons afternamed be appointed a committee to take all necessary steps for the incorporation as aforesaid, viz.: Messrs. J. D. Crace and M. M. Cowtan (London), Mr. A. G. Whyte (Liverpool), Mr. J. C. M. Vaughan (Hereford), Mr. Thomas Preston (Burnley), Mr. Thomas Bonnar (Edinburgh), Mr. R. J. Bennett (Glasgow), Mr. Henry Gibson (Dublin), and Mr. J. Sibthorpe (Dublin); Mr. Crace, convener." The motion was seconded by Mr. Maurice E. Dockrell (Dublin), and unanimously adopted. —Mr. Vaughan moved: "That in view of the early incorporation of the Institute, the committee beforenamed be empowered to make such provisional arrangements as they may think expedient for placing the Institute on an active basis as soon as incorporated, and to report." —The motion was seconded by Mr. W. G. Sutherland (Manchester), and unanimously adopted. —The labours of the Secretary were cordially acknowledged in a vote of thanks at the close of the meeting.

"ARCHITECTURE v. BUILDING."

Lecturing on this subject at the Carpenters' Hall recently, Professor Banister Fletcher pointed out that the great end of Art was pleasure, and then proceeded to describe the affinity of Art and Architecture. To show how practical was the work of the architect, he gave some drawings of buttresses, indicating first the ordinary "shore" of the builder, and secondly the same end accomplished by the architect's more pleasing buttress and flying buttresses. The point the speaker emphasised was that no ornamentation of Architecture could be good which structurally was bad, and this he illustrated by a specimen of an exceedingly ugly decorated French buttress. Passing on to the necessity of the study of proportion as an essential characteristic of Architecture, the professor gave some useful rules which might be generally applied in the construction of ordinary houses, dealing more especially with the proportions of windows, doors, and staircases. Many excellent views were shown, some of them of the most admired architectural types known to the world; and, as a concluding remark, the lecturer pointed out that nothing was beautiful in a design unless it was meant to serve some good end.

COST OF GAS AND ELECTRICITY.

At a recent meeting of the Royal Scottish Society of Arts at Glasgow, Mr. Andrew Beatson Bell, president, in the chair, Mr. G. K. Grieve read a paper on "The comparative cost of gas and electricity as sources of light, heat, and power." For the purposes of the lecture the hall was fitted up with incandescent gas lamps, and an inquiry into the cost of the two illuminants showed that lighting by electricity cost four times as much as lighting by these lamps. He came to the conclusion that heating by gas, as compared with heating by coal, was, at present prices, two and a half times more. He found it impossible to estimate the cost, from actual results, of heating apartments by electricity. In America it was found that heating cars by electricity was about five times the cost of heating by coal. He had himself experimented with heating water by gas, and he found that the cost which was given out by heating water by electricity was twelve times more. As to the relative costs for motive power, the cost for electricity in Edinburgh would be three times that for gas. Although it was evident that there were difficulties to be overcome, electric traction appeared to be coming.

Enquiry Department.

TO BUILD A VILLA.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would any of your correspondents forward me a working plan of a villa with bay windows for the bottom front rooms, with the front entrance between the windows? The house to be of yellow brick, and the windows red. The size of the rooms: Dining-room, 14ft. by 12ft.; drawing-room, 12ft. by 12ft.; sitting-room, 12ft. by 10ft., and kitchen, 10ft. square. Bedrooms to correspond, and a small outhouse. Whether the above described house could be constructed for £150 to £200, including labour, but not the ground, and, if so, what quantity of bricks, wood, slating, or tiles, with mortar, would be necessary for the purpose? If these questions could be answered by any of your correspondents, I shall be pleased to hear from them.—I am, Sir, Yours obediently,

I. C. B.

R. E. EXAMINATION.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I intend reading the necessary course for an assistantship of the R.E., and, as there is a paper on sanitary engineering in this examination, I shall be glad if you will let me know if Baldwin Latham's "Sanitary Engineering," second edition, 1878, is modern enough for this purpose. Also if the four volumes of Rivington's "Building Construction" would be sufficient. I hope you will pardon my presumption, but away in the North of Ireland here there is no technical school or college where such information is imparted, consequently we have to "jog along" just as best we can. I may add that I get a great deal of information from your paper, and latterly from your newly-opened supplement. Would it be too much trouble to ask your opinion about the stiffness of this examination? I would be very grateful for your opinion.—Yours truly,

"HANDICAPPED."

Baldwin Latham's "Sanitary Engineering" is an excellent book, which has not been superseded, but you had better supplement your reading of the chapters dealing with the subject of house drainage and w.c.'s with "The Plumber and Sanitary Houses," by S. Stevens Hellyer (1893); and also with Mr. Saul's articles which have recently appeared in our own columns. The four volumes of Rivington's ought to be sufficient for Building Construction. We cannot offer any opinion as to the stiffness of the examination. Could you not obtain copies of the papers set at previous examinations, and judge for yourself?

At New Wortley a new Methodist chapel has been opened.

A STAINED-GLASS window has been placed in Corstorphine Church.

THE schools of Christ Church, Southport, have been rebuilt, and will accommodate 600 children.

SIR WILLIAM CUNLIFFE BROOKES has contributed £2000 towards the building fund of the new west front and Victoria porch of Manchester Cathedral.

AN inquiry has been held at Conway respecting an application by the Town Council for permission to borrow £1500 for new municipal buildings, and £310 for gasworks purposes.

AN inspector of the Local Government Board has held an inquiry at Manchester into the application of the Corporation for a provisional order to empower them to put in force the Lands Clauses Acts, for the purpose of making a new street from the junction of Long Millgate and Ashley Lane to Charter Street, and for the widening and improvement of Hanging Ditch. In the second place, the sanction of the Board was desired for the borrowing of a sum of £16,000 for purposes of electric lighting; and, by a third application, sanction was sought to borrow £10,000 for the provision of sanitary conveniences.

Trade and Craft.

THE TUBULAR BATH BOILER CO. LIMITED.

Nowadays hot-water apparatus forms quite an important subject of consideration in house building. At one time the liability of boiler explosions was ever present, but the Patent Tubular Bath Boiler, made by the Tubular Bath Boiler Co. Limited, of 184, Gray's Inn Road, is described as being perfectly safe, whilst it is also said to economise fuel to the extent of 50 per cent. Instead of being placed at the back of the kitchen fire, the Patent Tubular Boiler really takes the place of the fire-tile next to the oven or ovens, but does not take away the heat, as the flames pass over and between the tubes on to the oven and hot plate. The water circulates through the tubular boiler, passing in from the hot water tank and back again through the boiler. All sediment drops into a channel at the end of the boiler. An important feature of the invention is that its construction abolishes the nuisance of having to frequently clean it out, as is necessary with the old high pressure kind. From the position of the tubular boiler in the kitchen, hot water is obtained soon after the fire has been lit, for the water begins to circulate immediately. It should be noted that it does not boil in the pipes, thus obviating the dangers of incrustation. The Patent Tubular Bath Boiler can be fitted to any size kitchen.

KEY'S METHOD OF VENTILATION.

Recently the Edinburgh Architectural Association, together with the members of the Leith School Board, paid a visit of inspection to the new buildings of the Leith Academy, which is fitted up for technical instruction and to accommodate 2000 pupils. The method of ventilation and warming received special attention, this being the first installation in the vicinity. During the visit 3,700,000 cubic feet of air was being propelled through the building every hour; the winter volume being 3,300,000 cubic feet per hour, while in summer 4,300,000 cubic feet of air per hour will pass through the class-rooms without draughts. The appliances consist of air filtering screen, kept moist by water trickling over it, with the provision of outer coils of tubes, steam heated, to prevent same from freezing in the winter. The air is drawn through the screen, then through a large chamber filled with steam heated tubes. The propeller draws the air towards it, and afterwards propels it into the main air ducts, from which it is led in vertical flues to each room separately, there being a separate coil for auxiliary air passing at base of every flue, so that any room can be warmed to a different temperature than the others. The boiler house contains a large Lancashire steam boiler, and steam heated copper heater for warming water for floor washing and lavatories. In the "steam engine" room a high-class steam engine is provided for driving the air propeller in winter while the steam warming is required, and also the automatic steam boiler feed pump which returns all water of condensation back to the boiler automatically, thus saving the water and requiring very little to be added to boiler to make up for loss. The gas engine room has a high-class steam engine, connected to "Key's" silent exhaust boxes, whereby no noise from explosive discharge is heard either in the engine room or outside of the building. The party, having inspected all the rooms, met in the lecture theatre, and called on the inventor of the method of improved Plenum ventilation to describe it. Mr. W. Key, who is the designer of all the appliances and the methods of ventilation and warming, as well as the contractor for this work in the building, gave a description of the methods of ventilation in the past with statistics of the results therefrom, afterwards showing by diagrams on the blackboard results of his improved methods, whereby the impurities of micro-organisms present in the air of schools is reduced from an arbitrary figure of 85, for the old artificial

methods, and mechanical ventilation by extraction of 95, to the figure of 5 by his improved Plenum method. Mr. George Craig, Leith, is architect for the Academy. The Gothen School at Glasgow is another new building wherein Key's method of ventilation has been adopted. It is the first school in the county fitted with the latest improvements in the application of scientific methods of ventilation and warming. Although the air was being changed nine times per hour in all the class rooms, the temperature, during the temporary absence of the attendants, had reached to 65deg. Fahr., and, being too warm, requests were sent from those present at the opening ceremony to the engineer to reduce it, and in a very short time the temperature was lowered to 57deg. Fahr. The school is erected to contain 850 pupils. The volume of air passing through the rooms during the opening ceremony was 1,700,000 cubic feet of air per hour, 2,100,000 being the volume for summer warm weather, and in winter, when the heating apparatus is in use, 1,500,000 cubic feet of warmed and washed air will be propelled into it every hour. The plans of the building were prepared by Mr. Henry Higgins, Jun., architect, Glasgow.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

AUDENSHAW.—For laying an intercepting sewer from Station-road to a point between Ashton Hill-lane and the Canal, for the District Council. Mr. J. H. Burton, surveyor, 2, Guide-lane, Hooley Hill:—
J. Smith ... £880 15 0 | T. Cooper ... £594 0 0
R. Dingley ... 830 0 0 | W. Hurst, Droydsden* ... 592 6 3
J. Chalmers ... 694 0 0 | J. T. Rowlands ... 590 0 0
J. J. Blackburn ... 691 0 0 | Matthews and Co. ... 580 10 0
Underwood Bros. ... 657 0 0 | R. C. Fish ... 572 10 0
Sharples & Moore ... 655 15 0 | E. Cheetham ... 572 0 0
W. J. Wilkinson ... 630 10 0 | W. J. Froom ... 566 0 0
Worthington and ... 627 5 0 | J. Farrell ... 550 19 6
Powall ... 615 10 0 | * Accepted.
H. Davison (Surveyor's estimate, £698 9s. 6d.)

ASHFORD.—Middlesex.—For erecting house for Mr. Chas. Sale. Mr. H. W. Smith, architect, 19, Tremlett-grove, Junction-road:—
Collinson ... £895 | Robinson and Francis ... £745
Brown ... 847 | Trust ... 730
Speechey and Smith ... 769

BALLYNAFEIGH (Ireland).—Accepted for the erection of Methodist church, for trustees of same. Messrs. Forman and Aston, architects and civil engineers, Queen's Buildings, Royal-avenue, Belfast:—
Young and Dickson, Pakenham-street, Belfast £2,663

BANGOR (Wales).—For the erection of Friars School, for the Governors. Messrs. Douglas and Minshall, architects, 6, Abbey-square, Chester:—
E. Williams ... £11,435 11 0 | R. J. Williams ... £10,065 15 11
Jones & Williams ... 10,718 15 0 | E. Jones ... 10,038 19 0
W. Jones ... 10,547 0 0 | G. Woods & Son ... 9,800 0 0
W. Parry ... 10,394 0 0 | J. Mayers ... 9,500 0 0
T. Browne ... 10,160 8 6 | J. Hamilton & Son ... 8,803 0 0
S. Parry & Sons ... 10,154 0 0 | Altrincham* ... 8,803 0 0
* Accepted with modifications.

BEXHILL.—For erecting a new scholastic residence, Bexhill-on-Sea, for the Rev. F. Burrows, Ancaster House, St. Leonard's-on-Sea. Messrs. Jeffrey and Skiller, architects, Hastings:—
M. Martin ... £4,650 | Padgham and Hutchinson ... £4,280
Eldridge and Crutten-den ... 4,436 | J. Simmons and Co. ... 4,232
J. Lester ... 4,397 | A. H. White, St. Leonard's* ... 4,186
H. E. Crutten-den ... 4,368 | * Amended and accepted.
P. Jenkins ... 4,300

BOSTON (Lincolnshire).—For the erection of offices, wine, spirit, and beer stores, stables, shed, cottages, &c., for Messrs. Souby, Sons, and Winch. Mr. Jas. Rowell, architect, Boston, Lincolnshire:—
S. Sherwin ... £2,487 | Chas. Jessop ... £2,040
Wadley and Co. ... 2,486 | John Lucas, Boston* ... 1,970
H. W. Parker ... 2,193 | * Accepted.
[Architect's estimate, £2,400.]

BOURNEMOUTH.—For the erection of a new residence, for the Misses Swaisland, at Southbourne-on-Sea. Mr. G. A. Bligh Livesay, architect. Quantities by Messrs. Jennings and Goater:—
W. Hoare ... £2,336 | Jenkins and Sons ... £2,210
George and Harding ... 2,320 | Jones and Sons ... 2,198
F. Hoare and Sons ... 2,297 | McWilliam and Son* ... 2,178
* Accepted, subject to modifications.

BROADSTAIRS (Kent).—For the execution of sewerage works, for the Urban District Council. Messrs. Law and Son, engineers, 17, Victoria-street, Westminster, S.W.:—
Pedretti & Co. ... £23,711 13 7 | B. Cooke & Co. ... £18,324 0 0
W. H. Saunders ... 19,244 0 0 | A. Kellett ... 16,600 0 0
and Co. ... 16,573 0 0 | G. Bell ... 16,573 0 0

BUCKNALL.—For pumping station buildings, &c., for Stoke Rural District Council. Lamer Souden, F.R.I.B.A. (surveyor to the Council), Miles Bank-chambers, Hanley, architect. Quantities by the architect:—
Jesse Cope ... £2,009 18 10 | Moss and Son ... £1,527 0 0
Walley & Woolis-croft ... 1,800 0 0 | Sampson Salt ... 1,406 10 0
G. A. Foster ... 1,744 0 0 | T. Godwin ... 1,413 19 6
T. Goodwin ... 1,560 0 0 | James Moss ... 1,366 0 0
C. Cornes ... 1,550 0 0 | J. Bagnall* ... 1,275 14 2
* Accepted.

CHURCH ASTON (Salop).—For the execution of water supply works, for the Newport Rural District Council. Mr. W. Wyatt, engineer, Bryndwr, All Saints, Shrewsbury:—
For Pipes.
D. Parsons and Sons, Pensnett, Dudley* ... 4in. ... £4 18 9
... 3in. ... 5 0 0
... 2in. ... 5 2 9
For Laying.
A. & W. Massey, Newport, Salop* ... 4in. ... £0 1 4
... 3in. ... 0 1 2
... 2in. ... 0 1 1
* Accepted.

CORBRIDGE-ON-TYNE.—For additions, &c., to Sandhoe House, for Colonel Hornby. Messrs. Potts and Son, architects, 57, John-street, Sunderland. Quantities by the architects:—
Middlemiss Bros. ... £1,938 6 0 | W. Smith ... £1,331 7 1
Kirk and Brown ... 1,750 0 0 | E. Snowball ... 1,228 0 0
R. Hudson and Sons ... 1,625 0 0 | J. Civil ... 1,225 19 6
J. B. Stott ... 1,610 14 0 | Ehas Dasington, Hisham* ... 1,223 0 0
G. H. Robson ... 1,501 11 10 | * Accepted.

CROYDON.—For pulling down and rebuilding Nos. 20, 21, 22, 23, Surrey-street, Croydon, for Mr. J. Mann Taylor. Mr. J. William Stevens, architect, 21, New Bridge-street, City, E.C. Quantities supplied:—
White and Co. ... £4,830 0 0 | A. Bullock ... £3,974 0 0
Lorden and Son ... 4,444 0 0 | Saunders ... 3,909 6 0
Potter ... 4,377 2 11 | Bryan and Son ... 3,895 0 0
Whitehead & Co. ... 4,325 0 0 | E. P. Bulled and Co. ... 3,879 0 0
W. Smith & Son ... 3,990 0 0 | Co. ... 3,700 0 0
D. W. Barker ... 3,989 0 0 | S. Page ... 3,700 0 0
S. Hart ... 3,987 0 0

DARTFORD.—For workhouse extensions, West Hill, for the Union Guardians. Mr. G. H. Tait, C.E., Lowfield-street, Dartford. Quantities by Mr. A. R. Brede, Gray's-in-road:—
Gunning ... £21,200 | Knight, Sidcup* ... £18,243
Thomas and Edge ... 18,243 | * Accepted.

DEVONPORT.—For alterations to 12, William-street, for Mr. A. Waterfield. Mr. Edgar M. Leest, architect, 109, Fore-street, Devonport:—
A. N. Coles ... £215 0 | R. C. Parkhouse ... £178 0
T. Jenkin and Son ... 178 10 | W. E. Blake, Plymouth* ... 153 0
G. Turpin ... 180 0 | mouth* ... 153 0
* Provisionally accepted.

EDMONTON.—For new offices and board-room, for the Edmonton Board of Guardians. Mr. T. E. Knightley, architect:—
C. Wall ... £6,317 | Fairhead and Sons ... £5,985
Knight and Son ... 6,275 | Thomas and Edge ... 5,904
W. Lawrence ... 6,235 | P. Hart ... 5,912

GRAVESEND.—For additions and alterations on the "Clarendon Royal Hotel," for Mr. R. L. Cosh. Mr. D. Carmichael, architect, London. Quantities supplied:—
Milton and Wallis ... £1,135 | H. W. Martin, Gravesend* ... £1,023
Tuflee ... 1,690 | end (accepted) ... 1,023
* Accepted.

S. Ransom and Co., Kensal-road, London* ... £271 10
* Accepted.

Case for the Despotic Grocermen.

"JUSTICE," as personified by a late correspondent to the BUILDERS' JOURNAL, has cried aloud against the common usages and conduct of Public Competitions. One has heard that voice before, crying in the wilderness of an universal apathy; but, in general, the lamentations of architects in competition smack of childishness; and, though the milk of one's human kindness is ready to flow forth in

The conduct of a public (or limited) competition is clearly a matter of contract, and it is the business of the parties to see that their interests are fully represented and properly protected in the terminology. It is the business of each who enters into agreement to secure the most advantages upon the most issues, and there is no rule of law or morality which puts any obligation upon a man to pay more for a thing than the vendor asks, or to refrain from exacting the full forfeit from one who has entered with open eyes upon a tussle for the best of a bargain. If a man is incompetent to guard his own interests in the world-wide game of grab, in which he has voluntarily elected to take hand, speedy disaster is his right and just reward; and none dare say that those who gain by his loss carry any infamous imputation. If there shall have been infringement of right, redress does not lie in crying aloud upon humanity to witness, and combine morally to denounce the wrong, but in an action at the High Court of Judicature. There can be no moral obligations in a transaction wherein none are admitted, and, as bearing on affairs, it is well to remember that whenever a position is

of any explicit promises to falsify. The conditions are so hedged with saving clauses that in many cases the committee are really bound in nothing but the mere payment of premiums, and in some cases even this is subject to the designs being approved. There are actually hardly any cases at all—not one per cent. probably—of conditions of competition stating or implying that the award of the assessor is to be absolute. The assessor is employed to "advise" or "assist." When the assessor's award is promised to be held decisive, the undertaking is usually conditional upon the work being executed, or upon any design accepted at all. Again, the number of competitions in which the conditions contain a promise that the winner of the first award shall be commissioned to carry out the work is probably under five per cent. A clause exempting the committee from "accepting the first award," or even "accepting the first or any award," is the most consistent and unvarying clause found in conditions of competition. Now, whenever an assessor's award is set aside, and whenever the winner of the first award is supplanted, as architect of the work, by

Old Cottages
Sandford Devon.

CREDITON AND ITS DISTRICT.

commiseration of the ingenuous competing soul, tricked and defrauded by conspiracy of Town Council, yet the utter fatuity of architects engaged in these enterprises not unusually provokes one to no more than a wry mouth. The framing and enactment of competitions is purely a business transaction. Upon no other ground is their existence intelligible. There can be no thought of any charitable or philanthropic motive anywhere; and a scheme for mutual benefit cannot exist as such, when each party would be at the other's throat. The "Conditions of Competition" as now drawn up may be very fairly described as a sham legal instrument; it is a sham form of contract, wherein the obligations of the competitors are clearly and exactly defined, and the obligations of the promoters set in such loose and ambiguous terms as renders them open to any interpretation that subsequent events may show to be most profitable to the promoters.

accorded to moral obligations, the way of the world at once secures an immoral usage stretching from horizon to horizon. Young architects who cannot find opportunities to satisfy their ambition, in the slow rising of real worth swarm to compete, and invite failure and disaster on the distant chance of bettering their fortunes. They solicit calamity on the chance of a pittance, and their protests and complaints when they duly find themselves a-sprawl are hardly worthy of very serious attention. There is certainly some cause for these wide-flung appeals when, as occasionally happens, an assessing committee goes back on its explicit promise; although the competitors should have properly assured their position, so that such backsliding had been impossible. The truth is, however, that it is very rarely that a committee does actually falsify an explicit promise. This is not for any qualms of conscience or sentiment, but for sheer lack

some outsider, there are protests loud and long. And yet the conditions expressly state and imply that such usage is to be expected! The whole matter, however grotesque, is truly quite deplorable; but whether the assessing committee break their precise and implied undertakings, or merely avail themselves of the subtle ambiguities and saving clauses of their Conditions, the ever recurrent protests and denunciations of competing architects must seem utterly senseless and puerile to all business men, and to all ordinary sensible people who are not biased with the peculiar artificial and sentimental point of view with which the Profession regards competitions alone of all other business transactions. For oneself, one hopes to live to see the great historic stand of British Architects against the tyranny of British Grocermen an accomplished fact.

B. C.

THE WESTMINSTER IMPROVEMENT SCHEME.

By ERNEST RADFORD.

(Continued from page 156.)

EITHER criticism or the apprehension of criticism has effected modifications in the schemer's original plan. Mr. Norman Shaw has written to say that the neighbourhood of Smith Square, including Great College Street Barton and Cowley Street, is not threatened, and, further, that the width of the continuation will be 130ft. instead of being narrowed to 40ft., as it appeared it would be. It would have been absurd to describe a road diminished to this extent as extended, for it would not in fact have been the same road at all; and as it was certain that this niggardly plan for a "miserable road" would have been stoutly opposed if submitted, the petitioners have announced their intention of providing a better. So far so good, we may say; but a plan cannot be altered in part without the whole being affected, and it remains to be seen what further amendments will be required. If an Avenue 90ft. wide is to replace Abingdon Street and Millbank Street, and if in deference to public opinion the petitioners decide to extend the Embankment in the manner above described, there will then be two carriage ways within a few yards of each other, and tending to meet at the end of the Horseferry Road, which is absurd, as Euclid would say, and is made even more so by the fact that the plan would involve a cross-road connecting the two. [Not even a coach and four can drive through the Houses of Parliament, and, clearly, to regain the Embankment after deflecting at Westminster Bridge the driver would have to turn to the left out of Abingdon Street.] If three such roads should be made where really not one is required, then the eligible building site would be greatly reduced, and the possibilities of profit to the Company would be diminished accordingly. Not only the land but the speculative builder would be "cut up" most awfully, and it is thought that Mr. Warren's proposal, being better by far than the other, is more likely to be accepted. Now with regard to the Avenue (Street No. 1 in the plan) which will replace Abingdon and Millbank Streets. The latter, Mr. Warren admits, is "narrow, winding, and inconvenient, so indefensible, in fact, as a thoroughfare that the County Council has already a plan for widening it." But, bad as it is, "it has one merit at least, that of approximately right

direction." The concluding words of this sentence should not escape the writer, for they are, indeed, suggestive of thought. If the Thames had been confined by Nature within exactly parallel lines then London might all have been T-squared and planned like a brand new American city; but, fortunately, it is not so, and abstract ideas of uninterrupted vistas can seldom be realised here. There may be some truth in the saying that the line of beauty is curved, but for myself I incline to say that it is better described as "Love's Enclosure," and that it may be reallinear, curvilinear, or altogether irregular. There is beauty in Hobsen's Avenue, and beauty down here by the river where we follow a winding road. "If this new street is produced southward, and kept perfectly straight, it terminates against the steps of the Tate Gallery, after showing in the most ungainly fashion the backs of the modern houses in Grosvenor Road." From beginning to end it will be little more than a back lane, wider than need be, and yet altogether too narrow to have the dignity implied by its name. "It is shown as a boulevard planted with trees, and has been eulogised by some unthinking but friendly critics as a splendid avenue." The apparent width of a street is obviously related to the height of the buildings through which it passes, and it cannot be supposed that a speculating company would, in the matter of height, stop short of the extreme limit allowed by the London Building Act. Its trees are not likely to flourish. It will carefully avoid all river view, for that is to be reserved for the happy dwellers in the big blocks which faces the delightful prospect of Lambeth." Mr. Warren continues: "At the northern end of this particular avenue it will be seen that it is the intention of the syndicate to acquire and remove the terrace of quiet Georgian houses known as Abingdon Street," and the "removal will include, apparently, the fine old house now occupied by the Board of Trade, whose admirable stone front faces Old Palace Yard. A site will thus be obtained which for nearly its whole length will have the fine view eastward of the river across the Tower gardens, and westward the really delightful prospect of the Abbey gardens, the Abbey itself, and Westminster School." To whom, then, shall the site be surrendered? If to the people of London, a handsome and dignified block of public offices will replace it, and will be worthy in every respect of its position. If to the speculative builder, "a ten-storied pile of flats in red brick, or a giant hotel." The temptation is great to quote much from this article, as the writer

has left us but little to say, and it would be difficult for anyone sharing his views to present the matter more forcibly. "What the syndicate offers is at best but a sorry bargain. We are to grant to a private body of commercial speculators, for its own behoof and benefit, powers to smash, obliterate, and wreck, on a gigantic scale, an ancient and interesting quarter of the historic city of Westminster; power to convert to its own commercial ends sites of national value (which we may one day have to redeem at immense cost); and last, but not least, powers to create another great proprietary estate—an oligarchy of ground landlords." The counter-proposal is moderate in the extreme if compared with that of the wrecker, for we would save nearly all that is threatened. The road that Nature has made by the River, let it be beautified from end to end, and let its houses command the view so often as it may be possible. When opportunities of purchase occur let London assert her rights. It appears that Mr. Warren's modest indication of a possible scheme, in so far as it refers to the new-found-land to the south of the Tower Gardens, requires hardly any modification. The "Avenue" scheme will be squashed, but what of the promised Embankment extension? Let us imagine ourselves more opulent than we actually are, and possessed of a carriage and pair. Let us enter the same from the Temple, perhaps after service on Sunday, with the spell of slow music upon us. It were needless to describe the drive, as the route is all too familiar. But suppose the sun to be shining for once, and Westminster looming above us. Will it detract from our pleasure to find that the road deflects at the Bridge, sweeping proudly around the great buildings, and embracing all as it goes? We are now where the reader should be—in the Old Palace Yard, to wit; and, instead of disporting ourselves as we would, are spoiling the Day of Rest by halting, not to enjoy, but merely to talk more excitedly than is our wont about the terms of a Bill, which promises to spoil as much as meets the eye at this point. In the map which accompanies this the available plot is shadowed, and we would have it decided at once whether it shall be made public or not? The plan of the proposed new garden need not be discussed at present, but it is thought that if it were open, a flowered walk by the riverside would be enough for all popular purposes. The houses of Millbank Street would command it, looking over it on to the river; and it goes without saying that a street so distinguished would be very well cared for, and would in its way become beautiful. If the idea of treating the public to land which might be let to advantage is thought too extravagant, we can only suggest as an alternative that residential chambers, including club comforts and chapels, should be erected for the happily unmarried members of Parliament. The terrace at least would be common to them and their constituents, for this at least should be ours. The idea is delightful, but, like Mr. Tristram Warren's, is merely suggested. There will doubtless, he says, "be many and better ones. What is, however, imperative is that the plan should be laid on broad Imperial lines, and not dictated by the cramped necessities of a speculative venture."

PLAN SHOWING AREA AFFECTED BY THE WESTMINSTER IMPROVEMENT SCHEME.

A STABLE and workshops in Belvedere Road and Chicheley Street, Lambeth, are about to be rebuilt for Mr. B. T. Chamberlain, according to the designs of Mr. Robert Willey, 33, New Bridge Street.

THE Plymouth Town Council has adopted a report of the Works Committee for the reconstruction of the defective subsidiary sewers in district No. 3, in the southern part of the borough comprised within the boundaries of Jubilee Street, Higher Street, Treville Street, and Palace Street on the north, St. Andrew's Street and Hoe Street on the west, and the Hoe and Sutton Harbour on the south and east, and also for the repaving of certain streets within the same district, the estimated cost of the sewerage works being £13,693, and of the paving works £24,185.

CREDITON AND ITS DISTRICT.

By G. J. F. HOOKWAY AND A. L. COX.

(Continued from page 160.)

THE town can boast of very little outside the precincts of the church, but in the main street—viz., High Street—there is a fine specimen of a Georgian house, with a quaint bell turret of the same period. The old almshouses in Church Road are very picturesque, and are fine specimens of old Devonshire cottages. With their large chimneys set anglewise, and the roof covered with thatch, they present a pleasing appearance. A sketch of these is given. About half a mile from the church is the old town green, though there is little of the green at present growing. In the centre is the stump and base of old town cross. (See sketch.) A few years since bull baiting was prevalent, and one of the chief sports of the neighbourhood. The sports took place on the green, the bull being chained to the cross, the shaft of which was broken, eventually leaving it as we see it now. The green on gala days was a picturesque sight, old English sports being indulged in freely. It is now used chiefly by the small fry of the place. It has been proposed to replant the green as part of the Jubilee celebration.

Not far from the green is situated, in the midst of a garden, the desecrated chapel of St. Lawrence's Hospital. It was dedicated to St. Gregory, and is a rectangular structure. The internal measurements are 45ft. by 18ft., with finely proportioned angle buttresses. Triplet windows of equal height occupy the east and west gables, whilst on the north side are traces of a door. The windows are both blocked with masonry. The chapel is a good specimen of the Lancet period, and dates from 1206. It formed one of the eleven chapels that were in the neighbourhood belonging to the Collegiate Church, and of which portions only some three or four remain; some have been demolished within recent years. St. Lawrence's Chapel has now been turned into cottages, and many things added to give it a domestic appearance. Strange to say, that, with the exception of these chapels, nothing whatever is left of the collegiate buildings, which were considerable; but the

memory lingers in the name of Dean Street, and a modern house in the parish is called as the "Palace." This may mark the site of the bishop's residence.

There are two ancient wells in the parish, one being marked by a stately poplar tree, and called Winifred's Well. This is an error, the true name being Winfrith, or Boniface, who was born here, as has been stated in the early part of this article.

There is a field here known as "Lord's Meadow," where, in 1644, Charles I., with his son Prince Charles, reviewed the Royalist army under Prince Maurice; and in the same place, a year afterwards, Fairfax drew up his troops, Oliver Cromwell being present. To come down to our own times, George Edmund Street, the architect, lived here we believe on two occasions, and doubtless the frequent visits he paid the fine old church, then in a different state than now—coupled with journeys to her more beautiful sister and neighbour, Exeter Cathedral—did at least something to form his lofty mind and give cunning to his hand.

In the latter part of the eighteenth century the town was nearly destroyed by fire, and consequently, much ancient work must have perished, for there is little at present remaining apart from what has been mentioned. A workman, whilst doing some repairs to the church last year, found about 1848 coins in an old buckskin bag. The coins dated from Edward VI. to Charles I. After a lengthy controversy and an inquest, the coins were sold by auction, fetching about £90. The coin that realised the highest price was a half-crown of Charles I., in poor condition. The money realised by the sale was handed over to the Church Governors, the finder receiving £5 (!) as a reward.

The town was far famed for its wool spinning and manufactures of cloth in ancient times, but the trade has long since departed. The vale of the little river Creedy is extremely picturesque, and in summer, resplendent with the wild flowers of the season, many excellent views of the surrounding country may be obtained from the adjacent hills that overshadow the valley. There are several fine seats in the neighbourhood, that of Sir Redvers Buller and also Sir John Shelly's being the finest, the latter, known as Shoebrook Park, having a fine collection of paintings,

amongst them being works from the brush of Eastlake, Wilkie, Webster, Lee, &c.

A recent gale destroyed no less than 1000 trees in these fine parks; in the short space of an hour stately elms that have defied the storms of centuries and smiled at the frown of Orion the herald of the hurricane and gale, lay one after another conquered and fallen.

From the Cridiantune of the Saxon to the Crediton of to-day is a long stride and countless have been the changes effected. The hand of time, the ravages of fire, the storm-cloud and man's handiwork all have had their share in the obliteration of old time structures. As we view from the top of the adjacent hills the busy little town below, we hark back to the days when Winfrith planned and built his little church, and gathered his Saxon flock around him listening to the truths which he had been taught and learnt in St. Peter's Monastery at Exeter, and then when Danish marauders inundated the country, pillaging the villages, bishops one after the other doing their noble work, till the time came for the ninth and last to put aside crozier and mitre. Open to attacks and undefended the far-seeing Leofric with the fact before him translated his see eight miles away, where at least the Mother Church could be screened from the enemy's attack behind the city walls. But after the loss of her bishop and the disappointment at the removal of the see, there arose on the little knoll rising beneath us the finest collegiate church in the county. The slow but sure process of decay eventually caused the fine old church to become a ruin, and the timely aid of the bishop came not too soon, for under the skilful laws of the fifteenth century builders we have the Crediton Church as we see it now.

We leave the town with lingering footsteps, feeling that we have learnt something from the hand of long departed craftsmen.

Having dealt with Crediton and its fine old church, we now turn to the district, which is full of interest to all lovers of Architecture and antiquity, and whether it be an incised stone, a village cross, or an ivy-clad tower, each has something to tell of the times, customs, and manners of those whose trowel or chisel wrought their forms. As we mount up the hilly Devonshire roads and wooded lanes, there can be seen many towers standing like sentinels against the sky, or rising above

Base of old Cross Creditor Green

clumps of stately elms that cast their shadows on the old-time structures, and, as it were, protecting them from the storm.

Wending our way in a south-westerly direction from Creditor, we enter the village of Newton St. Cyres, about $3\frac{1}{2}$ miles distant from Creditor. It is a typical Devonshire village, the little cottages being built entirely of cob and roofed with thatch, quaintly gabled, with huge chimney breast rising well above the eaves line, the red brick chimneys with tiny gablets behind, roofing over the breasts that come to the level of the roof plate, all lending that charm and beauty only to be found far from crowded cities. Throughout the entire place only some three or four slate roofs are to be found and one cannot but notice how cold and severe they look beside the warm and picturesque thatch covering of those near and around them. Ascending the steps leading to the churchyard, we come at once upon a structure that has escaped to some extent the hand of the "restorer." The building is a good example of Devonshire Early Perpendicular work and consists of chancel, nave with north aisle, and western tower—it is dedicated to St. Cyr or Cyres the infant martyr, killed with his mother Julitta A.D. 304. The north aisle contains a fine monument to the memory of James Northcote, which consists of a full length figure standing under a canopy and habited in the costume of the 17th century, his right hand holds a staff whilst his left rests on the hilt of his sword. On either side of the figure are medallions of his two wives Elizabeth and Luzanna, whilst underneath are the figures of his son and wife and their three children all kneeling and in the act of devotion. The tomb is richly coloured, but undated, it probably dates about 1650-80.

Of the other memorials in the church there are none of exceptional interest, and most relate to the members of the Quicke family, who have occupied Newton House since the days of Elizabeth. There is little else of interest in the church; the north aisle, added at a later date, is more richly treated externally; the buttresses are all niched, and the original figures are much worn by the hand of Time; the parapet is pinnacled and broken. The face of the wall is relieved at intervals between the buttresses by holes about 4 ins. square. The tower is of the usual character found in the district, and contains five bells, all cast in 1733. Most of the original Perpendicular tracery remains, and that of the east window of chancel and north aisle is varied in design, and a good example of Early Perpendicular work. The whole of the exterior, including the tower, with the exception of the north aisle, has been treated to successive coats of rough cast and whitewash. This has been done several generations ago, and, if removed, would reveal the rich brown colour of the local stone of which it is built, and the edifice would have more of that quiet

dignity that pervades these old buildings hidden in the glen, and far from the noise and tumult of a busy town.

In the reign of Queen Anne silver was worked to some extent in the neighbourhood, and other minerals with manganese which has yielded a rich lode for the last hundred years. The poet, Hugh Downman, was born here in 1740. Newton St. Cyres is one of the most interesting villages in the neighbourhood of Creditor.

A pleasant walk through path fields, Newton wood, and a hard climb over a lofty hill and common known as "Waddlesdown" (from whose summit five counties can be descried, one of them said to be in Wales), then a short distance down a rugged lane, commanding fine panoramic views, we come to the village of Whitestone, whose whitewashed church tower can be seen standing out clear among the trees. The tower for many years has been a Trinity House landmark for the mariners in the bight of Exmouth. The church is dedicated to St. Catherine, and stands on a hill 700ft. above sea-level, and is of Late Decorated and Perpendicular styles. It consists of nave, north aisle, and chancel, also south porch and transept with western tower. Across the western end of the nave is a gallery carried on turned columns, the front is emblazoned with various heraldic shields, with the date 1621 and initials B.T. (which in all probability are those of Burnell Townsend, who was a landowner in the parish) carved on one.

The piers are octagonal on plan, and are granite monoliths; the caps are simple, and are of local stone with a plain chamfer; the arches are segmental and are very plainly moulded. There are remains of some fine old stained glass, consisting of the Virgin and Child, with emblems, in the north aisle win-

dows, a fragment of a coat of arms in the east window, and in the south transept or chapel other emblems, &c. The present screen is a simple one of Jacobean date, the upper portion having turned balusters supporting a carved frieze, the lower part being panelled. It is situated in the last bay of the nave arcade, and divides it from the north aisle. This probably formed a chapel or chantry.

Of the old fifteenth-century screen that stood across the chancel nothing remains but the rich cresting, composed of eagles with outspread wings, and this was found some time since; it is now placed on the sill of the east window behind the altar. Similar cresting is to be found in Exeter Cathedral, and in all probability is from the arms of the Speke family, who held large estates in the parish. Without doubt there was, at the end of the north aisle, at one time a Speke chantry. A chantry of this name is at present in Exeter Cathedral, and there are other villages in the neighbourhood that bear traces of this family. The church at Bramford Speke, about five miles north from Exeter, contains coats of arms in the windows to this family; the small south transept of this church doubtless contained a chantry for the Spekes. Whitestone Church has been well restored through the munificent generosity of the present rector and his brother. The latter presented a fine organ, and also had the bells rehung. There are some ancient flagons and paters belonging to the church, one by the celebrated Ions, of Exeter, dating from about 1570; also a silver one presented to the church by Nicholas Hall, who was rector of the parish towards the end of the seventeenth century, and another pater of much later date presented by Minister Barnard, who was rector in 1756. There are a few interesting slabs in the church; one in the south transept dates 1680, and others dating from 1617 and 1671. The lettering on these slabs is very clear and deeply cut.

The tracery of the windows, with one or two modern exceptions, is the original Decorated and Early Perpendicular, and of very good design. As shown in the sketch of the exterior, the Decorated work is on the south side of the church; these windows are of two lights. The finials on the coping are very late, and work of the seventeenth century.

On the north side is a blocked door, probably the north entrance to the nave. The whole of the exterior bears the whitewash of many generations, and it has been conjectured that the white appearance of the church has given the name Whitestone to the parish.

In the churchyard is the remains of the old village cross, and there are several ancient vaults and tombstones. On the south side is an altar tomb to the memory of the Sowdon family, the inscription being almost illegible, and dates from about 1675. The church forms a picturesque feature in the landscape, standing as it does with the trees for a background, and, according to the ordnance survey, the top of the tower is 700ft. above the sea level. It is a stiff climb to this little church, but it well repays a visit. The rectory adjoining has remains of a Perpendicular door and window. Near to the church are stables built for the

purpose of parishioners to bait their horses, who have to travel far to get there, the parish being scattered, and the church very isolated. This is interesting in the fact that few are now to be seen, and we only know of one other instance in the county, and that at Rockbeare, an isolated spot some six and a half miles east of Exeter. The village contains many fine old cottages, a sketch of one is given. These cottages are covered with thatch, and are very picturesque.

About half a mile from the church a stiff climb brings us to an elevated spot called Waddlesdown, before mentioned. This word means high or high land. It is derived from the gaelic *Wad* hill, *Al* high, *Dow* land, and well deserves its title, as it has before been stated that an extensive view of five counties can be seen. It only remains to add, from this splendid situation can be seen countless villages, while church towers are to be seen on all sides, and a fine view of the city of Exeter, with its grand old cathedral and many towers and spires. To the east may be seen the shores of Exmouth and the coast line of Dorset, with a glimpse of the Channel; on the south the hills and tors of Dartmoor stand out plain, and make a ragged line against the sky; to the west, on a clear day, may be seen the Welsh coast and the Bristol Channel, and further north-west the Somersetshire hills are seen in the distance, including the famous hills of Exmoor, noted for their connection with the Doone family. The view from this hill is almost unparalleled in the country.

About four miles west of Crediton lies the village of Colebrooke. Long before it is reached the church tower can be seen rising well above the knoll on which it stands. Colebrooke is a small village, and its only building of interest is the ancient church, as in all small villages there is little else beyond the church. Colebrooke Church is very interesting. It consists of nave, north aisle, south transept, and chancel, with south porch and lofty western tower. At the end of the north aisle is a parclose screen of unusual character and Jacobean in style, showing much foreign influence in the design; the tracery is filled in with minute fretwork, the mullions are composed of turned and twisted balusters, the lower part panelled with linen panelling; the portion on the south side facing the chancel has quaint cresting in the form of six pinnacles, each 1ft. 2in. high, formed of 4in. by 3in. pieces, and finished on the top with clustered foliage. The priest's seat and desk is an elaborate example of fifteenth century carving, the ends being carved their full length with kneeling figures (savages) bearing coats of arms: the figure on the end of the priest's desk is entirely covered with scales. The north aisle dates from about 1450, and was doubtless the work of John Copplestone. The south transept contains two arched recesses with canopies and a piscina; there is also a hageoscope, so that

the altar may be seen from this portion of the building. This transept was in all probability a chapel. There is in the floor of the church a grave-stone to the memory of John Copplestone, Esq., 1455, and also his wife, who died two years later in 1457; others in the church date respectively 1666 and 1659. The tower contains six bells, the earliest dating 1627 and 1659, whilst the remaining bells date from 1751-1787, and 1887. From the summit of the tower extensive views may be obtained. The building has recently undergone restoration.

(To be continued.)

RIGHTS OF LIGHT.*

By A. A. HUDSON.

I PROPOSE to deal with the subject, as far as possible, from a layman's point of view, and to avoid legal terms. The question to be faced is whether anything can be done to remedy the existing state of the law, and obviate the great difficulties which are placed in the way of, or I might say added to, building operations, by the tactics of persons claiming rights of light. Those tactics are well known, and, therefore, it would serve no purpose to enlarge on them. Of course, there are two sides to every question, and the person whose light is to be affected has a right to protection. Now, in order to consider the possibility and advisability of legislation, it is as well to consider analogous legislation

IN THE CASE OF PARTY WALLS.

because otherwise it will be said "You are taking away private light" in an unprecedented way, but ample precedent will be found in the London Building Act for future legislation as to right of light. Before the London Building Act, and previous Acts dealing with party walls, there was constant legislation. The owner of the property upon which buildings were proposed to be erected, or rather reconstructed, often did not know whether the dividing wall was a party wall; and even if he knew that, he did not know what kind of party wall it was. A party wall may mean, first, a wall of which the two adjoining owners are tenants in common; secondly, the term may be used to signify a wall divided longitudinally into two strips,

* A paper entitled "The position of owners of property with regard to rights of light and other easements, with a suggestion for future legislation," read before the Society of Architects.

one belonging to each of the neighbouring owners; and, thirdly, the term may designate a wall divided longitudinally into two moieties, each moiety being subject to a

CROSS EASEMENT

in favour of the owner of the other moiety. In case of a longitudinal division between two neighbours, each of them could pare away one moiety; and if this was done, the moiety of the other owner might be of little use to him. Many other peculiarities and difficulties arose—more useful to the lawyer than to anyone else. All this doubt has been disposed of by the London Building Act, which constitutes every division wall a party structure with certain definite rights, and in case of any dispute the parties can refer to the arbitration of a technical tribunal. The objection raised to legislation in matters of this kind always is that private rights should not be taken away by Act of Parliament, unless there is a very strong case for so doing. Undoubtedly the London Building Act does take away private rights, but so do many other Acts. The Lands Clauses Acts compel a person to sell his property or his rights in it, and legislation of this kind is permitted because in the public interest it would have been disastrous to prevent great public enterprises being carried out, either at all or at such great expense by paying out blackmailers, as to render the enterprise a failure. In the case of party walls the rights as between private owners has been legislated for, and this offers a stronger case of comparison than the cases of great public enterprises, like railways, canals, and so on, where legislation has been, so to speak, between private owners and the general public. It must be remembered also that in the case of party walls, under the London Building Act, nothing in the Act authorises any interference with an easement of light or other easements, and this would include a right to support. But the powers conferred by the Act of dealing with party walls in all kinds of ways are so wide, that this reservation interferes but slightly with the useful operation of the Act. The person building must so deal with the party wall so that the adjoining owner's easements are not interfered with, but directly either a building or adjoining owner proceeds in any way to use the powers of the Act he brings himself under its powers and loses the rights which he had at common law. The question is in what way

BUILDING IN LONDON COULD BE SIMPLIFIED

as regards rights of light, by some such legislation as the London Building Act in relation to party walls and other matters. I think the first principle to be adopted is that disputes should be settled by a technical tribunal, and I think that the tribunal should be presided over or be assisted by a lawyer. The reason I suggest that a lawyer should be added is because the rights of neighbouring owners are much more complicated than in the case of party walls. The reason for a technical tribunal is obvious—instead of the disputants having to prepare elaborate models and to call in conflicting evidence of the facts, the parties would come before a tribunal composed of persons who understood plans, and who could and should view

THE SITE AND SURROUNDING BUILDINGS.

In the next place, the persons proposing to build should serve notice on the adjoining owners, and the meaning of the term "adjoining owners" would have to be defined so as to include occupants, trustees, reversioners, tenants, and all persons who might claim right of light. The notice, I think, should specify exactly what kind of building is proposed to be erected, and that the plans, sections, and elevations can be seen at the offices of the tribunal to be created to dispose of such cases. The parties on whom such notices are served should be called upon within a certain time to specify their objections, if any, to the proposed building. The building owner would then know the persons from whom he must expect opposition and claims. It would be difficult to take away an adjoining owner's rights to compensation for injury to light upon a failure

to answer such a notice, and it would not even be possible, I think, to settle the amount of compensation to be paid in any case before the buildings were erected. But the

OBJECT TO BE ATTAINED

would be to get settled at once, by a competent tribunal, whether upon the plans deposited the building owner should or should not be restrained by injunction; and I would suggest that no person who had been served with the notice, and had failed to object at the time to the proposed building, should be entitled subsequently to apply to have the building pulled down. If, on the application of objecting parties, an injunction was granted by the court, of course the building owner would have to make fresh plans; if no injunction was granted, then he would be free to build, but, on completion, he would be obliged to meet any claims made against him for injury to light or air. The distinction between an injury which will entitle an adjoining owner to an injunction, and an injury which would only entitle him to damage, has been more or less defined by many judicial decisions, but the principle of those decisions might be codified so as to strengthen and direct the tribunal who in the first case have to decide whether an injunction should be granted or not. This tribunal should, I think, be able to decide this preliminary question without a jury; but when the building was erected, unless the parties had in the meantime agreed, I think a claimant should be entitled to a jury if he wished it, the tribunal of course being the same. I do not think it necessary that the tribunal should only have to deal with matters of right to light. There are

A GREAT MANY DISPUTES

about building, engineering, and other technical matters which may well be disposed of by a similar court. One of the most important matters in view of legislation is to provide some remedy for the enormous costs which a litigant may be put to now without any means of preventing it. There are, as most know, two scales of costs, one between party and party, and these are all a successful plaintiff or defendant can recover; and another scale called solicitor and client costs, and it is the difference between these two which a successful defendant or plaintiff has to pay. In the cases in which expert evidence, models, and so on are required, this difference is very great. Eminent judges have already expressed an adverse opinion on these two scales of costs, but in the case of

A TECHNICAL TRIBUNAL

being created to settle and dispose of the matters I have indicated, the tribunal should have power to regulate the scales of costs as well as the procedure, subject to the approval of the Lord Chancellor. This was so provided in the case of the tribunal of appeal under the London Building Act. I think this tribunal affords an illustration of the advantage to litigants of having their cases disposed of by men with a practical knowledge of the subject. I do not say this because I am a member of that tribunal, but because persons have found out how promptly their claims are disposed of and how short the trial is, this being due in a large measure to the fact that the tribunal always views the site or the buildings, as the case may be. With a similar tribunal light and air cases might, I think, be disposed of equally well.

The organ at Freshford parish church has been considerably enlarged and improved, and has been erected upon a platform, which accords with the Architecture of the church.

The Leeds City Council has been recommended by the Sanitary Committee to accept numerous tenders for work in connection with the building of the new hospitals at Manston. The cost is £5051.

The Committee of Perth Town Council met with Mr. Westland, of Messrs. Blyth and Westland, engineers, and opened the offers for the new bridge. As it was found they considerably exceeded the probable estimate, they were remitted to the engineer for examination and report.

DECORATIVE DESIGN.*

By LEWIS F. DAY.

DESIGN was in the first place an Art, and in the second place it was a craft. The Art could not be taught, but the craft could, and the place to learn it was not in the school of Art at all, but the workshop. But then they wanted an ideal workshop, where the one and only thought was to do good work. Such a place might have existed at some time, but where could they find such a workshop now? Owing to whatever cause, possibly force of circumstances, the workshop of the present day was just the last place in the world where the learner was allowed, much less encouraged, to do what made for Art. That was

WHY SCHOOLS OF ART WERE NECESSARY

to supplement the practical workshop teaching, and not seldom to correct it; but, though the workshop, as they knew it, was artistically of much less help than the school, still the way to learn design was much more the workshop way than the school. One great resource of the practical designer was suppleness in execution. A student should never be allowed to make the designs in the air, or put down a line which did not mean something. He was certain that school teaching should be more on the lines of the ideal workshop. A student would get more out of it if the teaching was not so academic, and it was the recognition of this fact that had given rise to the demand for technical education. They wanted more practical education in their schools. There was

TOO MUCH TALK ABOUT ART

altogether. There was too much "swagger," though in all good workmanship there must be something which comes near to Art. They could not altogether separate good work from what was beautiful. Good workmanship blossomed into beauty, and that was Art. Out of workmanship grew character peculiar to the mode of work, and so they got what was called style. Technique pointed out the way to design. In every difficulty of design they required to consult the material. They wanted to know what form to give it, and the treatment to apply to it, therefore they must consult the material, which would point out the way. It had always pointed out the way. If they wanted to learn a design they must begin by trying to do something on the lines suggested by the circumstances.

* Résumé of a lecture delivered at Belfast.

EXTENSIVE alterations are about to be made at St. Aubyn Church, Devonport.

A NEW Wesleyan school-chapel has been built at Hexthorpe. The premises are in the back portion of the site, and on the frontage it is proposed to build a chapel at a future date.

A MEMORIAL BRASS to Thomas Arnold, D.D., has been placed on the north wall of Laleham Church. It is carved in brass, with letters in relief, the brass being designed and executed by Messrs. Benham and Froud, Chandos Metal Works, London.

The new organ is now in course of construction in Lincoln Cathedral. The contracts entered into are with Messrs. Willis for the organ for £23605, and with Messrs. Bergtheil and Young for the electric blowing apparatus for £357 10s.

The Office of Works are now securing the whole of the large range of offices in Westminster Palace Chambers, opposite the Houses of Parliament, which are being prepared to house the Local Government Board officials, who are to be moved from Charles Street while the new Government offices are building.

The Town Council of Plymouth has applied to the Local Government Board for sanction to borrow £22,306 for a Museum and Art gallery, £550 for street improvement, £2500 for public lighting, £15,800 for the reconstruction of sewers and the repaving of streets, and £1340 for the purchase and adaptation of premises for a fire and police station.

LONDON ARCHITECTURE.

OUR MOST BEAUTIFUL BUILDINGS.

A BATCH of distinguished artists and architects have thought it incumbent upon them to tell us what is the most beautiful new building that has lately been erected in London. These thirty academicians and aspirants to academical honours tell us that they are aghast at the unblushing manner in which Sir William Harcourt and the First Commissioner of Works have ranged themselves among the Philistines. Admirers of Harcourtian epigram will not need to be reminded that Sir William recently described Mr. Norman Shaw's New Scotland Yard as decoratively "inferior to the establishment of Messrs. Crosse and Blackwell on the other side of the water." To him enter the prophets, who rebuke him with their unanimous verdict that "of the public buildings erected by Government in London during the present generation, New Scotland Yard is the one of which London may be most justly proud." Disputes upon taste, although

within, but of its outward aspect the best we can say is that it is just the sort of building from which to look out at the statue of

BOADICEA AND HER PRANCING WAR HORSES.

And had the Romans been faced, upon their landing, with such an apparition as that, we are quite sure, continues our contemporary, they would have been very glad indeed to return at once to those three parts of Gaul from which they set out. But this matter of New Scotland Yard, its beauties and its graces, is only a very small part of the much larger question of the adornment of London. It is difficult to induce the foreigner, whether he come from Paris or from Rome, from Brussels or Vienna, to admit that London is a beautiful city. We are satisfied that, in certain aspects and in some conditions of light and atmosphere, it is an exceedingly beautiful place. Its crepuscular effects are superb. When an orange tawny sunset gleams dully through the film of smoke, touched with haze, which lies above the roofs, we get a variety of colour effects which it would tax the palettes of the thirty prophets to realise. As a matter of

utterly dwarfs the Savoy next it. It is precisely this organised artistic control which is London's crying need. It is of course a counsel of perfection to say that we want a Hausmann with plenary powers in his pocket and millions at his back. The County Council is too busily engaged in hounding down the landlords, and endeavouring to obtain control of the water supply, to have any leisure for making

"LONDON BEAUTIFUL, LONDON CLEAN."

The Office of Works, with the very capable assistance of Sir John Taylor, does what it can: but it is hampered and controlled in all manner of ways. Unfortunately (sometimes) we are not a people who take a bold grasp of things. It is not our way to make clean sweeps. Sir Christopher Wren was not allowed to rebuild London after the fire, as he implored to be permitted to do. Had he been given a free hand on that unique occasion, we should now have a city of broad streets and fine architectural masses. "Instead of which" we have to put up with squalid thoroughfares lined by garish shops and pretentious public

Old Cottages
Newfor. S. Cyres

nearly always fruitless, are generally beautiful opportunities for saying nasty things about the artistic perceptions of those who differ from you; and in this happy land every man is his own Committee of Taste in such matters as this. But it is somewhat of a shock to the common man, who knows what he likes, but cannot always give a better reason for his preferences than was forthcoming in the classic case of Dr. Fell, to find all the prophets prophesying falsely. We have no wish, says the St. James's Gazette, to dogmatise upon the matter; but we are pretty certain that most people agree with Sir William Harcourt rather than with the artists. There are

MANY WORSE BUILDINGS

in this capital than New Scotland Yard; but assuredly it does not arouse the artistic enthusiasm of most of us. It is, no doubt, quite different from everything else in the neighbourhood, which is hardly a recommendation; but to the untutored mind it presents itself as heavy, dismal, dark, and altogether inelegant. It may be the pink of convenience

fact, they have been very rarely realised. But the foreigner reckons little of these things. He looks for fine masses of Architecture, for stately streets as broad as the Thames, shady with trees and restful with seats, and he has to return home to find them. London is a city of mean streets, paved not with the gold of legend, but with the mud of fact. When, by a happy chance, we do obtain a really fine and adequate building, such, for instance, as the new Institute of Chartered Accountants, the narrowness of the streets prevents its being seen. We have few palatial buildings, and practically no grandiose ones, if we except St. Paul's Cathedral and Somerset House. Our municipal pastors and masters committed

AN ARTISTIC CRIME

when they failed to provide that the Thames Embankment should be lined with palaces fit to range with Sir William Chambers's great masses. Were there any sort of control over these matters, it would not have been possible to build the Hotel Cecil, which completely disfigures that end of the riverside, and

buildings which, for all the Art that is in them, might be designed by a little boy playing with a box of German bricks. Yet we need not be so pessimistic as to fancy that nothing can be done. It is unquestionable that, during the last twenty years, much has been accomplished in the widening of streets and in the general improvement of our everyday Architecture. There is no great reason to be ashamed of Northumberland Avenue, for instance, with its terra-cotta Constitutional Club and

ITS THREE GREAT HOTELS.

The club is really decorative, and the hostelrys, if not "artistic," are at least sightly. But generations will be needed to undo the mistakes and carelessnesses of the past. Should the Surrey-side Embankment advocated by Mr. Douglas Young ever be constructed, a splendid opportunity will be available to line the southern shore of the Thames with stately piles of brick and stone which, without being sombre, would yet be dignified and splendid. There is no reason in the world why we should not undo many of our mistakes.

GLASS PENS FOR DESIGNING.

BY THOMAS BOLAS, F.C.S., F.I.C.

MR. THOMAS BOLAS, F.C.S., F.I.C., whose recent work on "Glass Blowing and Working" was reviewed in our issue of the 30th ult., gave a very interesting demonstration on the making of glass pens, with special references to their use for design, before the Society of Designers yesterday week. Mr. George C. Haité was in the chair. Mr. Bolas gave many important hints on glass blowing in general, and went on to state that for the most part glass modelling is done by natural forces. Glass may be said to shape itself; hence the beautiful forms it assumes. It is most general to blow from glass tubes rather than from rods, as it allows of more speed and better application in the general forms. In delicate and complex manipulations it is usual to blow from glass rod, a tube being placed on a softened rod, and the rod then blown out into bulbs by means of this tube. In the case of pens, the nib is blown from the tube, the handle being of rod. It is best to have the handle of a pen of coloured glass, so that one can see where it is easily, and the nib of colourless glass, to allow of the ink being seen. In the bulbous nib of the pen a hole is provided by which the air can enter, primarily to allow the ink to flow, and should be made of a funnel shape, so that when taking ink from a brush it is easy to insert the ink. A hole of a small size is made by blowing hard internally at the spot where the glass is softened, while in the flame; but if a funnel-like hole is required, it is obtained by blowing continuously, while out of the flame, thus producing a thin elongated bulb, which is broken off, leaving a large hole, the edges of the hole then being rounded off in the flame. The point of the nib is made by drawing the bulb, first made at the end of the pen, out until it parts, the end cut off, and the sharp edges rounded off in the flame. The pen points can be bent to any angle so as to suit the artist, and where required to draw on horizontal surfaces the point is turned slightly downward, and for drawing on vertical surfaces turned upwards, which latter pens, Mr. Haité stated, would be very useful, as he did not know of any other pens which would write in this position. Of course, no guarantee could be given to make pens of exactly the same size and shape, and also the amount of

ink they would hold would be determined by the capillarity of the nib. Mr. Bolas then went on to state that for making the fluted glass stylus he had found an improved method. The common stylus was drawn out to a point from a fluted rod, but he had grouped together a bundle of six rods round a central one, and had drawn the seven out together, thus obtaining a composite rod of the same section as the seven, having re-entering angles. The composite rod was then drawn out to a point until only the central rod remained on the point, and whereas in the case of the common stylus the point is ragged, he ground his even on ground glass or a hard stone, such as is used for hones, water only being used in the grinding. If these were introduced on the market the point would best be left rough, so that the artist could grind the point for himself to whatever thickness of line he desired. In conclusion, Mr. Bolas said that glass-working at the blowpipe was of great value, for as glass was capable of most beautiful treatment, models could be made at home by the blowpipe, and then made on a larger scale from the model at the glass-house, which models would possess the advantage of having been already made in glass, and thus being capable of reproduction, and, not as in the case of some designers, whose designs it was impossible to carry out. He showed as an instance of how glass could be made to shape itself by winding a thin rod of softened glass on a closed tube, and then blowing to a bulb, when the glass formed a perfect spiral, the pitch of which was determined by gravitation and the angle at which the shaft was held.

THE old Prince of Wales's Theatre, off Tottenham Court Road, is to be pulled down. It has been sold by auction. It has not been used as a playhouse for many years.

THE foundation-stones of the new Sunday schools in Higher Tranmere, Birkenhead, have been laid. The schools, which are to accommodate about 600, will cost £3600. The plans have been prepared by Mr. T. W. Cubbon.

IN connection with the proposed memorial to Sir Frank Lockwood it has been decided to (1) To obtain a portrait of the late Sir Frank Lockwood, to be placed in the National Portrait Gallery. (2) To place a brass to the memory of Sir F. Lockwood in St. Margaret's Church, Westminster. (3) To erect a tablet or other memorial to Sir Frank Lockwood's memory in York Minster.

KEYSTONES.

STRAND improvements continue to be the order of the day in that greatly frequented region. The eastern approach to the Hotel Cecil is fast approaching completion. The demolition of the shops will reach eastwards as far as Carting Lane, one of the oldest thoroughfares leading down to the Thames in that part of London, and at present one of the approaches to the Savoy Theatre. How it will be dealt with finally has not yet been settled.

THE removal of thick incrustations of dirt and varnish from the old woodwork above the outer central doors of the northern porch of Westminster Abbey, prior to polishing it, shows that the wood is thickly penetrated with a great quantity of small shot, and bears bullet marks. The old doors beneath were removed about three years ago to admit of a freer method of egress, and they were riddled in a similar manner. The Abbey workmen engaged in cleaning the woodwork say it is four or five hundred years old. It is of very thick oak, and studded with large iron bolt-headed nails, and it and the old doors have filled a space about 15ft. in height by 7ft. in width.

THE Strand Board of Works recently considered a report of the Improvements Committee dealing with the important subject of the widening of White Hart Street, by the carrying out of which there would practically be a straight line 40ft. wide from Catherine Street to the recent improvements in Clare Market. Mr. Cox, in moving the adoption of the report, remarked that this much-needed improvement could not be effected except at great cost, unless by arrangement with the Duke of Bedford, who would otherwise build on the area, leaving the present narrow street and insanitary conditions unaltered. As the result of negotiations with the Duke of Bedford's representative, the Board had been able to arrange that the latter's contribution should not exceed £3000. The vestry of St. Martin-in-the-Fields had agreed to contribute £5000, and if the London County Council contributed three-fourths of the net cost, estimated at about £32,000, the work could be carried out. It was proposed that the London County Council should be communicated with, and that the improvements should be carried out in co-operation with that body and St. Martin's Vestry. The report was confirmed.

All the above, with exception of thickest four parallel lines, drawn with one pen.

STAGES IN THE MAKING OF A GLASS PEN.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
April 13th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

MR. A. J. NUTT has been appointed by the Queen as clerk of the works at Windsor Castle, in the room of Mr. Robert Howe, deceased. Mr. Nutt has hitherto held a position under the Dean and Chapter at Windsor, and he will now combine the two appointments. He has carried out considerable decorative work at the Castle, and his services are highly valued by the Queen.

AFTER a considerable amount of deliberation, assisted by the advice and experience of Mr. G. T. Hine, who was chosen as consulting architect, the Birmingham Lunacy Asylums Committee have selected the firm of architects they wish to recommend the Council to appoint as the designers of the new lunatic asylum for the city. At a meeting of the committee the report of Mr. Hine was received, and they had an interview with him. He recommended that the plans marked "Forward" should be selected, and the committee unanimously decided to recommend to the Council the authors of those plans (Messrs. Martin and Chamberlain) as the architects of the new asylum.

OBSERVANT folks passing Ludgate Circus lately could hardly have failed to note the disappearance of the familiar obelisk that, about the middle of the seventies of the last century, was erected in honour of John Wilkes, of North Briton fame, when he was Lord Mayor. By reason of certain excavations in progress it was found necessary to take down the monument, but it will be re-erected when the work is finished. A print of 1795 shows this obelisk surrounded by railings and posts, with lamps fixed to the stonework. The obelisk facing Wilkes's commemorates another civic dignitary, Robert Waithman, who was Lord Mayor in the twenties of the present century, and who was a doughty champion of Parliamentary reform. His shop was situated at the south-west corner of Ludgate Circus, but was taken down when the circus was constructed in 1870. These monuments stand on the covered-over Fleet River, and the space between them was anciently the Fleet Bridge.

WRITING to the St. James's Gazette, Mr. B. H. Holland says:—"From the Marble Arch to the Bank stretches the long, unlovely street called Holborn at its eastern end, and at its western, Oxford Street. Through its whole noisy and crowded length it is unbroken by the sight of a green tree, nor is there a seat on which the weary wayfarer can repose. About half-way, a little to the north of it, the front of the British Museum, which is, in spite of defects, one of the most impressive pieces of massive Architecture in London, lies completely hidden behind a block of houses lying between it and Oxford Street. If to beautify London is within the programme of the present

County Council, I would suggest for their consideration an improvement which would be a benefit for all classes. Let them obtain powers to buy up the whole block of buildings between Oxford Street and the Museum, and then transform the site into a well-planted piazza-garden with many a seat and a municipal café in the centre. This would be an oasis of refreshment and shade on summer days. Some future Council might drive thence a true boulevard due southwards to the Thames. London fails in two great respects—first, that there is no effect of ensemble, that the streets and great buildings do not co-operate. Second, that no main street in London is broad enough to allow people to sit on chairs in it and drink beer and coffee, and smoke, and observe the passing throng. This is partly the reason why most Londoners hate London, and are always pining in the warmer weather to escape to the country. And a Parisian forced to dwell in London in the summer must indeed be an unhappy being."

THE Council of the Imperial Institute has authorised the holding of an exhibition of acetylene gas apparatus in the grounds of the Institute at an early date, and, in order to ensure that no apparatus should be admitted to the exhibition unless it was shown to fulfil the requisite conditions of safety, the Council of the Society of Arts has appointed a committee to decide upon those conditions, and to lay down rules for the admission of apparatus.

THE restoration of Bradford Parish Church is being proceeded with rapidly. Antiquaries will be interested to hear that it has been resolved to open the recently discovered "squint" (an aperture made in the chancel to enable persons to see the altar from the side chapel or whilst in the aisle) into the church on the north side of the chancel, and that the priest's chamber will be rebuilt as muniment rooms, so that this quaint feature will be preserved in its original form. The outlay was originally estimated at £6000, but it will now exceed that sum.

THE London County Council, at its meeting last week, received a report from the Fire Brigade Committee recommending that the work in connection with the enlargement and alteration of the Hampstead firestation should be carried out by the Works Department at an estimated cost of £4900. Tenders were invited for the work, and several were sent in, the lowest amounting to £4854, but in this case the tenderer intimated that he could not accept the Council's payment clause. The architect's revised estimate for the work was £4637. The next tender amounted to £4986. The committee recommended the acceptance of none of the tenders, and that the work should be carried out by the Department. The same Committee recommended that the work in connection with the erection of a building for the Battersea river station should also be entrusted to the Department at an estimated cost of £7533. For this work also tenders were invited.—Both reports were adopted.

At a largely attended meeting of the Liverpool Chamber of Commerce, Mr. John J. Webster, M.I.C.E., of London, explained at length a scheme which he and Mr. J. T. Wood, M.I.C.E., had prepared for carrying a roadway bridge 62ft. wide over the Mersey from Liverpool to Birkenhead. The proposal is to start in St. George's Crescent, Liverpool, passing over the site of the buildings between and at the rear of the James Street and Red Cross Street properties, turning to the left along Strand Street, then crossing the Lock Pit between Wapping Basin and Salthouse Dock at an angle, and on to the riverside south of the Manchester Dock, where the east abutment of the proposed bridge would be erected. From this position the bridge would cross the river, and be carried to the corner of Hamilton Square, Birkenhead. The estimated cost of land and bridge was £2,750,000.

VISCOUNT PEEL recently opened a free picture exhibition at the Public Hall Canning

Town. He expressed his surprise at the quality of the pictures got together, and remarked that he agreed with Zola's definition of a picture, as Nature seen through the medium of an artist's temperament. If a man were worth anything he would throw his own character into the picture he painted, and the artist who gave to us what was natural and beautiful would command the largest suffrages. There was in all of us a latent quality, not only of criticism, but of appreciation, and, though a picture giving a striking scene of history or of violence, but without artistic value, might appeal to the masses in a greater degree than some unobtrusive piece of scenery of great merit, the better picture would secure its own approval in the long run. Except, perhaps, the few born artists, we all require to see pictures through the artist's eyes, and the more we were educated the more would we admire the great pictures which in the different galleries of Europe were the wonders of the world. Hogarth had shown us there were plenty of objects and scenes in the common walks of life worthy of transference to canvas. There was a harmony in Nature—Lorenzo spoke to Jessica of the harmony that is in immortal souls—a harmony which, perhaps, we might not appreciate so long as we remained in this mortal sphere, but a harmony of which we might be able to catch something under the teaching of the great artists.

THE Cairo correspondent of the Times says: French engineers have been decidedly unlucky over bridge building in Egypt. The Erubabeh railway bridge crossing the Nile near Cairo, completed in 1892, was last year discovered to be in such bad condition as to be positively dangerous for the passage of trains, and is now being repaired at a cost to Government of £40,000. The price paid to the French builders was £84,000. The new bridge at Nag Hamadi, in Upper Egypt, lately opened for traffic, caused during its construction a great loss of life amongst the workmen by the upsetting of a caisson, and is now again in trouble. This is owing to the turning gear of the swing span (used for passing boats through) resting upon wheels instead of live rollers, as is usual, and consequently much greater friction is produced. The gear not having been made of corresponding strength, the teeth chipped off when the span was used, finally disabling it, so that the span has to be hauled round with ropes. The girders have the faults which good engineering authorities say may be expected from Continental competitive designs, viz., the sections are cut down to what is required by theory irrespective of the limit of a minimum thickness, which experience has shown to be essential for durability. It appears to be the custom in France to build bridges for Egypt of basic Bessemer with punched holes, in which case the thinner the plates are the better, so that to a certain extent the one evil compensates the other.

A FEW days ago, while digging the foundations for the Church House, in connection with All Saints, Dorchester, the workmen came upon part of a tessellated pavement and other indications of a Roman villa. A porringer in a good state of preservation was unearthed a few feet below the surface, together with a vase, apparently of great age.

ARE we really to have an expenditure of some five or six thousand pounds of public money upon founding in bronze the statue of Boadicea? The public, says the St. James's Gazette, has clearly never believed that the matter would be seriously taken up by the County Council, or else it would have pronounced emphatically upon the acceptance of what is nothing more than a second-rate piece of sculpture. If the Council is so anxious to spend money on the decoration of London with statuary, it would be doing better, almost, to accept Mr. Adrian Jones's group which he designed for the summit of the arch on Constitution Hill. It, again, has no pretensions to being an exceptional work of Art, but it would meet a want and complete a design which at present is decidedly deficient.

Tomb of Sir John
Sulley
Crediton, Devon

SKETCHES AROUND LONDON. No. 1.—STRAND-ON-THE-GREEN, CHISWICK. DRAWN BY H. F. W. W.

THE Thoresby Society recently met in Leeds to hear Mr. S. J. Chadwick, F.S.A., describe some "Old Glass in Dewsbury Church." Originally the glass was in several windows, but it is now in the north transept window, having been rearranged in 1887 by Mr. Knowles, of York. It comprises some very fine examples of fourteenth century glass, including what are called quarries, which consist of various specimens of birds, animals, and foliage, all beautifully drawn and executed. The window bears several coats of arms. There appear the arms of the Earls of Warren (once the owners of the Manor of Wakefield) and their ancestors, the St. Martins, as well as the shields of Scargil, Lathom, and Despencer. Some beautiful borders are supposed to be commemorative of Eleanor, wife of Edward I. The window is further enriched by symbols of the Evangelists and three roundels of the seasons—winter, summer, and autumn—which are considered most remarkable, and almost unique.

THERE has been a transformation at the Oval from the old irregular pavilion to a new palatial structure. The cost of the change is likely to be considerably above £30,000. The new red-brick building, with Bath stone facings, has a frontage of 300ft. It much surpasses in its imposing nature its model—the Lancashire pavilion at Old Trafford, Manchester—and also the handsome red-brick and terra-cotta work at Lord's. Both inside and out the buildings are in a very forward state; but the contractors—Messrs. Foster and Dicksee, of Rugby—are greatly indebted to the openness of the winter for the advanced state of the works. For the new tavern some 28ft. of the space in front of the old building has been absorbed in order to provide a better way between the pavilion and the hotel. This alteration still leaves a good approach to the Oval gates by the curve which has been made. The best places for following the game have been given to the gentlemen engaged in the cricket; their dressing and sitting rooms command an exact end-on view of the cricket pitch, while the professionals have almost an equally good position. On the ground-floor of the pavilion the secretary has a room commanding the whole of the ground, and immediately above him is the committee's place. For the public a spacious luncheon-hall has been constructed at the back of the hotel.

UNDER the auspices of the Carpenters' Company, at the Carpenters' Hall, Dr. G. B. Longstaff recently lectured on "The Municipal Control of Buildings." In the course of his remarks, the lecturer referred to the difficulty of the municipality controlling buildings. In the case of a city such as London, difficulties were inherited from bygone ages, because the buildings were already in existence with all their faults and imperfections, and, therefore, almost beyond control. In the case of a new town springing up it would be a very easy matter to draw up a code of regulations which should be fair and equitable for all the needs likely to be met with; but in the case of a great established city like London the details presented such an infinite complexity of varieties in the size, style, characteristics, and purpose of the buildings and the streets in which they were situated that one hardly knew what to do. Why, then, attempt to control buildings? it might be asked. Why not let every man build as seemed good in his own eyes? It must, however, be remembered that as soon as people came to live in towns they ceased to be independent in their actions. True and perfect liberty of the individual could not exist in any town. What one did must affect many others. No man could be allowed a liberty which injuriously affected others, and hence the need for building legislation. Improved sanitary conditions were necessary to counteract the decline in the healthiness of the various occupations, and the crowding into small spaces of large masses of population. In conclusion, he touched upon the need of making beautiful the buildings in large towns, because, as the years went by, the increasing size of those towns made the natural beauties

of the country less accessible. He strongly condemned certain abuses of advertising which disfigured the fronts of houses, and he mentioned as a curious fact in this connection that in Regent Street there were no such eyesores. The street belonged to the Department of Woods and Forests, and, while advertising of the obnoxious character referred to was forbidden, as a compensation the exteriors of the premises were painted by the Government every two years, instead of every three. He pleaded, too, for the preservation of interesting old buildings, expressing especial pleasure at the fact that St. Mary-le-Strand, although threatened more than once, still remained.

MANY lovers of Old London will regret to hear that there is a prospect of our losing the interesting old gateway which, at the south-end corner of Smithfield, leads to the Church of St. Bartholomew the Great. The whole of the ground between this point and Aldersgate Street was originally granted to Rahere, minstrel to Henry I., who founded the Priory of St. Bartholomew in 1102. On this site grew up a large monastic establishment, enriched by the profits of St. Bartholomew's Fair, held on Smithfield. The Priory had gardens and orchards, and a magnificent church, of which the present Parish Church of St. Bartholomew the Great was only the choir. With the Reformation, the Priory fell into the hands of a greedy courtier, Lord Rich, afterwards Lord Holland. He pulled down much of the Priory and let its grounds out on building leases, while he built a great house for himself in Cloth Fair. That house still exists and bears his arms. On the site of the Priory grew up the winding network of thoroughfares now called Bartholomew Close. Here lived Hubert Soeur, the sculptor of the statue of Charles I., now at Charing Cross. The present gateway is of the Early English period architecturally, with a finely-pointed arch, consisting of four ribs, each with numerous mouldings, receding one within the other, and decorated with roses and the "dog-tooth" work familiar to antiquarians. It was undoubtedly the entrance to the south aisle of the old Priory Church. The aisle has vanished altogether, the gateway has had a brick house built over it, and is now the principal entrance to Bartholomew Close. Since the great fire on the other side of Aldersgate Street, eastward of this spot, it is proposed to drive a new street right through Bartholomew Close, and in that case the gate will probably be pulled down.

At a special general meeting of the R.I.B.A. on Monday 4th inst., Mr. Alex. Graham, F.S.A., who was in the chair, proposed, in accordance with a recommendation of the Council, that Professor Aitchison, R.A., be requested to allow himself to be nominated as president for the year 1898-9, and that consequently bye-law 26, which limits the duration of the presidential term of office to two years, be suspended. Mr. John Slater seconded the resolution, which was carried unanimously. A meeting to confirm the necessary suspension of the bye-law will be held on the 18th inst.

THE exhibition arranged at Messrs. Tooths' Galleries, Haymarket, is of the usual order in so far as miscellany of schools and of subject in the pictures go, but it seems of rather higher level than the shows of the last year or two. Some of this favourable impression is due to the small room being given chiefly to watercolour drawings by the earlier English masters, together with examples of one who can stoutly hold his own with them—Thomas Collier—and a couple of tiny drawings by Chevallier, extraordinary for character and for microscopic execution. The drawings by deceased British painters are not of the quality we are accustomed to find at Agnew's, but that is not to say that nothing but the best is a desirable possession.

THE annual spring exhibition at Mr. McLean's Gallery, Haymarket, is about equally formed by British and by foreign paintings. The Russian painter Harlamoff fills one post of

honour with a picture of a young girl in very incongruous attire and carrying long-stemmed chrysanthemums, "A Strolling Player." Her face is rather pathetic, and, as usual with Harlamoff, is somewhat morbid in the fleshy tints. Opposite it is the large "Whispers of Love" by M. Bouguereau, that has been in public before. Its academic chastity and faultless draughtsmanship are agreeable. On the centre of the long wall a meretricious and feeble example of Munkacsy is seen in "In the Conservatory." These are the largest but not the chief pictures.

A CORRESPONDENT writes to the Times:—"The history of the Fragonard pictures at Grasse, which have recently been purchased by an English Art dealer, is a very curious one. They were painted in Paris by Fragonard, a native of Grasse, for Mme. du Barry's house at Louveciennes, but had not been finished when she was arrested and condemned to the guillotine. Fragonard, in alarm lest he should share her fate, went off to Grasse with his paintings, and lived there in obscurity for many years. The pictures, which represent the seasons, then passed into the possession of his son, a pupil of David, who thought them execrable, and at his death in 1850 the house and its contents became the property of two brothers, distant relatives, who had no higher opinion of these pictures. They were taken by one of the two at a valuation of £20, and would have perhaps remained for ever unknown had it not been for M. Sardou, who, as the story is related with much detail by M. Jules Claretie, made the owner acquainted with their artistic and commercial value, but could not persuade him to part with them to the State even for a high price. He had allowed M. Sardou to understand, however, that he might give them to the Louvre if the Legion of Honour was conferred upon him, and M. Sardou had secured the assent of Gambetta, then Prime Minister, to this when the latter's short-lived Ministry fell, and the project was never carried out. The owner of these beautiful compositions, which all the leading critics of the day now regard as Fragonard's masterpieces, had since then declined to listen to any proposals for their sale, and was even very reluctant to let them be seen; but he has at last been tempted by the offer of £60,000, and, as M. Jules Claretie says, 'they are now crossing the Channel to represent French Art of the eighteenth century among the Reynolds and the Gainsboroughs.'"

CARDINAL VAUGHAN has recently issued a circular to the clergy of his arch-diocese giving an account of the work done to date in respect of the new metropolitan cathedral at Westminster, and particulars of the work yet to be done. The circular states that the cathedral will consist of a noble porch, a narthex or vestibule extending across the whole width of the cathedral, a campanile, a nave, and two aisles, with eight side-chapels, and transepts; a sanctuary 4½ft. above the nave, with the Blessed Sacrament Chapel and the Lady Chapel at the sides; beyond the sanctuary a raised choir, 13ft. above the nave, for the chanting of the divine office, with a crypt beneath it; a spacious gallery over the aisles, and at the west end; behind the Blessed Sacrament Chapel, two vast sacristies, and other rooms connected with them. Internally, the appearance of the cathedral, it is stated, will be exceedingly impressive—with the full view of its 342ft. of length; its vast nave much wider and higher than any nave in England; the twelve lower arches, on each side of the nave, supporting the stately gallery; above each two of these arches, a lofty arch of 73ft. in height; above each two of the latter, a still loftier arch of 90ft.; and, rising above the highest arches, the three domes of the nave. Besides the nave, there will be the aisles and the side-chapels; the transepts, with the two spacious chapels opening into them at each side of the sanctuary; and the whole interior will be so proportioned, in the subordination of its various parts, that, vast as the cathedral will in reality be, its dimensions will appear even greater than they are.

Surveying & Sanitary SUPPLEMENT.

APRIL 13TH, 1898.

MASONRY.

BY JAMES WILDING.

II.—MOULDS FOR THE COPING, &c., OF A SKEW GABLE.

THIS is a difficulty of common occurrence, as it often happens that a building has to be erected at the angle of two streets that are not square with each other.

In dealing with this problem the simplest methods have been followed, in order to ensure a result easily understood by all.

The small sketch plan A illustrates the position of the building proposed to be dealt with, better than any amount of description could do.

The vertical height of the roof is given. The obtuse angle K Z made by the two streets is 120 degrees. The acute angle L T is parallel to it, or 60 degrees. See Fig. 2.

Now examine Figure 1.

It will be seen that the plan of the top bed of the coping is put in position, and the elevation at front and back revolved into view. To perform this operation for the back elevation, set up at M the vertical height of roof—the dotted lines at K and L on plan represent the wall lines; draw M K—M L. Now draw the coping parallel to M K—M L; from the extreme projections 1—2 and 3—4 draw vertical lines; this gives the elevation at the back. Repeat this operation, and the front elevation is turned down into view. From examination of Fig. 1 it will be seen that the joint lines are square to the face line; this is to avoid the very objectionable form of the feather edge. At the acute side the coping rests in such a way that it appears strong, but on the obtuse side, with the joint line being squared from the face, it looks as if it would slip out. This is prevented by notching the joint. If the projecting lines are carefully followed it will be seen that each mould required for the preparation of each stone is clearly set forth. Take the right-hand springer, or footable, B. The mould marked B is the front face mould, B1 the bottom bed mould, and B2 is the back face mould. The joint mould to fit X Y of this stone is the one described in Fig. 2 and lettered S H A P; this will be described later. The piece of coping C, C1, C2 has for its bed mould a parallel piece of zinc, and is worked to a parallel thickness. The angles of the faces are those of the mould S H A P.

THE APEXSTONE.—D is the mould for front face, D2 that for the back face. The angle line D1 represents the line of intersection of the two roof pitches.

It will be seen from reference to the figure that the extreme thickness required is shown by the back-face mould D2. It is always well to let the elevation that is in sight be as uniform as possible; the level line is used here to give the apex a good bed. The left-hand side of the apex stone is notched, so that the back is larger than the front to remedy the appearance or possibility of slipping referred to.

The piece of coping E is worked parallel as to thickness. The mould for the joints is that shown in Fig. 2 and marked J G N I. The mould for left-hand springer F, F1, F2 is

obtained by a repetition of the work described for right-hand springer. Observe the lines marked Director A—B—C (Fig. 1); these give the relative position of the stones on the back and front faces.

FIG. 2. TO FIND THE JOINT MOULDS.—Take the one marked S H A P. Draw K Z—L T—to make the angles of 120 and 60 degrees respectively with K L. This angle is taken for convenience only, the angle from the ground plan would be placed here for actual work. Bisect K L in W, erect W M equal in length to the vertical height of roof above wall plate, connect

angle 5 and the dotted lines being exactly similar to the joint mould J N G I. In order to remove any doubt in the matter, the mould for the obtuse joint is developed on its own side—the student is desired to compare it with the angle 5.

JOINT MOULD J N G I.—At any point in M K, say V, erect V U at right angles to M K, with U as centre describe the arc V J, from U, at right angles to K L, draw U Q; produce Q to W, parallel to K Z, and draw W X parallel to U V; take distance W X and mark it from Q, on the line drawn perpendicularly to Q U, thus

Figure 1

Sketch Plan showing Position of Gable.

B.B.B² Springer or Footable
F.F.F² Do for other side
C.C.C² Copping
E.E.E² Apex Stone

Figure 2

Showing method of obtaining angles for Joint Moulds

M L M K, at any point in M L, say R, erect R O at right angles to M L; from O draw O T to touch the level line, represented here by the wall plate; with O as centre and O R as radius, describe O S; connect S T, parallel to S T, draw A P, mark off width of coping S H, then draw H P parallel to S A; this gives the joint mould for the acute side. By a little examination it is easily seen that the mould for the obtuse side is also given by this working—the

obtaining the point X I; connect X I J, draw N G, i.e., thickness of coping, parallel to J I; draw width of coping I G parallel to J N—the enclosed mould is the one required for the obtuse side. Any detail can be used in the containing lines S H A P, J N G I—the straight lines being used for the sake of simplicity only. The student is recommended to set himself various angles in order to test his grasp of the principles used in this example.

EVAPORATION.*

By W. N. TWELVETREES, M.I.Mech.E.

IN Nature, evaporation is restrained by the weight of the superincumbent atmosphere, which keeps other substances within their proper spheres. Nevertheless, vaporisation takes place to some extent under all circumstances and at all temperatures, bearing a definite relation to the elastic forces of vapours evolved from various liquids. It is also affected materially by the pressure, velocity, and humidity of air passing over liquids, and by the surface exposed to its influence. These conditions must always form the subject of inquiry when dealing with appliances used for

EVAPORATIVE PROCESSES.

By the aid of calculation, the required volume and temperature of air may readily be determined, as also the number of heat units expended. Economy is frequently attained by the utilisation of waste heat from various sources. The most satisfactory test of any apparatus as to efficiency is to be found by an examination of respective temperatures and degrees of humidity of air at the point of exit. It is always desirable that the apparatus should be constructed of material possessing low conductive power, and that the internal fittings should be designed so as to expose the greatest possible surface and to prevent the escape of unsaturated heated air. Buildings used for the

DRYING OF VARIOUS SUBSTANCES,

whether building material, chemicals, or textile fabrics, should be used continuously, if possible, and not constructed in a manner sometimes adopted, in which the rooms are cooled down intermittently. Such a practice causes a considerable waste of power. When practicable, air should be delivered, not only on the outer, but also on the inner surfaces of the objects, the system being always modified to suit individual requirements, and when a building or room for drying is divided into separate compartments the

SUPPLIES OF HEATED AIR

are preferably placed under automatic control. Further, dry warmed air should be delivered at various points between the first place of entry and the exit, so that the process may be equable throughout. When natural draught is employed, attention must be paid not only to the height of the ventilating shaft, but also to area required by dilatation of volume caused by heat and by the presence of vapour, and the respective areas of the inlets and outlets must be calculated accordingly. Mechanical draught by the aid of fans is generally to be recommended, and renders easy the regulation of the quantity and velocity of air admitted, without the risk of fluctuation by disturbing causes, which are always apt to affect even the best symptoms of natural ventilation. Most evaporative processes in which heated air is employed are preferably conducted on the positive system, and pressure fans or blowers are therefore most suitable. Open fans, although extremely useful for exhausting purposes, are less satisfactory when used for blowing, and the greater area of ducts necessary is often a drawback. The friction of air in pipes must always be reckoned, and when branch pipes are used, the areas must be apportioned with due account of this factor. Steam, when available, forms the

MOST ECONOMICAL AND SATISFACTORY MEDIUM

for heating air, providing the water condensed be fully utilised without losing heat by relaxation of pressure. Stoves may also be used, but present a risk of fire, and, owing to high temperature, may vitiate air to an undesirable extent. Where steam heaters are employed, the size should always be minimised, especially in view of the fact that loss of heat by radiation and by contact of air is approximately

proportional to the surface exposed. Drying chambers for textile fabrics and clothing may be heated by stoves used in various ways, and also by high-pressure hot water and steam, particular care being taken with all

INTERNAL ARRANGEMENTS,

and the inlets and outlets being contrived so that the air traverses the chamber in a circuit. The outlet should be near the floor-line to assist in attaining this result. By the employment of mechanical draught in conjunction with a suitable steam heater, hot air may be distributed to several such chambers, and very satisfactory results obtained. The proper protection of air pipes by non-conductive material affects the temperature obtained to a marked degree. Timber drying-sheds as used on a large scale are most suitably arranged to work on the progressive system, in which the timber is stacked on cars, each holding about 4000ft. of timber; the cars are gradually pushed forward on rails in a direction opposed to that of the air. Thus the material comes under

THE INFLUENCE OF AIR,

increasing in dryness as the process approaches completion. The largest timber sheds have a capacity of 500,000ft., and a daily drying capacity of 125,000ft. Timber sheds are built in separate compartments, and special arrangements are made for the convenient treatment of small pieces, and for wooden ware generally. The best results are obtained by varying the treatment to suit different kinds of timber. Green yellow pine usually requires a high temperature and rapid circulation. Oak and walnut are exposed to a large volume of air at lower temperature. Continuity is always recommended. The regulation of temperature, volume and humidity of air, is easily effected when fans and steam heaters are used. Bricks may be dried by the aid of a similar apparatus, the chief differences being the dimensions of the building and of the cars. The former usually contains ten cars, each holding 500 bricks.

POTTERY AND CEMENT WORK

of various kinds is treated in sheds resembling those previously described. Wall paper, glass paper, &c., is usually suspended in a drying chamber on rods, to which motion is communicated, and the heated air is blown along the floor in an extended form. Chemicals, salt, sugar, starch, paint and grain are generally dried on shelves or screens, and the air should travel at moderate velocity because of the relatively small service exposed. Fibrous material, such as silk, wool, hemp, &c., should be spread on a frame having the top formed of wirework. Air is then blown through the material from the interior. The surfaces should be turned from time to time, and ample means must always be provided for the escape of saturated air. Tobacco, formerly dried by natural evaporation, is now treated by warmed air, on the progressive system, as described in connection with timber-drying arrangements. Drying cylinders, as used in cotton, woollen, and other mills, can only be briefly noticed, owing to want of space; and evaporative processes conducted in a partial vacuum, with or without the aid of heat, although equally deserving attention, must be reserved for some future occasion.

The Local Government Board has written a long letter to the Manchester Corporation declining to sanction the proposal of the Rivers Committee to deal with the sewage effluent by the bacteriological method of treatment, as an alternative to the defeated culvert scheme by which it was intended to convey the effluent to the Mersey estuary. The Rivers Committee have decided to recommend the City Council to carry out the bacteriological system in spite of the Local Government Board, and borrow the money without the sanction of that body, as they can under the Public Health Act. The estimated cost of the plan proposed is £127,000. The Local Government Board's method of land filtration would, it is said, cost half a million.

THE BIOLOGICAL TREATMENT OF SEWAGE.

By J. AIRD MURRAY, C.E.

THE West Riding County Council has recently communicated with the Local Government Board, asking whether it is prepared to pass sewage disposal schemes on the biological system, without further treatment on land, in view of the recent experiments which have been made in this direction. Seeing that sewage disposal is becoming a question of general interest and of great importance in this district and elsewhere, it may be of some use to explain shortly what is meant by the "biological system" of sewage treatment, and what the experiments are which have recently been made. There are

TWO GREAT DIFFICULTIES

in connection with sewage disposal; the first, obtaining sufficient land for filtration and irrigation purposes; the second, dealing with the solid sewage or sludge which it is necessary to collect and dry before disposing of. It has been found that if the solid matter in sewage be allowed to flow direct on to land, it very soon chokes the land, and renders it totally unfit for sewage disposal purposes. The most popular system of sewage disposal has therefore been that by which the greatest amount of solid matter has been kept back in settling tanks, and the liquid only allowed to flow on to land divided into plots. To perfect this system, various chemicals are mixed with the sewage to aid the precipitation of the sludge in the tanks. The Local Government Board and other authorities have set forth that chemical precipitation followed by land intermittent filtration is the one system which can be depended on for the best results in clarifying and purifying the sewage. It is generally accepted that the amount of land of an open friable character required for the above purpose is one acre per 1000 population, or for 20,000 gallons of sewage, and the depth of such land for filtering purposes should be from 4ft. to 5ft. The difficulty of acquiring such land at a spot suitable to receive the sewage is often extremely great. The sludge when collected is generally a nuisance, and a trouble to know what to do with, unless expensive machinery is laid down for drying and pressing it into portable cakes, even after which it is of little value as manure. The generally adopted system of sewage disposal may therefore be said to be

A SLUDGE MANUFACTURING SYSTEM.

It is very probable, however, that all this is about to be changed. The Massachusetts Board of Health, followed by Mr. W. I. Dibdin, late chemist to the London County Council, and others, has been making experiments which bid fair to open out a new era in the history of the efforts towards sewage disposal. These experiments point to the fact that it is possible to purify 1,000,000 gallons of sewage per day by passing it through an acre of filtering media (coke), with the almost entire removal or destruction of the sludge in the filtering bed. This is the biological system of sewage disposal. The biological system is founded on the line of Nature's work. It is known that organic matter is reduced in Nature to its elementary or mineral constituents by the life presence of minute organisms (bacteria). Remove these organisms from contact with organic matter, it will undergo no change whatever. Putrefaction is the result of their presence. The biological system simply helps Nature by providing in the formation and treatment of the filter bed an ideal media for the life and propagation of these organisms. These organisms are everywhere—in the earth, air, and water. They cause the disappearance of the manure we put in the garden from year to year; they destroy the leaves which fall in autumn, forming fresh food on which to build new organic life, and no matter how much and how varied are the chemicals we add to the sewage of our towns

* A résumé of a paper, entitled "The Theory and Practice of Evaporation as Applied to some Industrial Purposes," read before the Civil and Mechanical Engineers Society.

and villages, its ultimate putrefaction or reduction (unless by fire) can only be obtained by the help of these organisms.

WHAT IS GENERALLY UNDERSTOOD BY A FILTER

is merely a strainer, the keeping back of particles in the filter too large to pass through the filtering media. Such with continuous use soon becomes choked as the solid matter collects, and the filter is useless. But, on the other hand, if we can make the filter suitable to the life of the organic matter destroying organisms, the life of the filter becomes practically without limit. The one essential to the life of these organisms is the presence of oxygen; without, they will perish as sure as man does. In the biological filter, therefore, the presence of oxygen is the necessary feature. This has been partly understood for many years, as even in treating sewage on land it has been found necessary to divide the land into plots, so as to give each plot a rest in turn, and allow air to follow the sewage into the land. In soil, however, as we have said, the particles are so close that it is impossible to allow the solid matter to flow on to it. Hence the idea of a filter sufficiently open to take the sewage, after the gruset matter has been strained from it, and which will at the same time form a home for these organisms. Coke breeze has been found to serve best as a filtering media. In order to ensure the presence of oxygen, the filter is charged with sewage, and after a short rest of an hour or two allowed to drain off, when the oxygen of the atmosphere is drawn into the filter, and the

LIFE OF THE ORGANISM

maintained. Mr. Dibdin has been carrying out experiments in this direction both at the northern outfall at London and at Sutton, in Surrey. At London, from September, 1893, to November, 1896, 500 million gallons of sewage have been treated on a one-acre coke breeze filter, with the result that 2232 tons of sludge of 90 per cent. moisture have been entirely destroyed, sand and other detritus were carried into the body of the coke, and had no appearance of choking the filter. At Sutton, in Surrey, the Urban District Council has laid down, and has working satisfactorily, bacteria filters. The first filter laid down here was charged with burnt ballast, and received in 76 days, 2,216,000 gallons, equal to an average of 29,165 gallons per day, or 773,000 gallons per acre per day, rest included. The results were entirely satisfactory, the solid matters being reduced by 95 per cent., and by further treatment in a coke breeze filter by 99.6 per cent., and a total reduction of organic matter by 86.5 per cent. The amount of dry sludge which disappeared during these 76 days was equal to 77 tons. At the end of the above-

named period the task continued to work with undiminished success. Since the Sutton people have extended their filter-beds, deputations every week from other districts are viewing their successful working. That the biological system of sewage treatment is a step in the right direction cannot be doubted, and that its adoption will be a boon to many places where suitable land cannot be obtained is certain. On the other hand, where land is cheap and easily obtained, and of a suitable character for sewage treatment, and where market gardening may be furthered by sewage irrigation, it is a question whether the older system has not still the preference. In such cases a combination of the bacteria sludge destroying filter tanks and land irrigation on the intermittent system, appears to offer equally good and more profitable results.

THE Mersey Docks and Harbour Board Bill, which embraces a great scheme of dock extension, involving an outlay of £3,562,000, has been passed as an unopposed measure by the Earl of Morley, Chairman of Committees of the House of Lords. The scheme contemplates the construction, on the southern portion of the Dock Board's estate at Liverpool, of four new branch docks and two new graving docks, with a new deep water entrance to the existing Brunswick Docks, and, on the northern portion, two new branch docks and one graving dock, with improved entrances. The new docks are to be of sufficient length, breadth, and depth to accommodate the largest class of vessels building. Ten years are given for the completion of the works, but it is the intention of the Board to carry them out at the earliest possible moment.

The tender of Mr. Thomas Bell, of Market Weighton, York, has been accepted for the carrying out of the proposed works of water supply for the County Lunatic Asylum at Morpeth, per plans prepared by Messrs. D. Balfour and Son, civil engineers, Newcastle-on-Tyne. The scheme provides for the conveying of water in 6in. and 5in. mains from a copious spring at Doe Hill, in the Wotton Shields district, to the Asylum, a distance of seven miles. The mains will be of cast-iron, tested in the trenches after being jointed to ensure watertightness, and the necessary air, scour, and stop valves will be affixed. The spring can provide the present number of inmates with over 100 gallons per head per day, being greatly in excess of the forty gallons required by the Lunacy Commissioners. The spring, which is subject to very slight seasonal variation, will be enclosed by cast-iron cylinders, from which the water will flow to a covered storage reservoir. The water has been examined both chemically and bacteriologically, and found to be of excellent quality.

Surveying and Sanitary Notes.

An inquiry is being made by a committee, appointed by the Home Secretary, into the extent to which water gas and other gases containing a large proportion of carbon non-oxide are being manufactured and used for heating, lighting, and other purposes, and the dangers which may attend such manufacture and use.

THE new sea wall at Scarborough has been constructed as far south as what is locally known as Coffee Pot Rock, a distance of about 400 yards from the existing Royal Albert Drive, and there are already manufactured blocks for 250 additional yards. The date fixed for the completion of the contract is August, 1899.

THE Committee of the House of Commons have given their decision in the case of the opposition of the Great Western Railway Company to the Metropolitan Railway Bill, and also in regard to the opposition of the local vestries and the London County Council. As to the granting of powers to work the line by electricity, the Committee found the preamble proved, subject to the introduction of a clause protecting the interests of the Great Western Company by arbitration. Pending the introduction of electricity, powers to open new blow-holes for ventilating are conferred for five years.

PIPES for the carriage of water have from time to time been made of all kinds of materials, from the hollowed tree trunks which are occasionally unearthed in our cities to the paper contrivances soaked in pitch which have been recommended as efficient in more modern times. A Frenchman has recently invented a novel form of pipe for drainage and other purposes. A trench is dug in the ground where the pipe is required to be laid, and is partly filled in with good cement. Upon this soft substratum is laid a rubber tube covered with canvas, and tightly inflated with air. The trench is now filled up with cement, so that the tube is completely covered with an inch or more of the plastic material. As soon as the cement sets, the air is let out of the tube, and it is easily extracted from the pipe of which it for a time formed the core. The tube can then be again inflated to serve for a fresh section of the pipe, which can be as much as six inches in diameter if required. It is said that a cement pipe of this thickness has been successfully laid by the new method at a cost of about one shilling per yard.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
April 16	Windsor—Alterations to Laundry	Guardians	Surveyor's Office, 17, Park-street, Windsor.
16	Cairo, Egypt—Supply of Cement	Public Works Department	Inspector-Genl. of Irrigation, Public Works Ministry, Cairo.
16	Broughton, Lancs.—Erection of Police Station	Standing Joint Committee	H. Littler, 68, Fishergate, Preston.
16	Brighton—Erection of Hospital Quarters	Committee of Management	F. T. Cawthorn, 170, North-street, Brighton.
16	Farnedale, Wales—Erection of Club Premises	Conservative Club	A. O. Evans, Post Office-chambers, Pontypridd.
16	Lancaster—Rebuilding Bank	Liverpool Bank Ltd.	J. F. Curwen, 26, Highgate, Kendal.
16	Limerick—Erection of Two Houses		29, George-street, Limerick.
16	South Fernby, Yorks.—Erection of House and Stables	H. Brearley	H. B. Thorp, Architect, Goole.
18	New Brompton—Erection of Bakery, Flour Store, & Shop	New Brompton Economical Society	E. J. Hammond, 111, High-street, New Brompton, Kent.
18	Walsall—Alterations to Cottages, &c.	School Board	Bailey and McConnell, Bridge-street, Walsall.
18	Dewsbury—Extension of Schools		J. L. Fox, Architect, Bond-street, Dewsbury.
18	London, S.E.—Electric Lighting Station	St. Mary's Vestry, Newington	Kincaid, Waller, & Manville, 29, Great George-street, S.W.
18	Luton—Erection of Vestry and Organ Chamber		Rev. T. Bulman, 8, Union-street, Luton.
18	Newport, Mon.—Erection of Board-room and Offices	Guardians	B. Lawrence and Son, Architects, Dock-street, Newport.
19	Ipswich—Erection of Class-room	School Board	T. W. Cotman, Northgate-street, Ipswich.
19	London, N.W.—Extension of Generating Station	St. Pancras Vestry	Chief Clerk, Electricity Department, 57, Pratt-street, N.W.
19	New Tredegar, Mon.—Erection of Twenty-two Houses	Working Men's Building Club	G. Kenshole, Architect, Duffryn House, Ystrad Mynach.
19	York—Erection of Laundry Buildings, &c.	Workhouse Guardians	Penty and Penty, Architects, Lendal-chambers, York.
19	Sunderland—Post and Inland Revenue Office	Commissioners of H.M. Works	Offices, 12, Whitehall-place, S.W.
20	Halifax—Erection of Three Dwelling-houses, &c.		M. Hall, 29, Northgate, Halifax.
20	Shildon—Erection of Six Houses & Thirty-seven Cottages	North-Eastern Railway Co.	W. Bell, the Company's Architect, York.
20	Ulverston—Alteration, &c., of Boiler-house	Guardians	J. W. Grundy and Son, Architects, Ulverston.
21	Manchester—Retaining Wall	Parks Committee	City Surveyor, Town Hall, Manchester.
21	Wallasey, Cheshire—Engine and Boiler-house	Urban District Council	J. H. Crowther, Engineer, Great Float, near Birkenhead.
22	Halifax—Erection of Shops, &c.		M. Hall, 29, Northgate, Halifax.
22	Sheffield—Erection of Fire and Police Station	Watch Committee	J. Norton, Alliance-chambers, George-street, Sheffield.
22	Rosslynlee, near Edinburgh—Additions to Asylum, &c.	District Lunacy Board	Dr. R. Anderson, 16, Rutland-square, Edinburgh.
27	Norton Woodsents, near Sheffield—Erection of Lock-up	Standing Joint Committee	J. S. Story, Surveyor, Offices, St. Mary's Gate, Derby.
28	Edgmond, Salop—Erection of Agricultural College	Governors, Harper Adam Foundation	H. Teather, Architect, Andrew's-bldgs., Queen-st., Cardiff.

FURNITURE: PAST AND PRESENT.*

By W. ROLAND PECK, F.A.I., F.S.I.

IN using the word "Furniture," I propose to confine myself almost entirely to what is generally known as household furniture, as time would not allow of my dealing with it in its full meaning—that is, everything that is moveable. Our knowledge of furniture in the far away past is very slight. From sacred history we gather unmistakable proofs that many centuries before the Christian era, when the precise instructions were given for the building of the Tabernacle, these instructions were intended for craftsmen who must have had considerable experience in the working of woods, marbles, and metals. It must be particularly gratifying to those of my brother Masons who take an interest in this subject, to know that our first Master, installed nearly three thousand years ago, did so much for decorative fitting and furniture by gathering together for the building of the Temple

THE MOST FAMOUS ARTIFICERS

of the then-known world, and the effect of this enormous grouping together of the best workers, all anxious for the perfect fulfilment of this magnificent conception—undisturbed by strikes or other labour troubles—all working together in harmony towards one goal, must have been enormously beneficial in improving style and workmanship, and some of the finest existing examples of Art probably owe their birth to the influence and genius of our first worshipful Master. From the antique bas-reliefs in our National Museum, proof is given that carved wood chairs and couches of great beauty of design and clever workmanship were in everyday use 600 years B.C. In a daily paper a few days ago I read that what is doubtless the

OLDEST AND MOST VENERABLE PIECE

of furniture in existence was not long since deposited in the British Museum. It is the chair of Queen Hatasu, who reigned in the Nile Valley some sixteen hundred years before Christ, and twenty-nine years before Moses. This now dilapidated object seems to be of lignum vitæ. The carving of the front legs is elaborately inlaid with gold, and that of the back with silver. Again, in the Old Testament, constant reference is made to tables and beds. In the Book of Kings we read the beautiful story of the loving care of the Shunammite woman who saw that Elisha was a man of God, and said to her husband: "Let us make a little chamber on the wall, and let us set for him there a bed, and a table and a stool and a candlestick." It was as a reward for this care that Elisha promised that her long longed-for child should be born. Interesting as it would be to trace the development of

ASSYRIAN, ROMAN, AND GREEK FURNITURE,

I must in this short paper speak principally on British furniture. The early Britons, who led a wandering life, appear to have possessed little or nothing that we should term "furniture." These Nomads probably obtained their first idea of furniture from the chests in which they carried their valuables when away on hunting or fighting expeditions. These were used as seats, and as they were constantly in view they received various ornamentations, and as the people became less Nomadic these were followed by stools and rough tables. There is direct evidence in the manuscripts in the British Museum that as early as the eighth century an Anglo-Saxon chieftain possessed a house built entirely on one floor, and containing chests, tables, stools, and bedsteads. The latter, although little better than large boxes, with bags of straw placed therein, were the luxuries of the great, and not, until some centuries later did the ordinary Briton sleep on anything more luxurious than the earth-trodden floor. So far as history shows, Agricola, one of the earliest of the Roman governors, encouraged the Britons to accustom themselves to a slightly more pleasant mode

of living, and the conquered race slowly but surely learnt the use of mortar, cement, and the different tools used in building; and, as their huts or hovels became more comfortable, more articles of furniture were made and used. King Alfred, by his monastic schools and by strictly enforcing one of his edicts, to the effect that each priest should increase his knowledge of some handicraft, did much to promote manufactures, and greatly added to the comfort of the domestic life of his people. Up to the time of the Norman invasion, however, everything was very primitive. The male members of the family slept in the large hall used by day as the sitting or eating room, the mistress of the household, if of sufficient wealth and position, occupying a curtained recess with one of the box bedsteads I have referred to. The windows were for ventilation rather than for light. The fire usually burnt in the centre of the apartment; the first mention of

A FIREPLACE AND CHIMNEY

dates from close upon the twelfth century. Tables were formed from planks of wood laid on trestles: this is proved by manuscripts showing that after the dinner (with meat usually served on the spits upon which it had been cooked) the tables were cleared away, and the jesters, minstrels, and gleemen performed before our Anglo-Saxon forefathers. A less comfortable state of living followed the Norman occupation. Houses which, with few exceptions, had up to this period consisted of one floor only had a second story added; the awful four-poster bedstead—which is not yet, alas! quite a thing of the past—was introduced; ladies' dresses were richer in design and workmanship; and the Saxon "Worth" became and has remained a power in the land. At this period we learn for certain that feather beds were used, as one of the penances enforced by Holy Church for disobedience was not to enter a feather bed. In the thirteenth century wood panelling of walls of private dwelling houses is first mentioned. In 1236 King Henry III. issued a Royal precept as follows: "The

KING'S GREAT CHAMBER AT WESTMINSTER,

and the King's little wardrobe therein be painted a green colour like a curtain." Later in the thirteenth and during the fourteenth century Mediæval Art was approaching its finest period. Gothic Architecture had well set in, and it is important to note that at this time the furniture followed the fashion of the stone carving, and it is probable that the same hands which fashioned the cathedrals, monasteries, and mansions, also drew the designs for furniture, as the Church clearly secured the choicest examples of wood carving. The Coronation Chair now in Westminster Abbey was made for King Edward the First about thirteen hundred. "Penshurst Place," in Kent, the historic home of the Sydneys, is said by antiquarians to be the finest and truest example of what a rich gentleman's country house was in the middle of the fourteenth century, and, owing to the veneration care of the owners of this lovely old place, many of the original fittings have been preserved and can be seen to this very day. Jumping at once to

THE TUDOR PERIOD,

we see the doom of the old feudal castle, and in its place we have the high-roofed, gabled, and oriel windowed mansion. Skelton, writing of that time, says:—"Building royallie their Mansions curioslie—with Turrets and with Towers stretching to the starres." At this time we find the magnificent timber roofs; fine examples are to be seen in the great hall of Hampton Court Palace, in the Colleges of Oxford, and in Westminster Hall. About this time the custom of the head of the house of taking meals in the large hall with his retainers and dependents was partially broken up, and the "parlor" was first mentioned. Sir Henry Wootton, who was our ambassador to Venice, and who gave the well-known definition of an ambassador's calling as "an honest man sent abroad to lie for his country's good," wrote about 1600:—"Every man's proper mansion-house, and home being the theatre of his

hospitality, the comfortable part of his own life, a kind of private principedom, may well deserve to be delightfully adorned." Furniture to suit this new mode of living became necessary and was designed and made. In our South Kensington Museum there is a remarkable

CABINET OF THE SIXTEENTH CENTURY

obviously intended for use in a small apartment. About 1550 the taste for tapestry wall hangings revived, and the finest specimens in the world were produced in the sixteenth and seventeenth centuries. James I., in 1619, contributed £2000 towards the cost of establishing a manufactory of tapestry at Mortlake. In Elizabeth's reign furniture became more and more luxurious, and the carving more ornate and beautiful. This lively queen found time in the intervals of her love-making to very considerably aid the advance of taste and comfort in domestic furniture, and, reaping as she did, the advantages which accrued from the encouragement to foreign artificers given by Henry VIII., it is believed that greater strides were made in her reign than in any similar period of English history. Certainly the

MANY MAGNIFICENT MANSIONS

which were erected or designed during her life show that an immense advance had been made in the comfort of living. Two inventories belonging to this period are in existence, which picture for us exactly the contents of the principal rooms in two wealthy homes. The first, which I quote from Lichfield's book, refers to the parlour of Alderman Glasseor, of Chester, and reads as follows: "A drawing table of joyned work, with a frame, valued at forty shillings" (equal to £20 of our present money). The word "joyned" here shows that this table was of superior make, probably by the Gillow or Holland of that period, as the ordinary table in a gentleman's house at that time was usually made by plain boards being laid on trestles.

"Two forms covered with Turkey werke—a little side table upon a frame.

"A pair of virginals with the frame (valued at that time at 30s.)

"Six joyned stools covered with nedle werke, 15s.

"Six other joyned stools.

"One chere of nedle werke.

"Two little fote stools.

"One long carpet of Turkey werke." (I might, perhaps, mention here that carpet at this time meant table cover, as carpets as we know them were not used, the floors being always laid with straw or rushes.)

"One cupboard carpet of the same werke, 10s." (This we should describe to-day as a sideboard cloth.)

"Sixe guysshens of Turkeye.

"Sixe guysshens of tapestree.

"Eight pictures (valued at 40s.), Maps, and a pedigree of Earl Leicester in joyned frame."

This worthy Alderman was apparently a man of taste and culture, for I find he had not only casting-bottles of silver for sprinkling perfumes after dinner, but, to his glory, I find the inventory also contains a list of books. The second inventory describes the contents of the great chamber of Hengrave Hall, in Suffolk, where I may, perhaps, be pardoned for the egotism of mentioning that I had the privilege of dispersing by auction in August last, about £13,000 worth of old furniture and works of Art.

This inventory reads:—

"Long carpet of English werke.

"Long table.

"Square table" (which, by-the-bye, is the first time I see a square table mentioned in any old records.)

"Two cupboards" (these, doubtless, were the forerunners of sideboards and buffets of later times.)

"24 stools covered with carpet werke.

"6 stools covered with crimson velvet.

"2 greate chairs.

"2 scroll chairs.

"4 cushions.

"6 curtains.

"7-fold screen.

"4 branches of copper for lights.

* A paper read before the Auctioneers Institute of the United Kingdom.

"2 shovels, tongs and fire-fork, and walls hung with tapestry."

Before leaving the subject of inventories, may I appeal for more care in their preparation? We are not, I am sorry to say, improving as a body in this respect. I speak with some experience, as it is now nearly thirty-two years since I went with my uncle, the late Mr. Samuel B. Clark, to write down his description of the contents of a house in Gloucester Place, Portman Square. In those days we combined the business of a cabinet-maker and house agent. Mr. Clark was a cabinet-maker in the true sense of the term, and, as he was a designer of considerable skill, I learned under his able care to love good furniture, and despise bad taste and shoddy manufacture. The tendency of the present age is towards too much haste, hence we find in everyday inventories old furniture—even when it has distinguishing characteristics—all termed alike, "Chippendale," all foreign carpets called "Oriental," Japanese ware set down as Chinese, and *vice versa*. Elm is often called oak; rosewood becomes mahogany, and other glaring mistakes, too numerous for me to name, are made. If I can persuade one of our students to spend but one evening each week in our museums in the fascinating pastime of

STUDYING OLD FURNITURE,

this paper will have well served its purpose. Of ludicrous mistakes in inventories which have come under my notice, I could fill a book. A few I will mention, and then pass on. Two were both made by the same man, a genial, kind-hearted fellow, well known to my old colleagues. He made an inventory of a house near Weybridge, and I found on checking it, at the commencement of a furnished tenancy, that a beautiful picture of St. John was described as "boy with straw hat!" It is somewhat surprising he mistook the nimbus for a chapeau, for in an inventory he made of No. 3, Portland Place, at that time occupied by Mr. Edmund Yates, he described in the drawing-room there "a finely-carved marble mantel, supported by life-sized figures of angels." I well remember Mr. Yates asking me where he obtained his information as to the correct size of the inhabitants of Paradise. The poor old chap died long since, and so has been able to verify his measurements, and, I hope, for the credit of my old office, he found he was quite correct. Another instance of misplaced enthusiasm occurred in an inventory I checked some years ago of a house near Carlisle, where the agent gave the following description: "A shaped deal dressing-table with pink calico falls, covered with figured muslin, adorned with silk bows, and other elegant concomitants." In 1685 the persecution of the French Protestants after the revocation of the Edict of Nantes drove thousands of skilled workmen into England. These workmen added very materially to the

DECORATIVE ARTS OF THIS COUNTRY.

About the same time, marqueterie furniture, named after its inventor Marquet, first made its appearance in England. André Boule's furniture was also imported, and some of his choicest work has, by the Wallace bequest, lately become national property. This almost priceless collection was nearly lost to us by Government red-tapeism. Happily, however, the difficulties were overcome, and Britain has secured these Art treasures in their entirety. Later on, the carved and gilded furniture of Louis Quatorze, and the exquisitely painted furniture of Vernis Martin, were brought to this country. In the reign of William and Mary, I think we can first trace the influence of Oriental Art in the making of English furniture; certainly a great change took place in our style. Our trade with Holland, which was great in this reign, brought us in contact with the pottery and lacquer-work imported by Dutch merchants from China and Japan. Wood carving was also revived, and brought to a high state of perfection by

GRINLING GIBBONS AND HIS PUPILS.

His finest carving is to be seen at Chatsworth, Whitehall Palace, Trinity College, Mercers' Hall, and St. James's Church, Piccadilly.

Mahogany wood, although used for repairing ships as early as the time of James I., was not employed for domestic furniture until the eighteenth century. Once used, however, it rapidly became the favourite wood for cabinet making; the natural beauty and the fine polish it took fully compensated for its hardness as compared with other woods used up to this period. Satinwood from the East Indies also came into favour, and was the favourite ground work for the lovely painting of Angelica Kauffmann and Cipriani. Time has compelled me, very reluctantly, to strike out some references to specimen pieces of furniture which are now to be seen in England showing how we stood up at the time when Chippendale appeared on the scene. His advent led to a thorough and distinct change in the design of English decorative furniture. I have read a great deal of the criticism on Chippendale, but, admitting for the moment all that can be said against some of his styles, I maintain that we owe more to him for the beauty of household furniture than to any other designer that has ever lived. I prove this by the fact that he produced his great work in 1754, and to-day the highest and best English work is

BASED ON HIS MODELS.

Considering what we, as a nation, owe to Chippendale, it is strange to me that no monument to him exists. Very second-rate people, and "Mouthing patriots with itching palms," as the great historian says, have had their monuments, but nothing has been done for Chippendale—but, perhaps, the examples of his work in every cultured home serve as a better memorial than anything in stone or marble. Chippendale was largely influenced by French and Chinese styles, but he was not a mere copyist, and comparing the proved and authentic pieces of his furniture with similar articles made by his contemporaries, the king of designers stands out strong and secure in his overwhelming genius. That Chippendale was also influenced by the Dutch was clearly proved to me a few days ago when, by the great courtesy of Mr. D. L. Isaacs, I was allowed to inspect his rare and very valuable collection. Mr. Isaacs showed me an antique upright clock in a case darkened by age, and where the carving was the most characteristic piece of Chippendale I have seen—had it not been that the case was in old walnut-wood the keenest judge would have certainly catalogued it as a genuine Chippendale. One point we should not forget, that in all his exquisite tracery and delicacy of design, Chippendale never lost sight of the fact that furniture was for use as well as for ornament: the solidity of his workmanship and his superior finish are examples for all time. Of the lesser lights which illumined what is known as the Chippendale period, the greatest were the Brothers Adam, who designed furniture in harmony with their artistic interiors, most of which furniture was made by the old firms of Gillow and Dowbiggin.

(To be continued.)

From designs by Mr. Frank E. Smee, of 12, West Smithfield, two class-rooms are about to be added to the Leigh-on-Sea Board Schools. The tender of Messrs. Thorpe and Son, builders, Leigh, has been accepted, the amount being £1619.

THE contractors (Messrs. Price and Wills) have made such satisfactory progress with the loop line at Porthkerry, on the Vale of Glamorgan Railway, to take the place of the defective viaduct, that the work will shortly be completed.

THE efforts of the Scarborough Corporation to get the heavy gun battery removed from the Castle Yard at the summit of the famous Castle Hill, Scarborough, to land near the Artillery barracks on Burniston Road, have at last been successful. The Corporation are constructing a drive round the foot of the Castle Hill at a cost of £80,000. Unless the battery had been removed it would have been necessary when firing was taking place to close the drive to the public.

GREAT ART WORKERS OF THE CENTURIES.

BERNARD PALISSY, MODELLER IN PORCELAIN.

MAN has always loved to work in clay, and very beautiful have been the results of this appetency. The great early Accadian folk, who inhabited the plains of Chaldea, raised their immense cities of clay—bricks burnt or unburnt—and in their later civilisation made their books of the same substances, hundreds of which (in the form of tablets) were brought from Assyria by Sir A. H. Layard and M. Botta, and now enrich the galleries of the Louvre and the British Museum. And other nations were as ready to manipulate clay. The tombs at Bein-Hassan, in Egypt, which date from about B.C. 2000, contain pictures of various Egyptian trades and industries, including a pottery in which appears a potter's wheel for forming cups. The Egyptians, therefore, made a soft pottery in forms at a very early period. The Egyptians also had a knowledge from a very early period of the art of enamelling pottery. Articles enamelled in blue fifteen centuries B.C. are as bright and perfect to-day as articles of modern production. A knowledge of the art of working in clay was also possessed by the Phœnicians. Of their art we had but little knowledge until the discoveries made by General di Cesnola at Cyprus. The Phœnicians appear to have possessed the art previous to 1500 B.C., and from them the art travelled to Greece. Some of the

GRECIAN POTTERY,

especially their painted vases, are of the very highest order of merit. The Romans, always practical, appear to have valued pottery rather for its useful than its ornamental qualities, and displayed no very great skill or artistic ability in its manufacture. Western Europe appears to have owed its knowledge of the potter's art to the Saracens, who brought it to Spain, whence it made its way to Italy, Germany, and France. In the first named country (Italy) it flourished exceedingly during the fifteenth century, when the celebrated "Majolica" was fabricated. In Germany progress was not so great, while in France several predecessors cleared the way for the work of the great man to whose career this brief article is devoted. The origin of pottery in France appears to have been at a small establishment at Oiron, set up by Madame Hélène de Hauges-Genlis, widow of Arthur Gouffier, and continued after her death by her son, Claude Gouffier. She was a lady of high rank, and it is probable that the pieces of ware produced (which were but few in number) were rather intended as presents than for sale. They were of thin ware, and highly glazed. The decorations were produced by graving outline patterns in the clay, and filling in the designs with coloured clay. This ware is known as "Henri Deux ware" or "Faïence d'Oiron," and is very rare. At present only 53 specimens are extant, of which 26 are owned by France, 26 by England, and one only by Russia. The next French potter, in chronological order, was Palissy, of whom this sketch treats, and a very typical example of whose art is to be found, in the shape of a "reptile dish," in the Soltikoff collection, which was dispersed some few years since. The natural forms, leaves excepted, are very carefully moulded and true to Nature. The fossil shells are the tertiary shells of the Paris basin, the fishes are those of the Seine, and the reptiles and plants those of the neighbourhood of Paris. The moulds were, in all probability, formed from living specimens. Another fine specimen is also a "reptile dish" from the Marryatt collection. The precise date of the birth of this great artist is not exactly known. Some authorities give it as 1509, others as 1510, and the place of his birth is also involved in some security, but it is generally supposed to have been in one of the forest tracts which abounded at that time in the province of Périgord. His father is supposed to have been

glass painter, certainly he was not a potter, or Palissy himself says that when he commenced.

HIS FIRST EXPERIMENTS IN POTTERY

That he "had never seen earth baked," and he was brought up to the business of glass painter and worker generally in glass. The father of Palissy was probably of noble family, for all processes connected with the shaping and colouring of glass was considered an occupation which a gentleman might follow without losing caste. There were two or three such trades, and they were jealously guarded from outsiders. Parents taught them, who were not likely to communicate their secrets to strangers. In his childhood Bernard Palissy was poor, and probably received no more than a peasant's education, except that he learned to draw and paint on glass. Palissy left his father's house when about eighteen years of age, and wandered over France; at twenty-nine he married and settled down at Saintes. Here he was shown an elegant cup of Italian manufacture—"An earthen cup turned and enamelled with so much beauty that from that time I entered into a controversy with my own thoughts," he says, "and I began to think if I should discover how to make enamels. I could make earthen vessels and other things very prettily;" and later on he says, "thereafter, regardless of the fact that I had no knowledge of clays, I began to seek for the enamels as a man gropes in the dark." Again, "without having heard of what the said enamels were composed, I pounded, in those days, all the substances I could suppose likely to make anything, and having pounded and ground them, I bought a quantity of earthen pots, and after having broken them in pieces, I put some of the materials that I had ground upon them, and having marked them, I set apart in writing what drugs I had put upon each as a memorandum; then, having made a furnace to my fancy, I set the fragments down to bake, to see whether drugs were able to produce some whitish colour; because I had heard it said that white enamel was the basis of all others." For many weary months Palissy persevered in his experiments, "pounding and grinding new materials and

CONSTRUCTING NEW FURNACES,

and growing poorer and poorer every day. Finding that the furnaces built by himself were unsuitable for his purpose, he tried those of the potters near him, but here, again, he was doomed to disappointment, "for," he says, "when they had baked their batch, and came to take out my trial pieces, I received nothing but shame and loss, for they turned it to god for nothing," the potters' furnace not being hot enough. After many other trials and much anxiety, he again builds his own furnace, and struggles bravely, despite his deep poverty, to obtain the object of his desires. At this time, Palissy was about thirty-seven years of age, and although he had discovered the white enamel, yet he was far from being happy. Poverty pressed him; the quick, his family was large and increasing, his wife was a scold, and the neighbours mocked at his experiments. Yet still he persevered. At one time, owing to his poverty, being unable to purchase wood, he burnt up even the furniture of his poor home.

his furnace, to record in the end only another failure. He tried again, after many months of struggling. He had promised his editors payment this time; his furnace was in good order; his enamels carefully mixed, and everything seemed prosperous. Yet again his evil fortune followed him, for when he threw his batch from the furnace, "the pieces were all bestrewn with little pieces of it, so attached to the enamel that all were lost." This was a sore disappointment, but, at last, after many years of trouble and hard work, he succeeded in making what he called "rustic pieces," as he termed the pottery with the enamelled lobsters, tortoises, and snails, which we know in these days by the name of Palissy ware. This Art worker was imprisoned more than once for his strong religious opinions, and eventually died in the year 1589.

W. N. B.

MARBLE:

ITS SUITABILITY FOR SCULPTURED WORK.

SOME interesting comments have recently appeared in various contemporaries upon the subject of the suitability of marble for public statues in this murky English climate of ours. These comments have, presumably, been excited by the confident assertions of the manager of the Sculptured Marble Company of 11, Queen Victoria Street, E.C., as to the durability of the marble obtained from the Ravaccione quarry at Carrara. The manager of the Sculptured Marble Company has pointed out that marbles are of various qualities; that whereas some are almost as soft as chalk, there are others which have almost the hardness of granite. Both the statue and pedestal of the recently-erected monument to the Queen at Brighton have been wrought from Ravaccione marble—well known alike for its purity and enduring qualities. Its density is 2.597, and it is described by Professor Jervis as "clear white marble, of fine texture,

PERFECTLY HOMOGENEOUS,

and much more resistant than others on its surface." Those words were written in 1889. It was to the marble of a neighbouring quarry that Professor Jervis referred in the paper which he read before the Society of Arts, in 1860, when he said: "One quarry, four miles N.E. of Carrara, is acknowledged to date from Roman times, and to be the spot whence the marble of the Pantheon was obtained. Though originally erected by Agrippa, B.C. 26, that superb building is still in a state of good preservation." After this and other testimony it is just a little absurd to decry generally the virtues of marble for statuary. The statue of the Queen, at Brighton, is a fine work. Professor Nicoli, the sculptor, has a strong and, at the same time, a delicate touch. He well knows how to "infuse with life" the dead stone, and is singularly successful in regard to the fidelity of his portraiture. In his work there is, as a rule, the greater regard for detail and the finer finish, which are characteristic of Italian artists as compared with most of their English brethren. These qualities might not count for much in themselves if they were not united with nobility of conception and strength of imagination. Whether in great public monuments or in what is called "parlour statuary," he is equally a master. Amongst his more colossal works may be specially selected for mention the Bahia monument, representing the expulsion of the Portuguese from Brazil; it is 84ft. 6in. high. Of a similar character, and not less admirable, is the public monument in Carrara to Giuseppe Garibaldi, who, with Cavour and Mazzini, was one of the "makers of Italy." Professor Nicoli has been fortunate in obtaining commissions for public monuments of this character; for to him, also, the world is indebted for the monument to Columbus at Madrid, the monument to Cervantes at Acala de Henares (the place where Spain's great writer was born), the monument to General Accunador at Madrid, and the monument to General Barrios at Guatemala; not to omit to mention statues of the Queen for India and Australia, as well as five statues for Melbourne, Australia, representing Lord Beaconsfield, Mr. Gladstone, President Lincoln, President Garfield, and Charles Dickens. Monuments to Sir Theophilus Shepstone and other celebrated personages are also included in the works of Professor Nicoli. No mention of Professor Nicoli would be complete in which reference was not made to his

ECCLESIASTICAL WORKS,

foremost amongst which must be placed his two marble pulpits with bas-reliefs for the church of San Francisco, Madrid; his twelve apostles with pedestals for the same church, and his altar for the church of the R'spinnela, in Madrid, with the statue of the Madonna of the Conception. Professor Nicoli will doubtless become more and more known in this country, where he is represented by the manager of the Sculptured Marble Company.

Professional Items.

ABERDEEN.—The work of the erection of St. Peter's Episcopal Church, Torry, is now far advanced. The architects are Messrs. Kinross and Tarbolton, Edinburgh. In regard to the design, the first thing probably that will strike the spectator is the cathedral-like height of the building, which, in the interior, is accentuated by the comparative narrowness of the nave. The church is constructed on the design of a nave with projecting right and left aisles, but the aisles are supported on internal pillars, and are not intended for the seating of the congregation, so that the nave, with its series of slender pillars along each side, may be said to constitute the church proper. The width of the nave is about 35ft., and as the height from the floor to the apex of the arched ceiling is about 60ft., some idea will be had of the large extent of space in the interior. The north elevation is pierced by six windows let into the aisle. A line of dwarf windows is seen above the aisles, lighting the upper part of the interior near the roof. The elevation towards Victoria Road is more broken up. Various architectural features here appear, chief among which is a slender bell-tower, rising to a height of from 50ft. to 60ft. At the east end of the church the elevation is unpierced, and at the west end rough "tuskings" is left for the clergy house, which it is hoped to build at a later time. At some future period, too, it is intended to erect a choir and clergy vestry on the north side. The line of pillars along each side supporting the aisles is so numerous and close together as to hide the aisle windows from anyone not directly opposite them, and as these are the only windows in the church apart from the dwarf windows near the ceiling, there is this curious effect produced of the building being filled with a flood of light, while from the chancel, or the other end, no windows are visible. Pink granite has been employed in the construction, and in small oblong blocks, which gives a distinctly quaint and harmonious effect. From the floor of the nave several steps lead up to the floor of the chancel, at the east end, where there will be a fine altar, fully 12ft. wide. The connection between each pillar and the external walls of the aisles is in the form of a pointed arch, presenting an exceedingly pleasing effect when viewed from the end of the aisle. It is expected that the new church will accommodate about 600. The total cost of what it is intended to complete at present will be about £5000.

BALSALL HEATH.—The Methodist New Connexion have erected a chapel in Ombersley Road, Balsall Heath. The new building has cost about £2500. Built by Mr. George Webb, of Soho Hill, from plans designed by Mr. A. H. Goodall, of Nottingham, the chapel affords accommodation for 470 people. Of red brick, with Bath stone dressings, it is in the Decorated Gothic style of Architecture on the nave and aisles principle.

BARNSELY.—A new Congregational Church, in Farrar Street, off Dodworth Road, Barnsley, has just been opened. The building is from plans by Messrs. Hemsoll and Paterson, of Sheffield, and has cost £1200, exclusive of furnishing and site. The chapel will accommodate about 450.

BOOKING BRIDGE.—The foundation-stone of the new church and convent of the Immaculate Conception of St. Francis, at Booking Bridge, has been laid. The architect is Mr. J. F. Bentley, the designer of the pro-cathedral at Westminster. Messrs. A. Brown and Son are the builders, and Mr. W. L. Tett is clerk of the works. The buildings comprise the church, with sanctuary chapel and transept, cells, corridors, refectory, kitchen, and all the domestic requirements of a religious house. The church, which is to be of red brick with stone dressing, is designed in the Early Decorated style of Church Architecture.

CLEY-NEXT-THE-SEA.—One of the oldest institutions in the town is about to disappear,

the George Inn being demolished, with the two rows of malting establishments, to make room for a new hotel to be erected upon the site. The George is 300 years old at least, and the demolition removes a familiar set of buildings. The architect from whose plans the hotel is being built is Mr. Albert C. Havers, and Messrs. George Riches and Son, of Cromer, are the contractors.

GLASGOW.—The new municipal baths and washhouses in Kay Street, in the Springburn district of Glasgow, just opened, occupy a site some 2000 square yards in extent. They include a swimming pond, 75ft. by 30ft., attached to which are dressing-boxes, foot-baths, spray rooms, &c., at each corner, and a gallery overhead for spectators, the dressing boxes being built on a new principle, which will preclude the appearance of the rot which has hitherto been so destructive in these establishments; fifteen first-class and thirteen second-class hot baths for men, and five hot baths for women; whilst the washing-house contains thirty-four stalls. Instead of the usual timber, the swimming-pond roof is of steel principals, which gives the interior a lighter appearance. Mr. A. B. Macdonald, the City Engineer, prepared the plans.

GRANTOWN.—Messrs. Brown and Watt, architects, Aberdeen, have been commissioned to carry out a new scheme of church building for the Free Church, Grantown-on-Spey. The site is a fine one on the rising ground to the south-east side of the burgh, and the building will contain about 500 sittings. The front elevation will be built of freestone from the Morayshire quarries, with lead quarry lights and rolled cathedral glass in the windows. The height to the terminal on the belfry is 65ft., and the frontage to the public road is 51ft.

HECKMONDWIKE.—A public inquiry has been held at Heckmondwike with reference to the District Council's application for sanction to borrow £6000 for the erection of public baths and a fire brigade station, £1565 for street improvements, and £400 for a new boiler at the destructor works.

LEEDS.—The builders of Leeds are having a busy time. In all the outlying districts row upon row of new buildings are making their appearance. The gratifying feature of this development is that the majority of these houses are spoken for long before they are ready for occupation, which proves that the supply of new dwellings is not in excess of the demand. At a recent meeting of the Corporation Building Clauses Committee the number of plans submitted for new houses and business premises, and for alterations to existing structures, was 126. This establishes a new record.

The third public baths erected by the Leeds Corporation have been opened. They are situated in Holbeck Lane. Built of pressed bricks, with stone dressings, the structure has an attractive exterior. The central portion is three stories high, with a one story wing on each side. The floor of the building is raised about 5ft. above the ground level, and the two entrances are approached by broad stone steps. Over the offices is the manager's house. The cost of the Holbeck Baths is about £8500. Mr. Walter Hanstock, architect, of Leeds and Batley, prepared the designs, and the contracts were let as follows:—For masons' and bricklayers' work, Mr. J. T. Wright; carpenters' and joiners' work, Messrs. G. Oakes and Sons; plumbers' work, Messrs. W. and C. Barrand; engineers' work, Messrs. H. Braithwaite and Co.; fireproofing, Mr. McFarlane; iron-founder's work, Messrs. W. Horsfall and Co.; plasterer's work, Messrs. F. Branton and Co.; slating, Mr. W. Shevill; patent glazing, Messrs. W. Helliwell and Co.; and painting, Mr. Jonas Gaunt.

LINGFIELD.—The new Board school at Baldwins Hill, Lingfield, has been opened. The school, which has been built in the most modern style, is situated only a few yards over the Sussex and Surrey boundary line, close to East Grinstead. Including everything the

total cost has been £2986, and the school will accommodate 250 children.

LIVERPOOL.—The day schools in Dorset Street, Tuebrook, are being altered and enlarged. In the boys' department a new class-room, lavatory, and cloak-room are being provided in addition to the enlarging of the present class-room. In the infants' department there is the enlarging of the schoolroom and the provision of new babies' room and new cloak and lavatory accommodation. In the girls' department a new class-room has been added, and the present class-rooms have been enlarged, for use as cookery school, with scullery, store, complete range, &c., and separate porch for entrance, &c. New lavatory and cloak-room are also being provided. The

Herber Tower for a term of twenty-one years, at a yearly rent of £12. On this act is guaranteed the preservation, at least for a considerable time, of one of the few remaining fragments of the old town. Some eighteen months ago this fragment had come dangerously near to the doom of demolition. The Armourers, Curriers, and Feltmakers' Company of Freeman were then seriously considering an offer for the purchase from them of the Herber Tower, the intention of the purchaser being to raze it to the ground and erect new buildings on the site. In the midst of the negotiations towards this end, there came from the Society for the Protection of Ancient Buildings a strong appeal to the Council, "to prevent an act of vandalism which it is convinced would be considered by posterity as a

drainage scheme has been revised. The work is being carried out from plans and under the superintendence of Messrs. Woolfall and Eccles, 60, Castle Street, Liverpool, the contractor being Mr. W. Knight, of Tuebrook.

MOSELEY.—A new church hall has been erected at the corner of the Chantry and Alcester Roads, Moseley, by the Presbyterian Church of England. The church hall, which is a spacious, commodious building, has cost about £1300. It is built in the Early British style from the plans of Messrs. De Lacy Aherne and McKewan, Colmore Row.

NEWCASTLE.—Among the documents sealed at a recent meeting of the Newcastle City Council was a lease to the Corporation of the

disgrace to the town." Similar representation were made by the Newcastle Society of Antiquarians and by the Executive Committee of the National Trust for Places of Historic Interest or National Beauty. After considerable negotiations, the Stewards of the Armourers, Curriers, and Feltmakers' Company of Freeman agreed to lease the tower to the Corporation for twenty-one years at a rent of £12 per annum, the Corporation keeping the structure in repair.

NEWTON HEATH.—The new premises of the Failsworth Industrial Society have been opened. The site is at the corner of Oldham Road and Church Street, and has cost £4000. The buildings have cost about £14,000, and have been designed by Mr. F. W. Dixon,

Manchester and Oldham. They cover an area of 850 square yards, and have an imposing appearance.

PRESTON.—The plans for the proposed alterations to the Theatre Royal, Preston, prepared by Mr. John P. Briggs, of Effingham House, Arundel Street, Strand, London, were approved at a recent meeting of the Town Council. The pulling down will commence directly after Easter, and the theatre will be opened on October 3rd.

TOTNES.—A memorial window has just been unveiled in Totnes Parish Church. The window is of four lights with tracery, and a type generally met with in Devonshire churches. The upper part of the lower lights is devoted to large-sized figures, under rich canopies, and set on deep ruby and blue backgrounds. The work was designed and executed by Messrs. Couracre and Son, of Plymouth.

WESTON-SUPER-MARE.—The church illustrated on page 190 consists of nave, transepts, and chancel (with octagon end), organ chamber, vestries, &c. The roof will be wagon eaved, and, like most of the interior woodwork, will be of pitch pine. The architect is Mr. W. J. Morley, F.R.I.B.A., of Bradford, his design having been selected in a limited competition. The cost of the building will be about £6000.

WORCESTER.—A new infectious diseases hospital has been erected in the Newtown Road. It has been built at a cost, apart from site and furniture, of £10,000. The buildings consist of an administration block, with residential accommodation for the matron and staff, and separate blocks for scarlatina, typhoid, and diphtheria, a block containing wards for doubtful cases, and wards for private patients, and another block containing a disinfecting chamber, laundry, stores, &c.

WEYMOUTH.—A monument is to be erected at Weymouth as a memorial of the late Sir Henry Edwards, M.P. The monument, which is in light grey Kemnay granite, stands on a plain base 5½ ft. square. On this rests a second base, moulded; then follows the die-block, a massive piece of granite, on which rests an elaborately designed cornice. In its lower part the cornice is square, and is cut into tier after tier of heavy mouldings. In its upper part it is formed again in a series of mouldings into octagon form, and on it rises a column about 3 ft. in diameter at the base, and rising to a height—including the massive projecting capital—of about 13 ft. The upper part of the capital contracts by a series of convex mouldings till it meets the base of a Grecian urn with relieved handle, which forms an effective finish to the monument. Apart from the drapery of the urn, the monument is polished all over, and has a total height from the ground of 3 ft. The work has been executed by Mr. J. J. Oddie, Aberdeen.

YOXFORD.—The works in the partial rebuilding and enlargement of Cockfield Hall, Yoxford, which have taken upwards of two and a half years in execution, have just been completed. The mansion now contains one of the finest entrance-halls in the county. It is open from the ground floor to the first floor by a wide staircase, and has an arcaded gallery at the first floor level. On the ground floor the hall is subdivided by an arcade of three wide arches, access to the first floor being by a wide staircase, elaborately treated and carved. The walls are panelled in wainscot oak, the doors and other fittings being in similar wood. The windows contain medallions of heraldic glass, with the family quarterings. The reception rooms all open into the hall, and are fitted up in harmony therewith. The whole of the work has been executed from the designs and under the superintendence of Mr. E. F. Ishopp, architect and diocesan surveyor. Mr. Alfred Brown, of Braintree, was the contractor; Messrs. John Groom and Son, Ipswich, executed the carving and chimney-pieces; and Mr. George Beddingfield, Ipswich, the plaster ceilings.

Correspondence.

THE HEIGHT OF SCHOOLROOMS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I have read with much interest your report, on page 145, of Marsland v. School Board for London, as I have had in my district two large schools erected and additions made to many more. When I received the plans for the first new school since the passing of the 1894 Act, I carefully considered the question of teachers' room, and decided that, as they were probably used for a very short time each day for luncheon and tea, in addition to use as offices for clerical work, I might reasonably allow a height of 7 ft. 6 in. or 8 ft. to pass. I should think that usually one of the smaller class rooms would be used for managers' committee meetings.

Mr. Marsland deserves thanks for getting the matter settled by the Tribunal of Appeal. —I am, sir, faithfully yours,

HENRY LOVEGROVE.

124, High Street, Shoreditch, E.

Enquiry Department.

WATERTIGHT CELLARS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I should be much obliged if you would inform me of the best way to construct a watertight cellar to an existing building. The latter is 14 ft. wide by about 50 ft. long and 18 ft. high to roof plate; the walls are 14 in. thick, and go down about 4 ft. into the ground. An absolutely watertight cellar is required under ground floor; the level of latter corresponds with that of the ground outside.—I am, dear sir, yours faithfully,

"INQUIRER."

The building must first be shored up all round, and the walls underpinned just above the footings; then excavate to the required depth, and build the cellar wall, with an asphalted damp course at the level at which the top of the cellar floor will be found. This excavation and walling should be executed a bit at a time to avoid having the whole of the building supported solely by the needling. When the whole of the walling has been completed it must be covered on the outside with a damp resisting material, the best and only reliable one being asphalt; this should be carried up all round the building to a line at least 12 in. above the ground level. After excavating for the floor, cover the whole area with at least 6 in. of broken brick rubbish; lay thereon a 6 in. thickness of cement concrete, and cover the surface of same with asphalt, which must join, and be on the same level with, the damp course. The cellar thus becomes enclosed within a complete shell of asphalt, and will be absolutely watertight.

A QUESTION OF COMMISSION.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—A. employs an architect to carry out certain works. The architect, in the usual course, employs a quantity surveyor; the contract is let, and the work completed. The contractor complains that the quantities are in certain items short, and submits an account of what he considers to be the correct measurements. It then becomes necessary that the work should be measured up. Is the architect entitled to any further commission for satisfying himself and his client that the amount claimed is really due before granting a certificate, or can he refuse to do so, and merely give a certificate on the finding of an independent surveyor? If the latter, who is liable to the surveyor for his charges? Or, briefly, is an architect entitled to extra commission for measuring up work for the purpose of granting certificates on account and on completion for the total amount expended?—I am, sir, yours,

"SIC."

If it becomes necessary for any or all of the work under the contract to be measured, the person measuring is clearly entitled to be paid

for his services by the employer. In this case, the surveyor who had prepared the quantities would check the builder's measurements, and prepare a bill of extras which the architect would examine, and upon it make out his certificate. For this latter service architects rarely charge, but they get the usual commission on the total amount of work executed. If the result shows that the errors were serious, the builder may reasonably expect that his surveyor should be paid by the employer, and although he could not, we think, recover his costs, I have known some allowance made to him. The architect would not, we think, be able to charge for any work done in making up the amount due on each certificate.

CUBING TIMBER.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I notice in your issue of the BUILDERS' JOURNAL for March 30, an answer to a correspondent who asks how to find the cubical contents of different size timber. The answer to my mind is very old-fashioned and out of date. The easiest way would be to take the number of running feet, and multiply by the width and divide by 12, and then multiply the product by the thickness and again divide by 12, and the answer will be the number of feet cube.

Example take your reply given:

12 ft. of 2 in. × 9 in. × 9 in. width = $108 \div 12 = 9$ × 2 in. thickness = $18 \div 12 = 1\frac{1}{2}$ ft. cube.

or again take, say, 660 ft. of 2 in. × 4 in.

660 ft. × 4 in. width = $2640 \div 12 = 220$ × 2 in.

thickness = $440 \div 12 = 36\frac{2}{3} = 36\frac{2}{3}$ ft. cube 8 in.

There is a yet more simple way for small-sized timber, such as 1½ in. × 2 in., 2 in. × 2½ in., 2 in. × 3 in., &c., &c., which is to multiply the thickness by the width and with the result, multiply the running feet, and divide by 12 twice.

Example, take 720 ft. of 2 in. × 2½ in.; 2½ multiplied by 2 = 5:

720 ft. × 5 in. = $3600 \div 12 = 300 \div 12 = 25 = 25$ ft. cube.

There are several other ways which are in daily use, but I think the two ways I have shown are the simplest and most easily learnt. Hoping you will find space for this in your next issue, I am, yours truly,

H. O. S.

April 2nd, 1898.

SANITARY INSPECTORS' EXAMINATION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Will you kindly inform me through your enquiry column, the quickest and cheapest way of getting instruction for the Sanitary Inspectors' Examination? I am a builder's foreman, and believe that success in this examination would be very beneficial to me.—I remain, yours faithfully, C. W. P.

You had better write to the Secretary of the Sanitary Institute, Margaret Street, W., for the syllabus, and also pamphlet, containing particulars relating to the examinations and copies of examination papers set at previous examinations; price 6d. You could also obtain from the same source any other information you may require.

Just inside Westminster Hall, as you enter by the great door in Palace Yard, there are two or three holes in the flagging of the floor. They occur in a straight line to the right of the doorway, and have long ago been filled up with lead and cement, but the traces of them are, and will always remain, distinctly visible. Probably not a dozen people could attribute them to their true cause, and they may, in time to come, puzzle an antiquarian. During the last month of the trial of Orton, such crowds used to assemble round the doors of the Queen's Bench Court to see the claimant pass in and out that the police ordinarily on duty were unable to cope with them. So a barrier was put up, stretching from the gateway of the Hall to the steps up to the Court House, and to hold the iron supports these holes were cut in the flagging. There the traces of them remain, though the Court House has come down, and the Court itself only retains its name "as a concession to prejudice."

Trade and Craft.

A NEW FIREPROOF FLOORING.

One of the latest improvements in the way of fireproof flooring is at present being tested at Dundee, probably for the first time in Scotland, by Mr. Robert Keith, architect, Dundee, who has introduced it in the new stabling establishment in course of erection in St. Andrew's Street, for Mr. David Stratton. The invention comes from America, and is a combination of steel and concrete. Steel girders are set across the floor level at a distance of from 8ft. to 10ft. apart, and on top of these is placed a strong lattice work made from mild steel plates which have been cut and drawn out into wide meshes, resembling a net, and possessing great elasticity and strength. A temporary flooring of wood having been put in, concrete is applied to the depth of about six inches, completely enclosing the steel as in a sandwich, and, when the mass is solidified, the result is a flooring upon which, it is stated, fire could have little or no destructive effect.

MR. GEORGE WRAGGE, OF SALFORD, MANCHESTER.

The new National Provincial Bank at Leeds has been occupying the attention of Mr. George Wragge, of Salford, Manchester, for some time. The whole of the steel casements throughout the building, with bronze fittings, are the work of this firm, as well as the wrought iron balustrades for the staircases, wrought iron entrance gates, and grilles. But the most notable part of the work is the fitting of the interior with aluminium. This material has been employed in the making of the electric light fittings, Teller's counter grille, door handles, and all other furniture for the doors, book desk rails, standards, &c. This metal, as well as several alloys of a similar colour, is receiving Mr. Wragge's special attention in the reproduction of his artistic fittings. It may be mentioned that the firm has secured the contract for the casements for a large mansion now building in Philadelphia, and, as far as we are aware, this is the first use of metal casements in that city. The whole of the work is in bronze, and the contract, we understand, was secured quite apart from all question of price, the section and quality of the work being the main points for consideration. The result, no doubt, will be of remarkable effectiveness.

CONTRACTOR'S LIABILITY.

In the Queen's Bench Division, recently, before Mr. Justice Darling, the case of Jinks v. Lawrence and Sons was heard. It was an action for damages in respect of very serious injuries which the plaintiff had suffered whilst he was walking along the Strand. The accident happened on June 15 last. The plaintiff, who is now about fifty-seven years old, was a grainer and decorator. The defendants were builders and contractors, and were engaged doing some work at 336, Strand, in front of which place there was a hoarding which extended close to the kerb. The plaintiff was walking in the road past the hoarding, when a piece of timber, which weighed about 200lb, was being shifted through a window on the scaffold. The case for the plaintiff was that there was only one man upon the scaffold to receive the timber, that he was unable to control it, and had to go with it or let go. It fell upon the plaintiff, smashing his left foot and leg and seriously injuring his head. His leg had to be amputated half-way below the knee, and he was only able to move with difficulty with the aid of two crutches. Beyond

the injury to the limb, it was said that there was serious brain injury from which he would most probably never recover.—No evidence was called for the defendants.—The jury in the end found a verdict for the plaintiff, damages £500.

AN INACCURATE BILL OF QUANTITIES.

At Churston County Court, Marcus Bridgman, contractor, Paignton, claimed £18 11s. of F. W. Vanstone, surveyor to the Paignton District Council, for damage sustained by reason of defects in a bill of quantities supplied to plaintiff by defendant, &c. The claim was made up as follows: Cost of supplying and laying 290ft. of pipes for the purpose of laying on gas to a lamp, £8 1s.; services by Mr. V. C. Brown, surveyor, £4; balance on £30 lent by plaintiff to defendant, £6 10s. Defendant had paid the £6 10s. into Court with costs, and the £4 for Mr. Brown's services was withdrawn. In October, 1896, it appeared, the District Council required certain work to be done in Tower Road, Paignton, for which defendant prepared the plans and specifications. Tenders were invited, and plaintiff was among the contractors who tendered. It was necessary for plaintiff to get a bill of quantities, and he instructed Vanstone, in his private capacity as a surveyor, to draw up the quantities. It was for mistakes made by defendant in the preparation of the bill and for consequent damages that the plaintiff made his claim. A portion of the work was connecting street lamps with the gas company's main, and defendant did not show the distances. The practice was, if no distances were shown in the bill of quantities, to assume that only a few feet had to be laid. As a matter of fact, plaintiff had to lay over 200ft. of gas piping. Consequently the work cost him more than the £94, the amount of his tender, and he claimed for extras. The District Council referred the matter to an arbitrator, who decided that the work was not an extra as it was in the specification.—Verdict for plaintiff for £8 1s. with costs, the amount to be paid in monthly instalments of £2 each.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

AUDENSHAW.—For sewerage a portion of Droylsden-road, for the District Council. Mr. J. H. Burton, surveyor, 2, Guide-lane, Hookey-hill:—
G. Bell ... £262 5 0
J. Cooper ... 545 8 0
Worthington and Pownall ... 508 8 0
Etheridge & Clarke ... 502 13 0
T. Rowlands ... 459 19 0
H. Davison ... 446 11 0
W. Hurst ... £415 15 6
H. Kinder & Son, Hookey-hill* ... 393 9 6
R. Fish ... 388 4 0
J. Farrell ... 372 2 0
W. J. Froom ... 355 7 8
[Surveyor's estimate, £465 10s.]

BATH.—For the enlargement of Oak-street schools, for the School Board. Mr. W. J. Wilcox, architect, Belmont, Bath:—

	Extra for Brick dado.
W. Webb	£5,735 0
C. Wibley	5,557 10
E. Chancellor	5,462 0
Hayward and Wooster	5,347 0
Long and Sons	5,383 0

BRIDLINGTON QUAY.—For the erection of a pair of villas for Mr. E. Rhodes. Mr. J. Earnshaw, architect, Carlton House, Bridlington Quay:—
R. Bailey ... £1,775 0
J. H. Hudson ... 1,688 10
E. Wilson* ... £1,658 0
[Accepted]

BRIGHTON.—For the erection of a block of buildings for children at the workhouse, for the Union Guardians. Mr. H. S. Reed, architect, Parochial Offices, Prince's-street, Brighton:—
R. Cook and Sons ... £18,569
Sutton and Evershed ... 15,368
W. Brown and Son ... 15,113
Jay Bros. ... 14,900
Peters and Son ... £14,525
J. J. G. Saunders and Sons, Ivory-place, Brighton* ... 14,476
[Accepted]

BROMLEY (Kent).—For sanitary work at the St. Luke's Institute for the Trustees. Mr. Percy B. Strudwick, architect, Bromley, Kent:—
Gransdon ... £56 0 0
Haywood* ... 54 17 6
Poole ... 52 10 0
[Accepted]

DUDLEY.—For additions to premises in Parsons-street, Dudley, for Messrs. Goodwin, Foster, Brown, Limited. Mr. F. Foster, architect, Leamington and Coventry:—
J. D. Ruffell ... £2,577 1
Love and Flint ... 2,340 0
W. Holland & Sons ... 2,250 0
E. J. Charles ... 2,195 0
J. Ballow ... 2,165 0
J. Guest and Son ... 2,030 0
C. A. Horton ... 1,992 0
W. Willetts ... £1,977 0
E. and J. Secker ... 1,976 0
H. Dorset and Co. ... 1,925 0
J. H. Whittaker and Co. ... 1,890 0
W. Dealey, Dudley* ... 1,550 0
[Accepted]

HASLEMERE.—For erecting new house, called "The Lodge," Sottermill, for the Rev. G. H. Purdue, from the drawings by Mr. A. W. G. Harding, of Shottermill, Haslemere:—
Harding Brothers ... £427
Gardiner and Luff* ... £365
Cover and Hill ... 375
[Accepted]

ILKLEY.—For the erection of a block of shops and offices, for Mr. Jackson. Messrs. Isitt, Adkin, and Hill, architects, Prudential-buildings, Bradford:—
Masonry.—M. D. Featherstone, Wells-road, Ilkley ... £2,990 0 0
Joinery.—Lorthill and Balmforth, Little Horton, Bradford ... 1,387 1 7 1/2
Plumbing.—M. Houldsworth, Cunniff-road, Ilkley ... 418 11 0
Slating.—Wm. Atkinson, Kirkstall-road, Leeds ... 226 18 0
Plastering.—O. Lister, Poplar-grove, Ilkley ... 512 0 0
Painting.—G. J. Walton, Great Horton-road, Bradford ... 40 0 0
Shop-front Fitting.—Carr Bros., Ltd., Snowden-street, Bradford ... 610 0 0

IPSWICH.—For additions to schools, Wherstead-road, for the School Board. Mr. Thos. Wm. Cotman, architect, Northgate-street, Ipswich. Quantities by Mr. J. Sidney Parmenter, Ipswich:—
M. Dent ... £2,226
O. Roper ... £1,798
F. Bennett ... 1,935
R. Girling ... 1,752
Grimwood and Sons ... 1,896
Parkington and Son ... 1,698
C. Borrett ... 1,880
S. Kenney ... 1,638
G. Kenney ... 1,855
G. Sadler (withdrawn) ... 1,570
W. Grayston ... 1,816
A. Gayford (withdrawn) ... 1,451
[All of Ipswich.]

LEIGH (Essex).—For the erection of two class-rooms to accommodate 120 children, and cloak-rooms, &c., at the Boys' and Girls' Schools, Leigh-on-Sea, for the Leigh School Board. Mr. Frank E. Smees, architect, 12, West Smithfield, E.C. Quantities by Mr. J. E. Goodchild, 81, Finsbury-pavement, E.C.:—
Hammond and Son ... £1,797
Thorne & Son, Leigh* ... £1,610
West ... 1,750
Bullock and Patten ... 1,444
Symes ... 1,730
[Architect's estimate, £1,650.]

LEYTON.—For the erection of six houses, Vicarage-road, Leyton. Mr. A. L. Pridmore, architect:—
Inkpen ... £3,240
Barker ... £2,985
Fuller and Son ... 3,360
Snewin Bros. and Co. ... 2,850
Downs Bros. ... 8,200
Sizer ... 2,793

LONDON.—For alterations and additions at the "Bereford Arms," Bereford-street, Walworth, for Mr. J. N. T. Commercial, Messrs. Edward Brown and Son, architects, Commercial-street, Bishopsgate:—
Maxwell Bros. Ltd. ... £1,228 0 0
G. E. Todd & Co. ... £1,133 0 0
Wm. Young ... 1,200 0 0
Geo. Newton ... 1,122 7 3
Trent Bros. ... 1,179 0 0
J. V. Kiddle & Son ... 1,070 0 0
S. Salt ... 1,160 0 0
Taperell & Davis* ... 971 0 0
[Accepted]

Vaughan & Browne, Ltd.* ... £120
Jas. Steadman (too late) ... £117
R. Davies and Sons ... £276
Grimes and Son* ... £262
[Accepted]

LONDON.—For decorative and other works to No. 74 Park-crescent, W., for Mr. Charles Burge. Mr. Walter J. Ebbets, architect and surveyor, Savoy House, 115, Strand, W.C.:—
R. A. Yerbury and Sons ... £1,684 0
Bywaters and Son ... £1,130 0
J. M. Macey & Son ... 1,065 0
Maple and Co., Ltd. ... 1,235 10
Campbell Smith and Co. ... 898 6
J. Macintosh ... 1,227 0

LONDON.—For erecting bath and discharge rooms at Isolation Hospital, Muswell Hill, for the Hornsey Urban District Council. Mr. E. J. Lovegrove, engineer and surveyor:—
F. Cottrell ... £1,483
Gough and Co. ... £1,134
Willmott and Sons ... 1,295
Houghton and Son, 1,119
McCormick and Sons ... 1,288
Stroud Green* ... 1,119
[Accepted]

[Surveyor's estimate, £1,100.]

THE BUILDERS' JOURNAL ARCHITECTURAL RECORD

WITH SURVEYING AND SANITARY SUPPLEMENTS

An Architectural Causerie.

Royal Institute of Painters in Water Colours.

AN hour, or at most an hour and a half, is as much as anyone can profitably spend in a gallery of pictures, displayed, as they always must be, in a way that renders contemplative

The heat is the unifying element, and the theme has inspired the painter. Accounting this the best of its kind, we seek pleasure elsewhere: in Mr. Sainton's delicately outlined incarnations, for instance. We have, perhaps, in these paintings the originals of his silver-points. It is primarily as drawings that his works claim attention, and exclusive as the idealist is of all but perfected form it goes without saying that his line is the Line of Beauty. Enough has been said, it is hoped, to satisfy the reader that we are not limited by prejudice to any one master or school. The landscapes, being innumerable, are the hardest to speak of, for tradition has hallowed particular ways of presenting land and seascapes to the eye, and we may look at some hundreds without finding anything better to say than that Constable appears to be followed too often by artists, who might, if only to give us a change, either adopt

Railway Guard, Lucknow," No. 202; by Patrick Lewes Forbes, "Church Row, Hampstead," No. 547; and, finally, by Mr. Miller Smith, "The Hall-in-the Wood, near Bolton," No. 133. Returning now to the West Room, and taking things as we find them, we congratulate Miss Jessie Hall on a sheepscap, No. 7; Mr. W. Hatherell, R.I., "Ventimiglia," No. 11; Mr. Thos. Pyne, R.I., "Look on the Stour," No. 18; Miss I. M. Harris upon her beautiful "Wild Flowers," No. 50; Mr. J. L. Grace, "The Fading Year," No. 61; Mr. L. Davies, R.I., "October Afternoon," No. 81; Mr. Wimperis, the Vice-President, "Bawdrey Ferry," No. 89; Miss Ch. Allan, "A Fishing Village," No. 104; Mr. John S. Potts, "Scene on the River Tyne," No. 124—a notably beautiful landscape; Mr. David Green, R.I., "Hill Tops," No. 131; Mr. T. M. Hay, R.S.W., "Mist, Wind, and Rain," No. 168. In the Central

HALF-TIMBER VIADUCTS IN CORNWALL. TREVEDDO.

pleasure impossible. The critic may do something, however, to help a poor friend to make the best of his time, supposing the said friend to be tractable. In the opinion of the writer, the most perfect picture in the West Room is by Ferdinand L. Gröne—"A Quiet Occupation," No. 66. In the usual subject piece, the figures make one picture and the landscape another, but here they are truly inseparable, and the diminutive creatures who would seem to be fishing are as much a part of the scene as the shivering leaves of the trees. If, while looking at 682 paintings, we returned again and again to this it was surely because of something most excellent in it. In point of style it could not be easily placed, as there is not a trace of self-consciousness in it.

or evolve a style of their own. There are nearly as many painters as pictures, some promising well, some already performing well, some even exceeding themselves, and some, not a few, declining. The editor's attention, had he been with us, would have been drawn to a number of paintings, the motive of which is supplied by buildings or parts of buildings, and this would not have been done had they not been deserving: by John Fulleylove, R.I., "The Hotel de Ville, Bruxelles," No. 1; by Bernard Evans, R.I., "From Gourdon to the Mediterranean," No. 113—a stupendously impressive achievement, whether the artist be regarded as a landscape painter or as architectural draughtsman; by C. W. Fothergill, "Cleve Abbey," No. 138; by William Simpson, R.I., "The

Gallery:—F. G. Cotman, R.I., "Homing Ferry," No. 189; J. P. Brinson, "Near Broxley, Kent," No. 238; Lexden L. Pocock, "Needle Point," No. 279. Here must we pause again, for the work is notably beautiful, of a quality rare and delightful—a single figure, seated, intent on the work in her hand; remarkable not merely for beauty, for this, whether present or not, is not what it is insisted upon. The spectator is reminded of Nicholas Maas and his sun-gladdened abstracts of life. H. I. Stock, R.I., "Miss Page," No. 323; Hugh Carter, R.I., "The Punch and Judy Show," No. 328—the best, it was thought, of his, and small as it is, delightful. Mortimer Mompes, R.I., "Maud," to be noted because it is clever:—not Tennyson's, one

would say, nor one to be loved in the usual passionate way. The East Gallery: Miss Abigail Morris's study of shells, 455, may be compared with other little marvels of Art which command respect in these rooms and elsewhere. As proving the painter a painter they compel admiration, and deserve the little room they require. Miss Anna Nordgreen, "Quand on est jeune," No. 477; the very quintessence of Love in its homeliest form—that of the devoted swain and the maiden. The story as told by the painter is epic in its simplicity. The influence is that of the best French school, and, given the subject, a more perfect picture could not be desired. H. N. Rheam, R.I., "My Lady Greensleeves," No. 489, is merely clever. Harold Swanwick, R.I., "The Duck Pond," No. 493; Edwin Hayes, R.I., "New Harbour, Hastings," No. 539; Hugh Carter, R.I., "Fishing for Eels," No. 560; Miss Anna Nordgreen, "In the Snow," No. 584; Val Davis, "At the Door," No. 613: a slight, maidenly figure, unassumingly, unspeakably, sweetly, appealingly, lovely and beautiful. A little picture and modestly priced, comparing the sum named with the pleasure the painter has given.

E. R.

One's Lady Client.

ALTHOUGH the ideals, and the sacred convictions of one's rosy youth have duly dwindled and vanished under the disillusioning and sophisticating process of the years, one still retains with desperate tenacity, a certain fond belief of bygone days, which clings upon the face of one's bald incredulity like the solitary periwinkle upon the face of a surf-denuded rock. With a dauntless, unflinching prejudice, one still holds by the conviction that all women are angels. Accordingly one's relations with one's lady client opened from the standpoint that she was an angel, an angel in disguise possibly, but still an angel. What more could one's lady client desire? Well, it seemed she desired hot water; her house renovated also, but in particular—hot water. One was then in the first blush of one's gilded youth, the client was a friend of a friend's friend, and, of one's folly, one consented to make the fitting of a hot-water service a labour of love plus "expenses." Those unfortunate "expenses" held the germ of future trouble. One's client looked upon them as a handsome concession, and at once regarded herself as conferring obligations instead of incurring them. One never got those "expenses" either, they were not proffered, and one was held by one's delicacy (and disgust) from asking settlement. However one was treated to an unconscionable dose of the hot water; there was no stint of that. It was delivered by post. One's lady client was a young and pretty grass widow with a smile of unfaltering sweetness. We met once briefly in town. Then, while she travelled abroad, her house in the East Riding was given over to the painters and plumbers. The work was duly completed before her return, which was signalled by the following letter:—

The Evergreens,
Wagform,
Yorks.

DEAR MR. ARCHITECT.—I came back the day before yesterday. The house, I am sorry to say, smells of paint dreadfully, particularly in the hall near the stairs, and my butler tells me he never knew paint to smell so before, and thinks it must be cheap paint, though I was anxious that everything should be of the very best, and I think it is a lot of money to pay if the paint is not good. This was one thing I wished to tell you about; another is the nursery wall-paper. My little girl was so terrified that I have had to turn one of the other rooms into a nursery for her, which is very tiresome. I don't think these high Art wall-papers are good for young, growing children unless she is very strong. Another thing about which I particularly wish to write is an extraordinary noise which occurs at times. It is a gobbeling noise and a creaking noise too, and my butler tells me it is the cistern, but it frightened my little girl dreadfully in the night, and the doctor tells me she is not very strong and must be kept quiet and away from all excitements,

so you may imagine my feelings at finding my dear child in tears at her nursery paper, and shrieking with terror at these really most alarming noises which disturbed us last night, and I must ask you to come down and see to it at once, or I feel we shall all be drowned in our beds. I shall be glad to put you up for the night. I think if I had known all the trouble this was going to be I would never have consented to the work being done. I will say nothing about the papering to the other rooms, I daresay I shall get used to them; but I particularly wanted a green paper in the dining-room, as I meant to tell you. I shall expect to see you tomorrow.—Yours sincerely,

ARABELLA CLIENT.

P.S.—Another thing I notice is that the workmen have walked across a corner of the lawn in their hob-nailed boots and worn a path; what Mr. Client will say when he comes back I really do not know! The lawns have always been the pride of his existence.

One was not amused by this letter in the least; one was deeply disappointed and a good deal annoyed; one's professional dignity sprang up on its hind legs, but remained amenable to discipline, and accordingly one replied in terms intended to be at once courteous and dignified; but in the light of intervening years the courtesy is rather that of a courtier on stilts, and the dignity nothing less than that of a Nabob in state on his elephant. One may quote the passage referring to the nursery wall-paper episode:—

I indeed regret to hear of your daughter's hysterical tendencies, and I hope and trust that she will grow out of them. I am afraid I have not had much experience in special medical work, so that if the new paper continues to disagree with your daughter's constitution, perhaps it would be a good plan to ask her medical adviser to prescribe a wall paper suitable to her case.

One excused oneself from travelling 200 miles to view a rusty ball-cock, and suggested a local plumber as an alternative. Nine days later one received the following from one's lady client:—

SIR,—Since I last wrote to you a can of paint has been discovered in the cupboard under the stairs. How we have all escaped being poisoned is a miracle to me. I found my little girl with a bit of PUTTY if you please—rolling it in her hands, poor child! The smell of paint is everywhere, and much worse than when I wrote before, it has even got into my wardrobe, which was in one of the rooms that have not been touched, and which I myself locked before I went away. I open it, to find everything I possess positively reeking of the workmen. My cook tells me they must have boiled their paints on the kitchen range, as it was splashed from end to end, and all our food tastes of oil and TURPENTINE. Pleasant, is it not? As you would not come, I had to send for the plumber. He came in the morning, and left a bag of tools, and went away again almost at once. In the afternoon he came again, with two more horrid looking men, and hung about the house in hob-nailed boots, covered with mud. Fancy my beautiful new stair carpets! Fancy black finger marks all up the wall! Next day, when I told them to put on some of Mr. Client's slippers, they only laughed, and were very, very rude, and went and danced in the kitchen, instead of attending to their work. They have gone at last, but I am hourly expecting the noises in the pipes to begin again worse than ever. They told my butler that all the work was badly done, and would be sure to go "rotten" soon. They said that when the pipes burst in the winter the water will bring down all the ceilings, and it will take months to get the house dry, which is just what I expected. Nice for Mr. Client's rheumatism! Nice for me, who had been to all this trouble and expense, and the servants all leaving and giving the house a bad name!—Yours faithfully,

ARABELLA CLIENT.

To this one made reply the least possible:

MADAM,—I have received yours of Tuesday last. I regret you should have felt it necessary to write in such terms.

One has heard no more of this, one's third client; except that she purses her lips when one's name is mentioned, and has spread the report that one is not "nice."

B. C.

THE foundation stone of the new Central National School, at Almondbury, has been laid. Mr. Lockwood is the architect.

EXAMINATIONS under the auspices of the Royal Institute of British Architects, for the granting of certificates of competency to students desirous of acting as district surveyors under the London Building Act and as building surveyors under local authorities, will be held at the Institute on Thursday and Friday of this week.

HEPWORTH CHURCH, Suffolk, has been completely destroyed by fire. The church was a quaint structure, dedicated to St. Paul, and stood on high ground. The building was of rubble and stone, chiefly in the Early English style, with thatched roof; it comprised chancel, nave, south porch, and a western tower, containing a clock and five bells.

PORTRAITS AS MONUMENTS.*

BY LIONEL CUST.

IF enquiry were made into the strict sense of the word "monument," it would be found that it meant little more than a record of memorial, which should be an incentive to thought. Monuments mostly took form in Architecture, sculpture, and painting. As an independent Art, painting was immeasurably younger than either sculpture or Architecture. The Art of ancient Egypt could be said to be monumental throughout. Into its monuments portraiture entered to a certain extent, but it was chiefly in the form of Architecture. No country in the world was so closely identified with the Art of sculpture as Greece, but the Art was long fettered by formula. Nothing seemed to be admitted in portraiture in ancient Greece that did not carry with it certain characteristics of beauty. It was not until the period when Greece began to decline that

HUMAN PORTRAITURE

began to assert itself. Rome, borrowing its Art from Greece, practised portrait sculpture to an extent which seemed to be quite fabulous, if the statements of the elder Pliny were to be believed. In Mediæval Art portraiture was little used, as the Art of that period was completely consecrated to God and the Church. But from the time of the Renaissance onward to the present day the statue and the bust had reigned supreme in monumental Art. They were often more than mere portraits; they were works of Art, and deserved to rank with the paintings of Titian and Holbein. It was not until the middle of the eighteenth century that the world of Art began to recognise that the Art of ancient Rome was a mere transcript from the Greek. One of the most unfortunate delusions which had beset portrait and artistic work for generations both in England and on the Continent had been the belief that Rome and Rome only, was the Mecca for artists. He did not hesitate to say that the complete subjugation of Art to the decadent sculpture of Rome was a great misfortune to the human race, and nearly proved its artistic ruin. With regard to

THE MARBLE BUST.

he maintained that unless it had a place fixed for it, and unless there was some intention for its creation, it was one of the most useless and meaningless things that an artist could produce. Fortunately for London in its crushing necessities most of its statues were in bronze. It was difficult for the sculptor ever to produce a real portrait; he could not go beyond certain limits in his Art, especially if he were working in marble. He could not catch the varying texture of the skin, the brightness of the eye. As a mere portrait and nothing else the marble bust could seldom be successful. Bronze gave a much more satisfactory statue than marble. Sculpture in terra-cotta was a branch of the Art which seemed to have fallen into a most unnecessary disgrace. By its use colouring could most usefully be brought into play. Portrait statues had before now been made of wood and coloured. Mr. Cust, in conclusion, dealt with memorial, official, and presentation portrait paintings, pointing to the necessity for the exercise of care in the use of portraits for such purposes. Monumental portraits should always contain something of national interest, and should always embrace the accessories. Such portraits should be painted for generations to come, and everything possible should be inserted to aid the knowledge of people who would be unacquainted with the mere individual portrayed.

* Resumé of a lecture delivered at the Royal Institution.

Her Majesty has decided to light Balmoral Castle by electricity. Pipes will convey water power from the Gelder, a stream running into the Dee, at a point about one and a half miles from Balmoral, and the current will be brought to the Castle by means of electric cables.

THE OLD CORNISH VIADUCTS.

BY CHARLES G. HARPER.

A RUN down the Great Western Railway Company's main line this spring, shows that new works of greater or less importance are being undertaken along almost the whole stretch of line between Paddington and Penzance. Very great energy is being displayed here, and, in fact, the Great Western has been changed, by the spirit of the present directors, from the most conservative railway in England to the most go-ahead. It is no secret that the Company has for years past been incurring a very heavy expenditure on the remodelling of the main line, and this outlay has never been heavier than now.

Very little of this has been observed by the travelling public between London and Exeter, although it may have been noticed that nearly all the stations on the way have been entirely remodelled or rebuilt; the most notable of the recently-completed ones being the fine new station at Bath, which has replaced the miserable darkling shed which for so long served that health resort, and served it badly. The most obvious works now on the way down to Exeter are those of the rebuilding of Reading station, whose extensive new platforms and great signal-boxes are rapidly taking shape, while the new road bridges are nearing completion.

Coming to the Exeter to Plymouth section, we find several other works in progress, and others to be still taken in hand before the Great Western can advertise an accelerated service to the Three Towns. At present the line below Exeter is scarce fitted for an express service. It is easy running up to Newton Abbot, with only two hindrances to speed on the way—the old wooden viaduct which carries the line over the unfathomable mud of Cockwood Creek, just below Starcross, and the stretch of single line which runs through the six tunnels between Dawlish and Teignmouth. At Starcross, Newton Abbot, and Totnes it is interesting to note there still remain the old engine-houses and towers of the atmospheric system by which the South Devon Railway—as it then was called—was worked in 1845. Cockwood Viaduct, which is only a few feet above the level of the Exe estuary, is about to be rebuilt, and it is understood that new tunnels will be driven through the red sandstone cliffs, side by side with those already existing between Dawlish and

Teignmouth. When this has been done there will be a double line all the way to Plymouth; but the steep gradients and sharp curves that begin directly after Newton Abbot is left behind are matters that must almost wholly remain. For the heavy work of pulling well-loaded trains over these, Mr. Dean's newly-designed locomotives—the "bull-dogs," as they have been called—are intended. When the great Blackford and Ivybridge half-timbered viaducts, together with the Cornwood and three small ones were rebuilt in granite some years ago, occasion was taken to flatten some of the curves, but they are still rather startling to the traveller, as the "Cornishman" goes swinging round them and ascending the long gradients which overtop the southern spurs of Dartmoor. There are still three old wooden viaducts in Plymouth and its neighbourhood—those of Westonmill and Keyham, and the Pennycomequick Viaduct—straddling crazily over the oozy mud of the Hamoaze creeks, but they are to be rebuilt shortly, and what the Londoner who travels down this way knows as "Plymouth" station is to be immediately taken in hand. "Mill Bay" is the official and local name for this dingy and inefficient station, which, with its cramped approaches and inadequate three platforms, has long been a reproach to the Great Western. Mill Bay is of that peculiar type of station to which Chippenham, Bath, Teignmouth, Newton Abbot, and Truro belonged. They have all disappeared now, with the exception of Chippenham and Newton Abbot, and it is even rumoured that that last eyesore's days are numbered.

The large amount of £70,000 is to be expended upon the new Mill Bay terminus and its approaches, and the contracts have been

placed with a local firm—that of Mr. W. T. Jinkin, of Plymouth. The new station will be half as large again as the present, and to this end a great deal of property has been acquired by the Company; Adelaide Place, on the east side, being entirely absorbed, together with portions of Buckland Streets and Union Streets. There will be five platforms in the new station, covered for a length of 360ft. with the now favourite "umbrella" roofs, while there will be an iron and glass covered lobby at the entrance to the platforms, occupying 8000 superficial feet. Another, and welcome, feature will be the provision, in the new station yard, of a covered way 110ft. long for sheltering vehicles.

A ramble round the existing buildings, extending to the bridge which carries the line across busy Union Street, is distinctly interesting, as showing some curious survivals, and it is little less than startling to observe that the permanent way across a 60ft. road still rests upon timber baulks, shod and bolted through with iron. This bridge is now being reconstructed without the traffic being suspended, and is being watched night and day. It was built in the days when it was considered a pleasing thing to mask the merely utilitarian purpose of a railway bridge with a classical treatment, and is consequently supported by a double row of peculiarly depressing iron columns cast in the Doric convention.

Below Plymouth the Great Western runs into Cornwall over the Saltash Bridge, opened by Prince Albert on May 3rd, 1859. No one now calls Brunel's great engineering triumph the "Royal Albert Bridge," as it was christened, and we may well rejoice that this is so, because names of that grandiloquent type cannot but detract from, rather than add to, our sense of the greatness of these works. The railway goes over this in single line, and only broadens out into two roads on entering Saltash Station at the Cornish end. The cost of this structure was £225,000, and it is scarce likely that the G.W.R., for the sake of a pedantic boast of having a double line all the way, will go to the huge cost of widening it, especially since the Cornish traffic is mostly of the "omnibus" character, as railway men term local trains stopping at most stations.

So industrious has the Great Western been, indeed, that very few of the picturesque half-timber viaducts are now left. The Cornwall Railway, from Plymouth to Truro, was opened in 1859, to which date these viaducts therefore belong. The line, all the way from Plymouth to Penzance, was originally a single one, save for sidings at the stations, and, when built, economy was the order of the day. Traffic was light in those times, and it sufficed to build the viaducts over the deep Cornish ravines partly of timber. These are of the inverted trestle kind, the wood used being American oak. The Coldrenick Viaduct, illustrated here, is a typical specimen of these daring designs of Brunel's genius, and shows how the woodwork was perched on the apex of the granite piers, built with picturesque irregularity, tapering upwards from the profound Cornish coombes. The piers are formed of plain walls built up to 35ft. below the level of the rails, those of the more lofty viaducts being strengthened by buttresses. The roadway planking rests upon three beams running longitudinally through-

HALF-TIMBER VIADUCTS IN CORNWALL. MOORSWATER.

out the whole length of the viaducts. Each of these beams consists of two pieces of timber, one above the other, fastened together by bolts and joggles. The piers are generally 66ft. apart, the longitudinal timbers being supported at four nearly equi-distant points in this space by straight timbers, radiating fan-shape on elevation from the tops of the piers. The feet of these supporting timbers rest on the masonry in cast-iron shoes, and are connected together by cross-beams and strengthened by iron tie-bars. The strength and elasticity of these apparently frail structures are remarkable, and, although they are being replaced by granite, they are going only because the line is being doubled, and because locomotives and trains very much heavier than any they were ever constructed to carry will be run between Plymouth and Penzance when the works in these districts are done. Coldrenick Viaduct came into disagreeable prominence in February, 1897, on account of the sad accident on the rebuilding works here, by which twelve men lost their lives. Coldrenick is not being rebuilt from the ground, but is rather being remodelled. This plan consisted first of rebuilding, course by course, the upper stage of each one of the thirteen piers in blue Staffordshire brick, with granite quoins. Traffic progressed as usual during the whole of these works, being delayed but very little by reason of Menheniot station being at the down end of the viaduct and by trains ordinarily going over it very slowly, either in stopping or starting. When all the piers had thus been rebuilt in their upper parts, the oak timbering was gradually replaced with iron lattice-girders. This work began from the western end and was carried on by stagings suspended beneath the roadway. The illustration shows this work in progress. It was by the failure of one of the beams to which a staging was thus suspended that the unfortunate men—twelve out of a gang of seventeen—were dashed from a height of 150ft. on to the rocks below. Last autumn another accident happened, at a viaduct half a mile beyond this spot.

Trevedda Viaduct—which we illustrate on our front page—is being replaced by an entirely new granite building, being built side by side with the old one. Trevedda Viaduct is being rebuilt under contract by Messrs. T. Relf and Sons. The old one is of eight spans, and goes in a long curve over Trevedda Woods. It is one of the most dilapidated examples, and is shod with iron, and shod with repairing pieces of wood tied by iron bars, and pickled with creosote in an amazing manner. Others being rebuilt up and down the line near by are those of Trevalga and Tresulgan. Two more below St. Austell are being replaced: those of Trenance and Gover; while those of Carkennick, Carvedras, and Truro, near Truro station, are presently to be begun. There are others on various branches. On the Totnes and Ashburton Railway, purchased outright by the Great Western Railway in the autumn of 1897, works of the kind are in progress; while on the branch from Plymouth to Yelverton two have been rebuilt, and another, the Ham Green Viaduct, is now in progress, between Bickleigh and Yelverton stations. The Falmouth branch from Truro is only 11½ miles long, but it has a surprising number of tremendous wooden viaducts, some of them 150ft. high—those of Ponsanooth, Collegewood, Penwithers and Treliever being specially notable.

Among the viaducts entirely rebuilt the great Moorswater Viaduct is remarkable. This was a work undertaken by the Cornwall Railway, shortly before it was bought out by the Great Western Railway, which already was the largest shareholder in the undertaking. This imposing work is 800ft. long and 150ft. high. Its rebuilding was begun in the early part of 1878, and it was opened on February 26th, 1881, and cost £30,000. It spans a beautiful and romantic valley just beyond Liskeard station, down which ripples the Looe River, on its way to the sea. Beneath its tall arches crouches the little railway station of Moorswater, on the mineral line of the Caradon and Looe Railway.

The country through which the line goes,

all the way from Plymouth, has called forth great engineering ability, but at the same time has made railway work immensely costly. And all this, and the improvements and extensions being made, or to be made, has been done in the face of the decay—the ruin, indeed—of two of Cornwall's three industries, copper and tin mining.

It is pleasing to be able to say that the Great Western is reaping already, and will hereafter reap more largely, the reward of such a policy. Cornwall is becoming one of the most favoured of resorts, and deservedly so, for it is at once the most beautiful, the most romantic, and the most perfectly satisfying of English holiday haunts, and at the same time, with its mild climate, a retreat from the rigours of winter.

THE ARCHITECTURE OF NEW SCOTLAND YARD.
